THE ADMINISTRATION BUILDING OF THE PUBLIC HEALTH SERVICE *

"The United States Public Health Service dates almost from the very beginning of our national history. It had its origin in a law enacted by the Federal Congress in 1798, which established the marine hospitals to provide relief and maintenance for sick and disabled American seamen. This was an important step in furthering the development of a great merchant fleet and the expansion of American commerce. Some of these hospitals cared for officers, sailors and prisoners wounded in naval engagements of the War of 1812."

The following is a very brief, general outline of the activities of the Public Health Service in fulfilling its important duties and responsibilities in protecting the health of the people:

Control of maritime quarantine, examination of immigrants, and inspection of passengers and crews of vessels and airplanes arriving from foreign ports, to protect the country from the importation of dangerous communicable diseases.

Control of interstate quarantine and health matters involved in interstate traffic to prevent the spread of communicable diseases between the States.

Study of the cause and means of propagation and spread of diseases of mankind, and the development of methods of prevention and control. In this work the Public Health Service maintains

Bureau of the Public Health Service—Administration Building

several research laboratories, the most important of which is the widely known National Institute of Health in Washington, D. C.

Supervisory control and licensing of the manufacture of biological and analogous products used in the prevention and treatment of diseases, to insure safe and standard products. These include the various vaccines, serums, antitoxins, arsenicals and similar preparations.

Study of mental diseases and drug addiction and the investigation of legitimate needs for narcotics.

Coöperation with State and local health departments, upon request, in all matters pertaining to public health.

Collection and publication of reports of disease prevalence in the United States and foreign countries, and compilation and publication of State laws and regulations and of court decisions relating to public health. Public health education and the dissemination of public health information.

"The affairs of the Public Health Service are administered by the Surgeon General and assistant surgeons general in charge of administrative divisions located in the Administration Building in Washington, D. C. On July 1, 1933, the personnel consisted of a total of 4911 persons. These include physicians, dentists, pharmacists, nurses, dietitians, laboratory technicians and other employees—a small army of trained personnel whose work is protecting the health and lives of the people of the United States. The career officers of the Public Health Service are commissioned by the President and they constitute a mobile sanitary corps whose members are available for service anywhere in the United States or foreign countries. Such a mobile corps is indispensable for the control of epidemics, quarantine duty and the prosecution of investigative studies."

F B KILMER WILL SETS UP PRIZES FOR PHARMACY

The will of Frederick Barnett Kilmer, filed for probate January 12th, includes bequests to the American and New Jersey Pharmaceutical Associations for prizes for meritorious work. Provision for the prize to be awarded by the AMERICAN PHARMACEUTICAL ASSOCIATION was made in a \$3000 trust fund, the income of which is to be applied by the ASSOCIATION to the rewarding of meritorious work in pharmacognosy. A fund of \$1000 was set aside for the New Jersey Pharmaceutical Association, the income to be awarded annually to the author of the best paper submitted to the association by a graduate pharmacist.

Mr Kilmer also left a \$5000 fund to St Peter's General Hospital, in New Brunswick, to perpetuate the nurses' library founded there in honor of Joyce Kilmer. Christ Episcopal Church in New Brunswick will receive \$1000 to be applied with other funds to the erection of a memorial to the Rev E B Joyce, former rector of the Church, and the income from a \$2000 fund for the preservation of historical data connected with Christ Church. Books and manuscripts in Mr Kilmer's library, which were written by his son, were left to Rutgers University, and other books, mostly scientific in nature, were left to the Philadelphia College of Pharmacy and Science, to St Peter's General Hospital, New Brunswick, and to the residuary legatees, all of whom are members of the family.

EDITOR'S NOTE Mr Kilmer became a member of the AMERICAN PHARMACEUTICAL ASSOCIATION in 1886. He was deeply interested in the Section on Historical Pharmacy, and in recent years the articles he contributed to the ASSOCIATION dealt with historical subjects.

Mrs Kilmer died December 31, 1931, a brief sketch may be found in the January JOURNAL, 1932, page 93, and a notice of Dr Kilmer's death appears in this issue of the JOURNAL.

THE NEW YEAR

LIFE is kaleidoscopic, it is ever changing—that is true under all conditions and situations and more so when affairs have been shaped so that some radical changes and directions seem necessary. The call is for master minds, seriously directed, not only to correct but watchful that the direction may be toward a betterment of a greater number. One of the evidences of life is that man is not ready to apply the Golden Rule in civic, social, financial, commercial and industrial problems, he seems to prefer business depressions and fosters social and ethical complexities. There is a willingness on the part of some to have others follow the right course or remain inactive and quiet until there is ponderous evidence of misdirection or until their own activities are affected. This is true not only in financial and commercial affairs, but in professional life, thereby the public suffers. We cannot hope for perfection, nor can we expect that there will be decided improvement unless fear and selfishness which retard progress will be overcome to a greater extent and make it possible to adjust matters.

We invariably enter a new year with hopes as well as uncertainties, realizing that efforts rightfully applied will make for progress, but that disappointments will be encountered. It is necessary that we have confidence in our fellow men and co-workers and it is with the determination to do our part that we venture upon new experiences. The best way to do business and advance professional service is to join with others in well-directed efforts.

SIGNS OF PROGRESS IN PHARMACY

ASIDE from the papers of the Scientific Section, every other division of the program of the AMERICAN PHARMACEUTICAL ASSOCIATION has shown a purpose to improve the practice of pharmacy. Reference is made to the researches relative to drug extraction, how and why there is variation in dosage of prescriptions. It has emphasized that the individual needs not only experience but a knowledge which enables him to understand what he sees and does. Series of articles dealing with the subjects have appeared in the JOURNAL and will, no doubt, stimulate the studies and result in a better understanding and realization of the importance of prescription practice, which in turn enables physicians to comprehend why the results of their prescribing may lack the uniformity which they expect, and gives them greater assurance that by closer cooperation, studies and conferences their practice will be improved, thereby better service is rendered the public. It should impress the fact that medicine, including dentistry and pharmacy, has other problems which concern members of these professions and it is gratifying to note that this spirit of cooperation is being strengthened.

There are promotions which apply especially to pharmacy in which the other divisions of medicine should take an active part and pharmacists should be helpful

in activities that enable the related professions to improve their service. Reference is here made to legislation, regulation of practice, revision of the standards, and changes that may come about through plans of President Roosevelt's Committee on Economic Security. In all of these the professions have an interest and to make them more effective and serve their purposes mutual studies by the professions are essential and helpful factors.

A NEW U S P X INTERIM REVISION OF THE ERGOT ASSAY

F FULLERTON COOK, CHAIRMAN, U S P COMMITTEE OF REVISION

THE first interim Revision of the Tenth Revision of the Pharmacopœia became official on January 1, 1934, and made certain changes in the assay of ergot and its fluidextract, also a modification of the manufacturing method for the fluidextract of ergot. In the first revision, the standard for ergot remained as in the original text, namely, a fluid preparation of ergot.

Since then, however, as a result of further investigation, it has been found desirable to adopt the alkaloidal salt, ergotoxine ethanesulfonate, as the official ergot standard.

For the purpose of insuring uniformity in the ergotoxine ethanesulfonate to be used as the official ergot standard, the U S P Board of Trustees has arranged for the packaging in ampuls, under nitrogen, of a carefully standardized lot of this alkaloidal salt. This ergot standard may be obtained through the office of the Chairman of the U S P Committee of Revision, 43rd Street and Woodland Avenue, Philadelphia, Pa.

By this new revision (No. 3) ergot will be required to possess a potency, per gram, equivalent to not less than that of 0.5 mg. of the official standard and the fluidextract must be adjusted to possess a potency, per cubic centimeter, equivalent to that of not less than 0.4 mg. and not more than 0.65 mg. of the standard ergotoxine ethanesulfonate.

The new monographs for ergot and fluidextract of ergot released in Interim Revision No. 3 on January 1, 1935, will become official and enforceable on May 1, 1935. Anyone desiring a copy of the "Interim Revision Announcement No. 3" may obtain it by addressing the Chairman, E. Fullerton Cook, 43rd Street and Woodland Avenue, Philadelphia, accompanying their request with *ten cents in stamps* to cover printing and distribution.

TERCENTENARY OF CHEMICAL INDUSTRIES

The year 1935 will mark the three hundredth anniversary of the establishment of the chemical industries in America. This anniversary will be celebrated by the American Chemical Society at its annual spring meeting during the last week of April of that year. Elaborate plans of the Society's New York Section, now well under way, indicate that this celebration will be a memorable one in the annals of American industry. Leaders in industry, finance and government will unite with the 17,000 members of the American Chemical Society to celebrate three hundred years of achievement of the American chemical industries—*Industrial and Engineering Chemistry*.

CONTINUOUS-READING TITRATION APPARATUS *

BY LAWRENCE H BALDINGER ¹

As an aid in presenting the subject of electrometric titration to a class in Analytical Pharmacy, a simple, inexpensive apparatus was constructed which was rugged enough to withstand frequent use by students, sufficiently accurate to emphasize continuous-reading electrometric titration methods. The apparatus as described can be assembled and wired in about three hours. All of the parts of the apparatus except the galvanometer and the milliammeter can be purchased from a radio dealer. The total cost should not exceed twenty-five dollars.

Discussion—The ordinary potentiometric titrations involve the reading and plotting of E M F values of the titration cell *versus* the milliliters of reagent used.

Fig 1—Continuous reading titration apparatus—V, electron tube, f, filament, p, plate, g, grid, T, titration cell, i, platinum indicator electrode, r, reference electrode, G, galvanometer, A, milliammeter, R₁, 25 000 ohm rheostat, R, 25 ohm rheostat, R₂, 85 ohm rheostat, E₁ 3-volt battery, E₂, 22.5-volt battery, E₃, 1.5-4.5 volt battery

Using the vacuum-tube apparatus no plotting is necessary unless desired for laboratory records. Instead of using a "balanced" circuit, *i e*, a circuit in which the E M F of the titration cell is balanced against a known E M F, the vacuum-tube apparatus employs an "unbalanced" circuit in which the course of the reaction is followed by observing galvanometer deflections. The theory upon which this apparatus is based, as well as a description of the newer wiring diagrams and uses, has been discussed in the literature (1). Inasmuch as some difficulty was experienced in duplicating results using some previously reported wiring diagrams,

the apparatus used in this work was finally assembled according to the method of Goode (*loc cit*). See Fig 1.

In addition to the ease with which the course of a reaction can be followed by observing the galvanometer deflections, this type of apparatus offers the advantage over the potentiometric method of titration in that the vacuum tube operates as a voltmeter which draws practically no current from the titration cell.

The heated filament (f) emits a stream of electrons which impinge upon the plate (p) setting up a current which activates the galvanometer (G). The current in the galvanometer circuit is made up of two parts: (a) the residual plate current and (b) that current which is a function of the grid bias developed by the electrodes of the titration cell. As the grid bias is changed the plate current is altered correspondingly depending upon the amplification factor of the vacuum tube. The residual plate current is so large in comparison with the current which is a function of the

* Scientific Section, A PH A

grid bias that it must be balanced by an equal and opposite current before a titration can be performed. An RCA Radiotron tube, type UX-199, drawing 0.04–0.05 ampere current at optimum operation, was used in this apparatus. A plate voltage of 22.5 volts was found to be sufficient for our work. Although additional grid bias was not needed in our experiments, C-battery terminals were provided on the panel. A 25-ohm variable resistance (R_2) acts as a galvanometer shunt. The current of the filament battery acting through a 25000 ohm variable resistance (R_1) serves to balance out the residual plate current and thereby to increase the sensitivity of the galvanometer. The D'Arsonval galvanometer¹ (G) is an inexpensive model having a resistance of 150 ohms and a sensitivity of 1.7 megohms at 12.5 em. The milliammeter (A) may be either a portable or panel type. See Figs 1 and 2.

In order to simplify still further the apparatus used, graphite and platinum, tungsten and platinum, and silicon carbide-platinum electrode pairs were used in place of the calomel half-cell-platinum assembly as proposed by previous workers. Inasmuch as only E. M. F. changes, not actual values, are observed with this apparatus, nothing is to be gained by the use of the calomel half-cell, provided that other electrodes will give consistent results. Brunnich (2) has employed the graphite and platinum electrode pair in neutralization reactions, connecting the electrodes directly to a galvanometer through a tapping key. Depolarization of the electrodes, an obvious result of prolonged key contact in Brunnich's assembly, is eliminated by the use of the vacuum-tube voltmeter. Furman and Wilson (3) have extended the use of the tungsten-platinum electrodes to oxidation-reduction titrations in a system analogous to that of Brunnich. Kamienski (4) showed that silicon carbide is an ideal substance to use as a constant reference electrode since its potential is almost independent of the chemical properties of the solution in which it may be immersed. The electrode systems were constructed in compact units in order to minimize breakage. See Figs 2 and 3.

Fig 2—Titration apparatus

For the titration of strong acid with strong base, weak acid with strong base, and iodine with sodium thiosulphate, it was found that the graphite and platinum electrode pair gave satisfactory results. Both the tungsten-platinum assembly and the silicon carbide-platinum electrodes gave good results in the titration of ferrous ammonium sulphate with potassium dichromate solution. In all experiments the electrometric titrations were checked using standard methods of analysis. The galvanometer deflections were plotted *versus* milliliters of reagent and curves were drawn through the points to show the course of the reaction. See Fig 4. In order to show the practicability of this apparatus in a course in Analytical Pharmacy, a number of ferrous iron preparations of the U. S. P. were analyzed, using the tungsten-platinum and the silicon carbide-platinum assemblies. Simultaneously with the use of the vacuum-tube apparatus, the titrations were checked, using diphenylamine

as an indicator In practically all of the titrations of these compounds, it was found that about 0.15 ml more of potassium dichromate solution was necessary to reach a diphenylamine end-point after the end-point had been indicated by the apparatus This is in agreement with the findings of Knop (5) and of Kolthoff and Sarver (6) who have suggested a correction factor for the oxidation of diphenylamine

Fig 3 —

Fig 4—Titration Curves—G, galvanometer readings, V, millimeters of reagent, I, hydrochloric acid with sodium hydroxide Graphite platinum electrodes II, acetic acid with sodium hydroxide Graphite platinum electrodes III, Mohr's salt with potassium dichromate Tungsten platinum electrodes IV, Mohr's salt with potassium dichromate Silicon carbide platinum electrodes V, Iodine with sodium thiosulphate Graphite platinum electrodes

Procedure—A weighed sample is treated according to quantitative methods up to the titration stage In the case of the ferrous compounds the sample is treated with 20 ml of diluted sulphuric acid (1 volume sulphuric acid with 4 volumes of water) and 15 ml of a sulphuric phosphoric acid mixture (75 ml sulphuric acid and 75 ml phosphoric acid diluted with water to 500 ml) Following this treatment the iron solution is diluted to 200 ml with water After immersing the electrodes in the solution the filament current is increased to 0.05 amperes and the galvanometer adjusted to obtain a deflection of 50 or 60 mm For best results the galvanometer shunt should be completely eliminated before beginning the titration Resistance R_2 should be used only to protect the galvanometer from sudden current changes while adjusting resistance R_1 After some practice the experimenter will have little trouble in obtaining the proper galvanometer reading prior to titration The reagent is run into the titration cell, at first, several milliliters at a time, and then more slowly, as the equivalence point is reached when galvanometer readings are taken

more frequently. During some titrations it may be necessary to readjust the galvanometer by means of resistance R_1 , especially if an instrument with a small scale is used. Vigorous stirring of the reaction mixture is necessary and is best accomplished by a small motor stirrer. It is well to wait thirty seconds after each addition of reagent to allow the galvanometer reading to become constant. The end point is characterized by a sudden large deflection, $\pm e$, dE/dV , the rate of change of the $E-M$ of the titration cell with a small change in concentration of the reagent approaches a maximum. It was observed that concordant results could be obtained when using the graphite or silicon carbide electrodes if, after each titration, the electrodes were immersed in cleaning solution, followed by thorough washing with distilled water. This apparatus is being used at the present time in these laboratories for the titration of alkaloids. A report of the work will appear shortly.

SUMMARY

1 The use of graphite-platinum, tungsten-platinum and silicon carbide platinum electrode pairs with a vacuum-tube titration apparatus has been suggested and illustrated.

2 The apparatus has been applied to the titration of some ferrous iron compounds of the U S P.

A NOTE ON THE ASSAY OF REDUCED IRON *¹

BY MARGARETHE OAKLEY AND JOHN C. KRANTZ, JR.

INTRODUCTION

Reduced iron has found a place in practically all of the pharmacopœias of the world. In some, the evaluation is expressed in terms of metallic iron and in others, the total iron content is employed. Winter (1) reviewed these various standards in 1913. The eighth revision of the United States Pharmacopœia employed the iodimetric process of assay. The ninth and tenth revisions employed the well-known mercuric chloride method. The British Pharmacopœia specifies the copper sulphate procedure, this method depends upon the displacement of the copper by the iron. In all of these methods, the ferrous or ferric oxide present in reduced iron remains unattacked by the reagents employed. In 1909 Frerichs (2) reviewed

* Scientific Section, A. Ph. A., Washington meeting, 1934

¹ From the Bureau of Chemistry, Maryland State Department of Health

the various assays and recommended the copper sulphate method on the basis of its being capable of a greater degree of precision

Owing to the fact that this method has been continued in the British Pharmacopœia of 1932, in which only 80 per cent of metallic iron is required, the authors decided to investigate the method and compare it with that of the U S P

EXPERIMENTAL

Three commercial grades of reduced iron were mixed and sifted through a number 100 sieve Assays were conducted by the method recommended for the U S P XI and by the following modification of the method of the British Pharmacopœia The difference between the U S P X and U S P XI methods lies in the fact that in the latter the mercuric chloride solution and reduced iron are heated together on a water-bath for ten minutes instead of boiling for five minutes

The modified British Pharmacopœia method is as follows

Transfer to a 100-cc volumetric flask about 0.6 Gm of reduced iron accurately weighed Add 30 cc of copper sulphate T S heated to its boiling point Shake the mixture frequently and vigorously during ten minutes Cool to 25° C and add sufficient distilled water to make 100 cc Mix thoroughly and filter To exactly 25 cc of the filtrate, add 20 cc of diluted sulphuric acid and titrate with tenth normal potassium permanganate Each cc of tenth-normal potassium permanganate corresponds to 0.005584 Gm of Fe "

The results obtained on the same sample of reduced iron by each of the two methods are shown in Table I

No	Modified B P Method	U S P XI Method
1	98.30	93.85
2	99.02	95.58
3	99.01	94.55
4	98.62	95.90
5	98.38	95.43
6	98.31	95.38
7	98.85	94.78
8	98.30	96.30
9	98.18	95.50
10	98.32	
11	98.90	
12	98.48	
13	98.00	
14	98.30	
Mean	98.49	95.25

The probable error of a single determination of the modified British process calculated by the formula $P.E. = \pm 0.6745 \sqrt{\frac{\sum v^2}{(n-1)}} = 0.23$ per cent By the U S P XI process the probable error is ± 0.48 per cent

Obviously the modified British process is less cumbersome than the mercuric chloride method and according to the analysis of the data set forth has advantage of a higher degree of precision The difference between the mean of the two determinations is approximately 3 per cent Since the purity of the substance is based upon the elementary iron content, it is manifestly important to determine which of the two procedures more closely approximates the theoretical value

In order to determine the absolute accuracy of the two methods a sample of powdered electrolytic iron was obtained through the courtesy of Dr George D Beal. This iron assayed between 99 and 100 per cent by direct titration with potassium permanganate after acid solution.

With the sample of pure iron both the U S P and the modified British methods gave results between 99 and 100 per cent.

A sample of iron was prepared by thoroughly mixing 95 parts of powdered electrolytic iron with 4 parts of ferric oxide, 0.5 part of ferrous sulphide and 0.5 part of ferrous phosphide. This mixture containing 95 per cent of metallic iron was submitted to analysis by both methods.

The results obtained on this adulterated sample are set forth in Table II.

TABLE II		
No	Modified B P Method	U S P XI Method
1	98.11	95.10
2	97.57	94.71
3	96.85	96.56
4	98.09	95.17
5	97.28	94.60
6	94.75	94.20
7	97.95	
8	94.18	
9	98.00	
10	98.40	
11	98.20	
12	98.20	
13	98.72	
14	98.42	
Mean	97.48	95.06

It is obvious that in the presence of these impurities the modified method of the British Pharmacopœia fails to give results which correspond closely to the absolute content of elementary iron.

CONCLUSION

1. The presence of ferric oxide, ferrous sulphide and ferrous phosphide in a sample of reduced iron vitiates the results obtained by the copper sulphate method. The mercuric chloride method gives absolute values in the presence of these impurities.

ASSAY METHODS FOR SALTS OF ORGANIC ACIDS *

BY RICHARD M. HITCHENS

The assay methods for alkali salts of organic acids have been for many years the subject of much discussion. A survey of the problems involved is given by Clark.¹

* Scientific Section, A. Ph. A., Washington meeting, 1934.

¹ Clark, *Jour. A. Ph. A.*, 15 (1926), 6.

The customary method of assay has been to ignite the salt to sodium carbonate which is determined by titration with standard acid. This method is subject to many sources of error, it is tedious and time-consuming. Ignition to sodium sulphate or to sodium chloride, which are determined gravimetrically, has been used by some investigators. Still others have isolated the acid by extraction and determined the acid gravimetrically or volumetrically. All of these methods require considerable time and are subject to many sources of error.

In 1927, Henville¹ described a new method of determining the cation in sodium salicylate and sodium benzoate. His method consists of direct titration of the aqueous solution of the salt with standard acid to a methyl orange end-point in the presence of diethyl ether to extract the organic acid as it is liberated. At a methyl orange end-point the solution is extracted with a fresh portion of ether and the titration continued to a second methyl orange end-point which is not affected by further extraction with ether.

Such a method is simple, direct, rapid and accurate. It furnishes the same information as does the conversion to sodium carbonate, sulphate or chloride but with a higher degree of accuracy and in a much shorter time.

The method was adopted by the 1932 British Pharmacopœia as an assay method for sodium benzoate and sodium salicylate except that bromphenol blue indicator was substituted for methyl orange.

In an attempt to simplify the method still further, Krantz and Schmidt,² working on the official monograph for United States Pharmacopœia XI, decreased the volume of the aqueous layer, increased the volume of diethyl ether and discarded the second extraction. As stated by Henville,¹ this procedure is valid for sodium benzoate, the end-point after the first extraction agreeing closely with that after the second. With sodium salicylate, however, the first end-point is somewhat indistinct and gives low results. Different analysts in this laboratory disagree as much as 0.5% on the first end-point, their results ranging from 99.0-99.5% on pure sodium salicylate. After the second ether extract the analysts agree well, obtaining values of from 99.8-100.0%.

By the proposed U. S. P. XI method, even pure sodium salicylate would assay only 99.5% as a maximum. It would seem advisable for the method of the U. S. Pharmacopœia to be revised, whereby two extractions are made, thus giving quantitative results. This should present no difficulties since the extra step is simple and rapid and requires no special equipment. The whole analysis may be completed in ten minutes.

The simplicity and accuracy attained by the Henville method for the assay of sodium benzoate and sodium salicylate suggests its adoption for other salts.

Although the method has been suggested only for these two salts it is in reality a general method of assay. Consider a salt MA. The reaction

can be carried to completion provided the following conditions are fulfilled

- (1) HA is sparingly soluble in water and readily soluble in some solvent immiscible with water

¹ Henville, *Analyst* 52 (1927) 149

Krantz and Schmidt *Jour. A. Ph. A.*, 52 (1933), 953

(2) HA is not too strong an acid, K_a less than about 2.5×10^{-3} . If much stronger than this complete liberation of the acid at a p_H value of 4, the methyl orange end point, can scarcely be effected without an excessive number of extractions.

(3) MOH is a base, the dissociation constant of which is greater than 10^{-6} . If lower, the end point, where MCl alone is present in the aqueous layer, will occur in too acid a solution for accurate determination of the end point.

(4) The salts MCl and MA are water soluble and insoluble in the immiscible solvent.

Any such salt MA, therefore, can be assayed by this method if a suitable solvent can be found for the acid HA, if HA is fairly water-insoluble and not too strong, and if the base MOH is not too weak. The choice of solvent, the indicator and the number of extractions necessary will depend upon the salt in question.

Sodium benzoate conforms well with these specifications. With $K_a = 7 \times 10^{-5}$, at a p_H value of 4, about 30% of the benzoate remaining in the aqueous layer will be present as sodium benzoate, the rest as benzoic acid. Benzoic acid is readily ether-soluble and only slightly water-soluble. From solubility data one would expect about 500 parts of benzoic acid in the 75 cc ether layer present in the U. S. P. XI analysis to one part in the 20-cc aqueous layer, or that the first end-point would be about 0.2% low. Thus one ether extraction should be sufficient. This is verified by experiment.

Sodium salicylate is slightly different. The dissociation constant of salicylic acid is about 1×10^{-3} . Thus at a p_H value of 4, only 20% of the salicylate in the aqueous layer is present as salicylic acid, the remainder is sodium salicylate. From solubility data there should be about 600 parts of salicylic acid in the ether layer per one part in the aqueous layer. But there are four parts of sodium salicylate per one of salicylic acid so that the combined salicylates in the aqueous layer may amount to 0.8% of the original sample. The first end-point will be low by this amount. A second extraction is necessary to remove the last traces of salicylates. This is borne out by experiment.

Ammonium benzoate and salicylate may be assayed by this method, the same arguments hold as for the sodium salts. The correct indicator would be methyl red. Unfortunately this dissolves in the ether layer. Methyl orange, however, gives results only 0.05% high, well within the limits of accuracy of the method.

The method is applicable to other salicylates such as magnesium, zinc, strontium.

It is applicable also to sodium barbital. Barbital has an acid dissociation constant of about 10^{-7} . Thus at a p_H value of 4, practically complete liberation of barbital has occurred, only 0.1% of the barbital remaining in the aqueous layer being present as sodium barbital. Even though fairly water-soluble and only moderately ether-soluble, one ether extract should be ample to give quantitative results.

It is applicable also to sodium phenobarbital. Phenobarbital has an acid dissociation constant of about 4×10^{-7} . Thus at a p_H value of 4, 0.4% of the phenobarbital in the aqueous layer is present as the sodium salt. Since phenobarbital is only slightly water-soluble and readily ether-soluble, one extraction should give quantitative results.

The method was tested experimentally on the above salts.

Materials—Sodium benzoate and salicylate, U S P products dried to constant weight at 100° C Ammonium benzoate and salicylate U S P dried to constant weight over solid sodium hydroxide Strontium salicylate U S P, magnesium salicylate, zinc salicylate, all hydrates and not dried before use Sodium barbital U S P dried to constant weight at 100° C Sodium phenobarbital N N R dried to constant weight at 140° C, according to the instructions of N N R¹ and A D M A²

Reagents—Diethyl ether U S P was found to be sufficiently neutral without further treatment N/2 hydrochloric acid was standardized gravimetrically by precipitation as silver chloride

The procedure was essentially that of Krantz and Schmidt³ except that after the first end-point had been reached the aqueous layer was drawn off through a separator into a second flask, 20 cc of ether added and the titration continued until a second methyl orange end-point was reached

The results are tabulated below The first column states the salt titrated, the second the assay after one extraction, the third the assay after two extractions Each analysis refers to a different sample of the salt

Salt	Assay after One Extraction	Assay after Two Extractions
Sodium benzoate	99 5%	99 7%
	99 6	99 8
	99 7	99 8
Sodium salicylate	99 5	100 0
	99 2	99 8
	99 2	99 9
Ammonium benzoate	99 0	99 2
	99 2	99 4
(by ammonia evolution)		99 1
		99 3
Ammonium salicylate	98 6	99 4
(by ammonia evolution)		99 4
Strontium salicylate	98 9	99 5
dihydrate	99 3	99 9
Magnesium salicylate	99 1	99 8
tetrahydrate	99 0	99 6
Zinc salicylate, trihydrate	101 0	102 2
Sodium barbital	99 9	99 9
	99 8	99 8
Sodium phenobarbital	98 5	98 5
	98 5	98 5

It is evident that sodium and ammonium benzoate give almost quantitative results with one extraction

All of the salicylates show the same type of results, the first end-point being at least 0 5% low, the second quantitative

The magnesium, strontium and zinc salicylates are all hydrates No attempt was made to dry them to the proper water content since the object in view was to determine the difference between the end-point after one and after two ether extractions The magnesium and strontium salts apparently contain the correct amount of water of hydration The zinc salt is slightly over-dried

¹ New & Nonofficial Remedies " American Medical Association

² American Drug Manufacturers' Association, 'Proceedings " 1933

³ Refers to footnote 2 page 12

Sodium barbital gives quantitative results even with only one extraction. This would be expected on account of the weakly acidic nature of barbital.

The sodium phenobarbital gives low results even when dried at 140°C . This is in accord with the results of the A. D. M. A.² who found the salt to form a stable hydrate from which it was impossible to remove all the water even at 140°C . That this method does titrate quantitatively the cation in this salt is demonstrated in the following series of experiments.

As a further check on the method the following experiment was carried out on pure salicylic acid, benzoic acid, phenobarbital and barbital. A suitable weight was titrated directly with standard alkali to a phenolphthalein end-point. The water was removed by evaporating under reduced pressure. The resulting salt was titrated as above and the titration compared directly to that obtained by neutralizing exactly the same volume of sodium hydroxide with standard acid to a methyl orange end-point in the presence of ether. In this manner the effect of possible impurities in the commercial salts was eliminated, the problem being the quantitative recovery of the standard alkali added. Entirely analogous results to those in the above table were obtained. With phenobarbital and barbital quantitative recovery was obtained with one ether extraction, with benzoic acid within 0.2% on the first extraction and quantitative recovery on the second, with salicylic acid at least 0.5% low on the first extraction but quantitative recovery on the second. These experiments act as an independent check on the accuracy of the method.

CONCLUSION

Henville's method for assay of sodium benzoate and sodium salicylate whereby the salt is titrated directly with standard acid in the presence of diethyl ether to a methyl orange end-point is a general method. It is applicable to water-soluble salts of the type MA where HA is an acid fairly insoluble in water and appreciably soluble in some solvent immiscible with water, where HA is not too strong an acid, apparent dissociation constant less than 2.5×10^{-3} , where MOH is not too weak, apparent dissociation constant greater than 10^{-6} .

The simplified assay method for sodium salicylate suggested by U. S. P. XI in which the end-point is taken after only one ether extraction, gives at least 0.5% low results, two extractions being necessary to give the correct assay.

DIGITALIS ASSAY ON NORMAL AND EXSANGUINATED CATS *

BY DAVID I. MACHT

(WITH THE TECHNICAL ASSISTANCE OF M. B. MACHT)

Pharmacologists in general recognize the cat method as the most useful means of assaying digitalis preparations. Variations crop up, however, even when this method is employed. To insure the most accurate and reliable data concerning

* From the Pharmacological Research Laboratory, Hynson Westcott & Dunning, Inc., Baltimore, Md.

assay of digitalis, a knowledge of the different factors affecting or producing such variations is very desirable. A number of these have already been discussed by various authors. Van Wijngaarden has suggested a mathematical formula for calculating the most reliable figures obtained from a given series of cat experiments (1). Macht and Colson have found that there is a marked difference in the killing doses of digitalis for vagotomized and non-vagotomized cats, respectively (2). Furthermore, the present writer has discovered that meteorological conditions, and particularly sudden changes in the barometric pressure, must be taken into account when assaying digitalis on cats (3). In the present communication, another factor markedly influencing the toxicity of digitalis for cats is described.

In this laboratory, fresh arterial blood is often obtained from cats for assaying or determining the activity of heparin, which is manufactured on the premises. Healthy cats are anesthetized with ether for this purpose. One cannula is inserted into the carotid artery and another into the femoral vein. From 30 to 60 cc of blood are drawn from the artery, and a corresponding volume of physiological saline is then injected into the animal through the vein. After this operation the animal is kept under anesthesia and used for some other physiological or pharmacological experiment. The author and his assistants found that when digitalis preparations were assayed on a cat in which blood (drawn off in the manner described above) had been replaced by physiological saline, the lethal dosage was much smaller than that required to kill a normal cat. The subjoined table exhibits the results obtained with five different lots of digitalis tincture assayed on normal cats, on the one hand, and on cats bled from one-half hour to one hour previously, on the other. In every case the animals were kept under light ether anesthesia,

TABLE INDICATING RESULTS OF ASSAY OF VARIOUS LOTS OF TINCTURE OF DIGITALIS

Normal Cats			Exsanguinated Cats		
Lot	Weight of Cat in Kg.	M L D —Cc. per Kilo of 1 10 Dilution	Lot	Weight of Cat in Kg.	Cc. of Blood Drawn

	2 9	14 4		3 2	60
Grand average		12 6 cc			9 5 cc

and the tincture, diluted 1 10 with physiological saline, was injected through the femoral or saphenous veins according to standard methods at regular intervals. The minimal lethal dose required to kill an animal is expressed in cubic centimeters of the 1 10 dilution. It will be noted that, even when the amount of blood removed

was as little as 25 cc, the killing dose of the digitalis was smaller in the exsanguinated cats than it was in the normal animals. What the explanation of this phenomenon is the writer is not prepared to say. It is certainly not due to any irritation or injury to the vagus and sympathetic nerves in the neck because control experiments were made on animals in which these nerves and the carotid arteries were removed without subsequent bleeding of the animal. The difference in toxicity would seem to indicate that the active principles of digitalis may enter into some loose combination with the proteins of the blood and render them less potent, but this has not been definitely established. The writer has always found that the most reliable figures are obtained when the tests for digitalis are performed on cats weighing not less than 2 Kg and not more than 3.5 Kg. The difference in the killing doses for exsanguinated and normal cats, respectively, is worthy of notice because the greater our knowledge of the factors responsible for variations in digitalis assay, the more reliable will be the figures obtained by investigators who take these factors into consideration.

METHODS OF IDENTIFICATION OF THE RHIZOMES OF IRIS VERSICOLOR L AND IRIS VIRGINICA L *

BY GEORGE M. HOCKING ¹

Most of the Blue Flag Root in commerce appears to come from the north- and central-eastern counties of Florida. The whole drug appears on the market in two forms, viz, "with fibre" (i. e., with the roots still attached to the rhizome) and "free of fibre" or "stripped". The species, *Iris versicolor* L., has always been named as the official source of the drug, *Iris versicolor*. Another species, *I. caroliniana* Watson, was recognized for the first time in the N. F. V., presumably on the basis of Farwell's statement (1) that in his twenty-five years' experience with crude drugs, Blue Flag Root had come almost entirely from this species. By the rule of priority, the name *I. virginica* L. takes preference over the name *I. caroliniana* Watson, and this revised nomenclature is used in this paper.

The statement is sometimes made (2), (3), (4) that Blue Flag Root is adulterated. Thus, Rusby (5), (6) says that this is probably the case to a large extent with *Iris versicolor* from the south-eastern states. In 1911, he (7) stated that much of the article appeared to come from *I. missouriensis* Nuttall, which is provided with a larger rhizome and was more readily and cheaply collected. The possibility of adulteration from this source now is remote since no Blue Flag seems to be collected in the areas where this species grows. In the south, collectors of and dealers in Blue Flag accept as genuine only the "red root," i. e., the rhizome reddish. 7

* Scientific Section A. Ph. A., Washington meeting, 1934.

¹ Instructor in Pharmacology, School of Pharmacy, The George Washington Uni.

broken across as opposed to "White Flag Root" which is whitish in section Farwell¹ states that in forty years of crude drug handling he had never observed adulteration of *Iris versicolor*

Small (8) groups *Iris versicolor* and *I. virginica* together with *I. Shrevei* Small² into the subgenus *Versicolores*. This closely related group of species is incorporated by Dykes (9) into the subgenus *Længata* of section *Apogon* of the genus, and this indicates a close kinship with the European *I. pseudacorus* L. so long known to materia medica. Members of subgenus *Versicolores* are distributed over eastern and central North America. Contrary to the statement which appears in many floras, e. g., Small (8), *I. versicolor* does not occur throughout all of eastern North America, but is restricted to the area, roughly, north and east of a line between Washington, D. C., and northern Wisconsin (10). *I. Shrevei*, if it is to be regarded as a true species and not identical with *I. virginica*, occurs in the Mississippi Valley region, while in the broad strip of territory between, reaching from the Great Lakes in the north to Florida in the south, occurs *I. virginica*.

METHODS

Because of the importance of Florida as a source of Blue Flag, methods were developed to distinguish rhizomes of the two most abundant Florida species, viz., *Iris hexagona* Walter and *I. savannarum* Small from the somewhat less common species *I. virginica* and from *I. versicolor*, which latter does not grow naturally in the state. In addition, distinctions between the two official species were developed. According to Hume (11), the seven species of *Iris* native to Florida may be classified into three distinct groups comprising (a) *I. tripetala* Walter, (b) *I. virginica* L., (c) *I. savannarum* Small, *I. Kimballii* Small, *I. hexagona* Walt., *I. Albispiritus* Small, *I. rivularis* Small.

I. tripetala was the only type not studied, but this species is not one likely to provide adulteration since its rhizome is said (12) to be small and cordlike.

Fresh rhizomes of *I. hexagona*, *I. savannarum*, *I. versicolor* and *I. virginica* were obtained from plants identified by botanists specializing in the genus. The rhizomes were thoroughly examined macroscopically and microscopically, first fresh, then in the dried state. To facilitate sectioning and study, the dried rhizomes were immersed in 15% chloral solution for a few days. It was found possible to distinguish the rhizomes of official species and also to distinguish between them on the basis of three or more of the following points: (1) Dimensions, (2) Color (a) external, (b) internal, (c) extract in chloral solution, (d) with vanillin-hydrochloric acid, (3) Fracture, (4) Comparison of cortical and stelar radii, (5) Count of vascular bundles in cross section, (6) Breadth of vascular bundles, (7) Diameter of intra-endodermal parenchyma cells, (8) Odor.

In determining rhizome diameter, cortical and stelar radii, and vascular bundle numbers, pieces of average to maximum thickness rather than those of smaller size (which may be immature) must be selected, whereas for the remaining data, this precaution is unnecessary.

The eight characteristics enumerated above will now be taken up singly

¹ Personal communication to author

² Anderson (personal communication) regards *I. Shrevei* Small as at most no more than a variety of *I. virginica* L.

1 *Dimensions*—Considerable variation exists in the length of pieces of the rhizome in commercial samples of the drug. Likewise, segmental and internodal dimensions are of little value since they vary greatly within the species and even for the individual plant because of varying environmental conditions.

Diametric values are of considerably more value in identification, although these again are affected by external conditions of growth. Of the group studied, *I. virginica* possesses by far the largest rhizome, only *I. savannarum* can compare with it in this respect, and the rhizomes of the two may be distinguished by other means.

AVERAGE MAXIMUM DIAMETERS OF FRESH* RHIZOME (IN MM)

	<i>I. versicolor</i>	<i>I. virginica</i>	<i>I. hexagona</i>	<i>I. savannarum</i>
Vertical	16	24	11	12
Lateral	21	32	13	19

* Immersion of dried rhizomes in 15% chloral solution gives comparable values.

2 *Color*—(a) A casual inspection of a sample of the drug from *I. virginica* gives the impression that the rhizome is distinctly reddish. A more careful examination, however, will show that *I. virginica* and *I. versicolor* are quite similar externally, but that in the former the rhizome has been sliced longitudinally (probably because of its large size), thereby exposing the bright red dish brown of the interior. The rhizome of *I. hexagona* is externally a rich reddish to dark purplish brown, that of *I. savannarum* similar but distinctly grayer.

(b) The rhizome of *I. versicolor* sectioned is dirty yellow to yellowish white to pale pinkish, that of *I. virginica* may be in places yellowish pink, but characteristically sections are dark red to purplish brown. In the other two species examined, sections are light yellowish almost creamy white, and this is said to be true of the four remaining species of Florida iris (12).

(c) When macerated for several days in 15% chloral solution, the liquid takes on a dark reddish brown coloration with *I. virginica* but becomes no more than greenish yellow with *I. versicolor*.

(d) As discovered for *I. pseudacorus* by von Lingelsheim (13), the rhizome of *I. virginica* is colored a brilliant red when treated with vanillin and strong hydrochloric acid, while that of *I. versicolor* is stained a pale pink. The rhizome of *I. savannarum* is only slightly stained by the same reagent. This test might perhaps be extended to other non official *Iris* species if satisfactory, it would be particularly useful for the examination of the powdered drug.

3 *Fracture*—With the exception of *I. virginica* the fresh rhizome of Florida *Iris* species break with a snap leaving a clean fracture (12). The fracture of *I. virginica* and *I. versicolor* rhizomes is tough.

4 *Comparison of Stellar and Cortical Radial Values*—In the table following, the cortical radius is expressed as a percentage of the total radius. minimum and maximum values were found and recorded.

(CORTICAL RADIUS/TOTAL RADIUS) × 100%

	<i>I. versicolor</i>	<i>I. virginica</i>	<i>I. hexagona</i>	<i>I. savannarum</i>
Minimum	16%	21%	30%	29%
Maximum	26%	38%	45%	56%
Average	21%	29½%	37½%	42½%

It will be noted that the maximum value for *I. versicolor* is less than the minimum value for the non-official species, whereas for *I. virginica*, although the variation is greater and the higher values tend to overlap values for non-official species, nevertheless the average value is quite distinctly lower. There is sufficient difference in the values for the official species to be of service in distinguishing between them.

5 *Count of Vascular Bundles in Cross Section*—The material, softened in 15% chloral solution, was cross sectioned in thin slices and stained with basic fuchsin. Counting bundles was rendered easier and more accurate by mounting on a slide, cutting into several strips, and using a lens magnifying ten diameters.

AVERAGE TOTAL COUNTS OF VASCULAR BUNDLES

<i>I. versicolor</i>	263	<i>I. hexagona</i>	181
<i>I. virginica</i>	240	<i>I. savannarum</i>	195

I. versicolor and *I. virginica* again show a relationship in the numbers of their vascular bundles, and have a distinctly higher count than in the other species examined

6 *Dimensions of Vascular Bundles and Parenchyma Cells*—The vascular bundles of *I. versicolor* and *I. virginica* are similar, both in size and composition, and are materially different from those of the non-official *Iris* species examined. The bundles in all were concentric, with the xylem forming a more or less complete ring around the phloem. In both official species, the individual elements making up the bundles, particularly the tracheae, are considerably smaller in cross section and more numerous than those of the other species. Only the smallest diameter of a bundle here called the breadth was determined.

AVERAGE VASCULAR BUNDLE BREADTHS (IN MICRONS)

<i>I. versicolor</i>	340	<i>I. hexagona</i>	154
<i>I. virginica</i>	336	<i>I. savannarum</i>	152

This again graphically illustrates the resemblance of the official species, and indicates, by a more than 100% increase in vascular bundle diameter, how markedly they differ from the non-official species studied.

7 *Odor*—The rhizome of *I. virginica* has a very distinctive and aromatic odor, somewhat resembling that of slippery elm, this distinguishes it from *I. versicolor*, in which the odor is slight and not distinctive.

APPLICATION OF METHODS

The methods just outlined were utilized in the examination of six commercial samples of the dried Blue Flag Root purchased on the open market and of four specimens of the green plants obtained from field collectors who took care to select specimens of the form identical with that which they collected commercially. Three of the latter were identified from the flower as well as from the rhizome (numbers 7, 8, 10).

No. of Sample	1	2	3	4	5	6	7	8	9	10
							Fresh			
Rhizome (mm) { aver lgth		76	115	76	75	56				
max diam	26	21	22	22	20	19	25	27	28	19
(Cort rad / tot rad) × 100%										
Horiz	32	20	17	30	21	16	21	22	30	34
Vert	37	36	32	38	34	27	31	27	34	41

Color with vanilin-HCl	Deep red	Deep red	Deep red	Deep red	Deep red	Slight red	Deep red	Deep red	Deep red	None

The foregoing data afford proof of the value of the methods used in determining identity in commercial samples of Blue Flag. The prime source of each crude drug sample was traced. It was found that four came from Florida (Nos 1, 2, 3, 4), and one each from the Carolinas (No 5) and from the middle west, possibly Indiana (No 6). No 6 was identified as from *I. versicolor*, the samples from the south as

from *I. virginica*, except in one instance (No 3), where the article from a northern dealer was found admixed with some *I. versicolor*.

The green plants were obtained from four areas in northeastern Florida, three (Nos 7, 8, 9) represented *I. virginica*, the fourth (No 10) was probably *I. savannarum*. The dealer handling this probably did not supply any large firms.

DIFFERENTIATION OF IRIS VERSICOLOR AND IRIS VIRGINICA

The monograph on *Iris Versicolor*, N F V, has been criticized because in it a single description is employed to describe the drugs from two species. Since they differ so markedly in some ways, it is preferable to describe them separately. The following description of the article as it occurs in commerce is suggested as sufficiently distinguishing.

Unground Iris Versicolor—Rhizome frequently branched, often provided with remnants of flower stalk, segments markedly constricted and thickly developed at intervals, elliptical in cross section at the enlarged portions, cylindrical at the constrictions. Up to 10 cm in length and 2 cm in thickness, with an average length of 5 to 6 cm and an average diameter of a little over 1 cm, not ordinarily sliced longitudinally, outer surface grayish brown, obscurely annulated with darker colored markings of leaf bases alternating light and dark, the lower with numerous circular root scars 1 to 2 mm across, and sometimes root remnants, particularly at the enlarged portions of the rhizome, coarsely wrinkled longitudinally especially upon the upper surface, fracture short, somewhat spongy, the broken surface with yellowish white to pale pinkish brown central cylinder and pale purplish cortex, the central cylinder exhibiting whitish vascular bundles distributed throughout and surrounded by a distinct endodermis, radius of cortex approximately one fifth of total radius. Odor slight, somewhat unpleasant, taste acrid and nauseous.

Structure—A more or less exfoliating epidermal layer of suberized cells with brownish walls, a hypodermis of one to three rows of cells with uniformly thickened strongly lignified walls some of which contain a reddish brown amorphous substance, a relatively narrow cortex of characteristic structure with ovoid or spherical parenchyma cells, large intercellular spaces some of the parenchyma containing starch, others a reddish brown amorphous substance, an endodermis of a single layer of cells with walls lignified and thickened on the inner and radial surfaces, a central cylinder made up of numerous nearly spherical parenchyma cells, between which are intercellular spaces not as large as those in the cortex, concentric vascular bundles occasional in the cortex, more numerous in the parenchyma of the central cylinder, mostly grouped toward its periphery, between 250 and 300 vascular bundles in cross section of rhizome, individual breadths averaging 340 microns.

Tests for Identity—In contact with chloral solution, this is colored no more than a greenish yellow, when the powdered drug is treated with vanillin and strong hydrochloric acid, it is colored a faint pink.

Unground Iris Virginia—Mostly simple branching much less common than in *I. versicolor*, up to 20 cm, on an average about 8 cm, in length and averaging 1 cm in thickness, segments separated by enlargements not as pronounced as in *I. versicolor*, cut into longitudinal pieces by halving or quartering, many broken pieces, outer surface grayish brown to purplish brown, but sectioned surfaces pinkish brown to dull red to purplish brown, giving entire drug a reddish appearance, more deeply annulated than in *I. versicolor*, the upper surface with prominent markings of leaf bases and often showing their fibrous remains, the lower with numerous root scars, fracture short and brittle, the broken surface light to dark reddish brown to dark purplish brown, outer portion of cortex sometimes yellowish, radius of cortex approximately three-tenths of radius of rhizome. Otherwise similar to *I. versicolor*. Odor pronounced, aromatic, reminiscent of slippery elm, taste acrid, astringent, disagreeable leaving hot sensation in throat.

Structure—Similar to that of *I. versicolor*. Vascular bundles of similar size, but somewhat less abundant, with an average count of 240 in cross section.

Tests for Identity—In contact with chloral solution, this is colored a dark reddish brown, when treated with vanillin and strong hydrochloric acid, the powdered drug is colored a brilliant red.

CONCLUSIONS

1 In revising them onograph for *Iris Versicolor*, N F V, the name *Iris caroliniana* Watson should be replaced by that of *Iris virginica* Linné which is more acceptable by the rule of priority

2 It is suggested that the section describing *Iris Versicolor*, N F V, be revised so as to distinguish between the drug from the species *Iris versicolor* L and *I virginica* L

3 In order to distinguish the official from spurious species of *Iris*, it is necessary to include in the monograph more specific histological data, in particular, vascular bundle counts and dimensions, and stelar and cortical ratios, and in addition, color of the drug and color reaction with vanillin and hydrochloric acid

4 *Iris Versicolor* from the southeastern United States does not seem to be generally adulterated at the present time

A STUDY OF A NEW SERIES OF URETHANES *

BY W A LOTT AND W G CHRISTIANSEN

As reported in another article, the authors have studied the hypnotic potency of amides and ureides whose acyl residues contain the characteristic grouping

In order to completely evaluate the grouping in this respect, it was decided to introduce it also into carbinol residues of urethanes, the carboxy group of acids from which the amides (and ureides) are derived being replaced by the carbinol $\text{—CH}_2\text{OH}$ group. The general formulas for the amides and the corresponding urethanes are as follows

* Scientific Section A PH A Washington meeting, 1934

Two such urethanes (carbamates) were prepared and tested for hypnotic activity against rats, they were found to be inactive

EXPERIMENTAL

1 *2-Methyl Cinnamyl Urethane*—14.8 Gm (0.1 mol) of 2-methyl cinnamyl alcohol was dissolved in dry benzene and treated with a 24% benzene solution of phosgene containing 9.9 Gm of phosgene, the latter was added dropwise with mechanical agitation, and external cooling. The initial temperature was 15° C, it rose about 5° C during this addition. After the temperature had fallen to 15° C, 12.1 Gm of dry, freshly distilled dimethyl aniline dissolved in 50 cc of dry benzene was added. This caused another moderate rise in temperature. After agitating for one half hour to complete the reaction, the reaction mixture was washed several times with water to remove the dimethylaniline hydrochloride. The benzene solution of the chloroformate was partially dried by shaking with anhydrous Na_2SO_4 , filtered, returned to the flask equipped with the agitator and treated for one hour with a large excess of 28% aqueous ammonia. The benzene solution of the urethane was washed successively with water, dilute hydrochloric acid, 10% sodium carbonate and finally again with water. By this time a white crystalline product had already appeared in the benzene layer. It was collected by filtration. When the benzene filtrate was dried and concentrated, an additional quantity of the urethane crystallized.

About 12 Gm of the crude material was obtained as snow-white crystals of melting point 130–131° C. After several recrystallizations from alcohol the product melted at 132–133° C.

Assay % Nitrogen found—7.46, calculated for $\text{C}_{11}\text{H}_{13}\text{O}_2\text{N}$ 7.33%

2 *2-Amyl Cinnamyl Urethane*—In an exactly analogous manner 2-amyl cinnamyl alcohol was converted to the corresponding urethane. In this case no product crystallized from the benzene solution until after it was dried, concentrated and chilled. From 19 Gm of the alcohol about 11 Gm of almost white crystalline product was obtained. After several recrystallizations from alcohol the product was snow white and melted at 77.5–78° C.

Assay % Nitrogen found—5.60, calculated for $\text{C}_{14}\text{H}_{21}\text{O}_2\text{N}$ 5.66%. 7 Gm of an oily by-product was obtained but not examined.

The alcohols from which these urethanes were prepared were obtained by reduction of the corresponding aldehydes using ethoxy magnesium chloride and the method described by Bogert and Powell (1). These authors also described convenient methods for the preparation of α -alkyl cinnamaldehydes (2).

Biological tests with albino rats indicated that these two urethanes had no hypnotic action in doses up to 2 Gm per kilo.

The biological tests on compounds reported herein were made in the Biological Research Laboratories of E. R. Squibb and Sons and we gratefully acknowledge their assistance.

SUMMARY

1 Two examples of 2-alkyl cinnamyl urethanes were prepared and found to be lacking in hypnotic activity.

2 Since the urethanes in general are not rapidly hydrolyzed in the animal organism, it is to be concluded that either

or

(b) the above urethanes are not readily resorbed.

Since in rats, the corresponding amides are active, the latter seems more probable.

E R SQUIBB AND SONS, BROOKLYN, N Y

THE ACTIVE CONSTITUENTS OF ERGOT A PHARMACOLOGICAL AND CHEMICAL STUDY *¹

BY MARVIN R THOMPSON²

During 1929-1930, the writer published a series of ten reports embracing a review of the literature on Ergot and also the results obtained in certain pharmacological and chemical studies on Ergot and its more important pharmaceutical preparations. These reports presented evidence, in confirmation of a rather wide-spread unanimity of opinion, showing, among other things, that

1 The amino bases of Ergot (histamine, tyramine, choline, etc.) could contribute little or nothing to the valuable therapeutic activity of the drug or any of its preparations

2 The valuable therapeutic activity resided wholly in the "total specific alkaloidal fraction"

3 Of the four then known alkaloids, ergotamine and ergotaminine were comparatively inert while both ergotoxine and ergotamine were indistinguishable in exhibiting intense activity by pharmacologic methods. Because of this great pharmacological activity, it was concluded that practically the full therapeutic activity of Ergot must reside in ergotoxine and/or ergotamine

4 Aqueous Extracts of Ergot were practically worthless because they were invariably deficient in ergotoxine or ergotamine and in addition were improperly standardized or not standardized at all

5 Fluidextract of Ergot, U S P, or similar alcoholic or hydroalcoholic preparations, contained alkaloidal activity in satisfactory amounts and hence such extracts were concluded to be superior to aqueous types of extracts

6 Either ergotoxine or ergotamine was completely representative of the valuable pharmacological activity of Ergot, and, therefore, either of these alkaloids should be complete therapeutic substitutes for Ergot or its crude extracts

Since publishing the above-mentioned reports, the author has continued to experimentally investigate certain phases of the ergot problem, largely because some of the most important conclusions regarding the activity and active principles of ergot have been based, by all workers in the field, upon experimental evidence of a much too indirect type, as for example, results obtained from experiments upon isolated uteri taken from non-pregnant and virgin animals. Such matters as absorption, changes in the uterus caused by pregnancy and the different stages of the oestrus cycle, and inherent differences in susceptibility between different animals, had been neglected by all pharmacologists up to 1930

* Abstracted from a dissertation submitted to the Board of University Studies of the Johns Hopkins University, in conformity with the requirements for the degree of Doctor of Philosophy reported in part before the Scientific Section of the annual convention of the AMERICAN PHARMACEUTICAL ASSOCIATION in Toronto August 25 1932, and in part at the annual meeting of the same body on May 10 1934, at Washington D C

¹ From the Department of Chemical Hygiene, School of Hygiene and Public Health, The Johns Hopkins University

² Emerson Professor of Pharmacology, School of Pharmacy, University of Maryland, Consultant Pharmacologist, Food and Drug Administration U S Department of Agriculture

Of the conclusions drawn up to this time, the most important one requiring further confirmation in the way of more direct experimental evidence had to do with the active principles. Ergotoxine and ergotamine salts were being offered to the medical profession as full and complete substitutes for ergot or its crude pharmacopoeial extracts. If these pure alkaloids were completely representative of ergot activity, there would be little justification for the continued use of the officially recognized crude extracts.

Earlier unpublished observations caused the writer to conduct a series of comparative experiments, using available salts of ergotoxine and ergotamine, and various crude extracts, for the purpose of determining whether or not the oxytocic effects of the purified alkaloids were actually the same as the effects produced by the crude extracts when administered to intact pregnant cats.

THE METHOD

The afore mentioned observations resulted in the selection of a method involving the use of pregnant cats because it was believed that of all experimental animals available for a large number of comparative experiments, the cat was the nearest possible approach to human conditions. For the adopted technique, anesthesia was necessary. Various barbituric acid derivatives such as nembutal, dial, amytal, phanodorm and phenobarbital, as well as ether, chloroform, chlorotone and avertin have been used, but since all of these anesthetics were observed to depress uterine activity if the anesthesia became deep, and since pregnant cats vary considerably in their individual susceptibility to anesthetics, it was found distinctly advantageous to employ anesthetics which permit of intravenous administration so that the very cautious injection of divided doses could be carried out in such a manner that a relatively light anesthesia could be insured. The sodium salts of the shorter acting members of the barbituric acid derivatives were, therefore, used for most of the experiments. The use of inhalation anesthetics was abandoned in the beginning because they required an objectionable amount of constant attention, and also because respiratory irritation often caused decidedly objectionable coughing or sneezing during the maintenance of light anesthesia. A tracheal cannula was used to further avoid such disturbances. A somewhat heavier anesthesia, effected with ether, was usually employed during the operative procedure, but thereafter a lighter level of hypnosis was maintained.

Following anesthesia, the pregnant uterus was exposed, and the movements recorded upon the kymograph by the use of the movable arms of a myocardiograph, tying the arms into opposite ends of one of the more longitudinally contractile segments of one horn of the uterus. The animal was not immersed in a constant temperature bath, but a large electric warming pad was employed, and the small area of exposed uterus was constantly irrigated with Locke Ringer solution at 37.5° C, the liquid dropping upon cotton partially covering the exposed part of the uterus. The entire procedure involves no hemorrhage.

A normal tracing was taken for approximately one half hour or more in all instances before administering the ergot preparations. In the interpretation of the tracings reproduced in the illustrations of results obtained by this method, the relative magnitude of the recorded uterine responses cannot serve to show the actual relative intensity of the uterine activity produced by the different ergot preparations. The comparisons must be made with reference to presence or absence of response and *the rapidity of the onset of the response only*. The *magnitude* of the contractions in the different tracings is dependent, not alone upon the *intensity* of response induced by the ergot, but upon the contractility of the particular area of the uterus included between the two attached arms of the recording apparatus. Different uteri and different parts of the same pregnant uterus vary greatly in contractile power, and it was quite impossible to accurately judge the contractility at the time of attaching the recording apparatus. Some of the uteri showing the lowest magnitude of recorded response were observed to show a much greater actual response than other uteri which responded feebly but recorded enormous excursions of the writing lever on the kymograph. This could readily be noted simply by visual observations of the exposed uterus.

Using this technique it is fully realized that the anesthesia and operative procedure results

in an "abnormal animal" The studies involved were, however, of a purely comparative nature with the surgical procedure and anesthesia operating as a more or less cancellable constant Nevertheless, to make this study as critical as possible, the effects of the various types of ergot preparations and chemical fractions or principles upon the strictly normal animal would obviously add to the significance of the results

Accordingly, use was made of an observation that representative extracts of ergot cause abortion in pregnant cats with phenomenal regularity, regardless of the stage of pregnancy The young are invariably born dead, not during the violent uterine activity caused by ergot, but following this activity by 6 to 24 hours In the very terminal stages of pregnancy the young are occasionally born alive This test is obviously not of an accurately quantitative nature but considerable importance has been attached to it as indicating ergot "activity" or "inactivity" in the fundamental studies which follow

COMPARISON OF THE ACTIVITY OF HYDRO-ALCOHOLIC EXTRACTS, AQUEOUS EXTRACTS AND AVAILABLE SALTS OF ERGOTOXINE AND ERGOTAMINE

1 *Pharmaceutical*—Suitable portions of 24 different lots of crude ergot, all assayed and found to be of U S P potency or higher, were mixed together to yield a total of approximately 5 Kg This material was ground and de-fatted by the U S P method An acid hydro-alcoholic fluidextract was prepared from 1 Kg by the fractional percolation method described elsewhere by the writer (1), a method involving the use of no heat whatever Percolation was continued until the combined percolates, when assayed by the modified (2) Broom-Clark method, exhibited an alkaloidal potency equivalent to 0.5 mg of ergotoxine ethanesulphonate per cc The volume of product was 3.790 liters This product, designated as Fluidextract No. 360, was stored in the refrigerator at 0° to 5° C, small portions being removed for use as needed

Another 1-Kg portion of the same powder was converted into an Aqueous Extract exactly as above, except that water alone constituted the menstruum Percolation was carried to the same volume as for the Fluidextract No. 360, i. e., 3.790 liters This product was designated as Aqueous Extract No. 361, and was stored in the same refrigerator as the Fluidextract No. 360 When assayed by the same method as the fluidextract, a potency equivalent to 0.19 mg of ergotoxine ethanesulphonate per cc was revealed It will be noted that this was considerably less than half of the alkaloidal potency contained in the hydro-alcoholic fluidextract *But it should also be noted that one cannot simply assume that aqueous extracts are alkaloid-free, even though they invariably contain less alkaloid than the hydro-alcoholic extracts*

Both of the above extracts were also assayed by the U S P Cockscomb method and by the colorimetric method of Smith (3) The writer, after several years of experience, holds little faith in the routine accuracy of the Cockscomb method unless an impossible number of birds are used It may be stated, however, that both extracts gave satisfactory cockscomb reactions in agreement with the potency revealed by the more accurate Rabbit Uterus method As to the colorimetric method, increased experience causes the writer to doubt the accuracy of the values originally obtained for the above extracts Both extracts gave the color reactions, however, and the fluidextract, as by the other methods, proved to possess a higher alkaloid content than the aqueous extract The colorimetric values were higher than the physiological values for both extracts Studies relating to the color reaction and its quantitative value will be reported later It is important

to point out that all three of these methods, which are believed to measure only alkaloidal activity, showed the presence of significant amounts of ergot alkaloids, even in the aqueous extract

2 *Pharmacological*—A number of experiments, recording the effects of oral doses of various ergot extracts as well as salts of ergotovine and ergotamine upon the uterus of lightly anesthetized pregnant cats, showed beyond doubt that both aqueous and hydro-alcoholic extracts, as well as the commercially available salts of ergotovine and ergotamine, were decidedly active in increasing the tonus and rhythmicity of the uterus. It was equally apparent that, viewing the results of four or more experiments upon each type of preparation, that the crude extracts, both aqueous and hydro-alcoholic, produced a uterine response which differed from that produced by either of the commercial alkaloidal salts. The chief difference was in the rapidity of the onset of response. Both of the above-described crude extracts acted much more promptly, usually well within ten minutes, and apparently more intensely than calculated equivalents of the ergotovine and ergotamine salts. The effects of the alkaloidal salts developed only after 30 to 60 minutes. In these earlier experiments, the extracts were administered undiluted, the alkaloidal salts in 1:1000 dilution, all in 1- to 2-cc. oral doses by stomach tube.

Viewing all experiments, however, disturbing discrepancies were occasionally observed, particularly with respect to the promptness of action. The effects of the crude extracts usually developed within ten minutes, while the effects of the ethanesulphonate and phosphate of ergotovine and the methanesulphonate and tartrate of ergotamine usually developed only after 30 to 60 minutes. But occasionally the effects of the crude extracts would be delayed until within the range of the time of action of the alkaloidal salts.

ABSORPTION FROM STOMACH AND INTESTINE

Realizing that anesthesia has a depressant effect upon gastro-intestinal function, it was thought possible that the active principles of ergot might not be absorbed from the stomach, and that the passage of the small dose volume into the intestine was delayed, thus accounting for these discrepancies in the rapidity of onset of action. This possibility was then investigated.

In a series of 9 experiments upon pregnant cats, following the usual technique, pyloric ligations were performed before oral administration of the ergot preparation by stomach tube. In not one instance did the characteristic effects upon the uterus develop, even though ridiculously enormous doses of crude extracts were given (up to 10 cc. of the extracts) within two hours. Upon the removal of the ligature, after approximately two hours, an effect would manifest itself promptly, especially if a dose of 10 or 20 cc. of water were administered. A representative experiment is illustrated by the tracing in Fig. 1.

It appears quite obvious, therefore, that none of the active principles of ergot, whether alkaloids or unknown substances, are absorbed to any significant extent from the stomach of the cat. Since the uterine activity could be made to manifest itself in no uncertain manner after removal of the pyloric ligature, it follows that absorption takes place from the small intestine. This was further confirmed in one experiment by leaving the pyloric ligature in place while a dose of 1 cc. of Fluidextract No. 360 was injected into the lumen of the small intestine by means

Fig 1—Cat late pregnancy uterus *in situ* Time in minutes Illustrating the lack of absorption of Ergot from the stomach and promptness of response of crude extracts following intestinal absorption Pylorus ligated prior to administration of first oral dose of an Aqueous Extract known to be active Note absence of oxytocic activity during two hours until ligature was removed, after which activity promptly developed Hydro alcoholic extracts in the same or even larger doses, likewise failed to show activity until the ligature was removed

Fig 2—Cat late pregnancy uterus *in situ* Time Same as Fig 5 The prompt (within ten minutes) response following the oral administration of 10 cc of F E Ergot No 360 plus water The influence of respiratory movement is evident in this tracing Magnitude of recorded contractions is low because of inclusion of only very small area of uterus between the two arms of the apparatus

Fig 3—Cat late pregnancy uterus *in situ* Prompt response following oral administration of 20 cc of Aqueous Extract of Ergot with water

Fig 4—Cat late pregnancy uterus *in situ* Delayed response following oral administration of large dose (15 mg) of ergotoxine ethanesulphonate in 20 cc water

Fig 5—Cat late pregnancy uterus *in situ* Time in minutes The delayed uterine response following the oral administration of a large dose (10 mg) of ergotamine methanesulphonate After approximately one half hour, however, pronounced activity is evident

Fig 6—Cat late pregnancy uterus *in situ* Prompt response following oral administration of 0.5 cc of de alcoholized F E No 365 with water

of a hypodermic needle. Uterine response resulted in $4\frac{1}{2}$ minutes, showing that intestinal absorption is quite rapid. Four similar experiments were performed using ergotamine ethanesulphonate and ergotamine tartrate instead of a crude extract (two experiments upon each salt). No uterine effects were noted in any case within two hours while the pyloric ligation remained, even though the oral dose was 5 mg in each case. Upon removal of the ligature, and administration of 20 cc of water, uterine response developed only after 30 to 60 minutes, again revealing a great difference between these alkaloidal salts and the crude extracts. The effects produced by ergotamine and ergotamine were indistinguishable by this method of study.

Because the comparative rapidity of onset of uterine action itself, following ergot administration into the gastro-intestinal tract, was the chief criterion to be used in distinguishing between the different constituents and preparations of ergot, it was necessary to use a procedure which would avoid the extremely variable delay in the passage of the dose from the stomach to the intestine. It was found that this variable could be satisfactorily removed by either of two ways. The drug could be injected directly into the lumen of the intestine, or the dose could be washed into the stomach with 10 to 20 cc of warm water. The volume of water appeared to cause a fairly prompt opening of the pylorus in most instances, thus providing for a prompt transfer of the oral dose to the intestine for undelayed absorption. The animals were fasted for at least 12 hours before use.

DOSAGE

The dosage administered to the cats was purposely large in practically all experiments. The method obviously has little quantitative value, but these studies were designed to simply determine presence or absence of oxytocic activity for various constituents and preparations of ergot, particularly with respect to type and promptness of action. The actual doses are indicated in the tables and illustrations.

DIFFERENCE BETWEEN NON-PREGNANT, PREGNANT AND POST-PARTEM UTERUS REGARDING RESPONSIVENESS TO ERGOT

The use of non-pregnant cats was abandoned in the beginning of this investigation because the uteri of such animals responded only feebly or not at all, regardless of the size of the oral dose of either aqueous or hydro-alcoholic extracts of ergot. As a consequence the studies embraced in this report have involved the use of pregnant cats exclusively.

The cats used were those in which pregnancy was so far advanced that it could be readily detected by simple observation of abdominal distension or by palpation. While a considerable individual variation in sensitivity to ergot was observed, thus making observations rather obscure, the writer is left with the impression, after observing the uterine effects of ergot upon more than 250 cats in various stages of pregnancy and at various intervals post-partem, that the sensitivity or irritability of the uterus toward ergot increases as the pregnancy proceeds toward the termination of the gestation period. Greatest sensitivity to orally administered ergot appeared to be immediately preceding, during and immediately after, labor. After

TABLE I—RAPIDITY OF ONSET AND INTENSITY OF UTERINE EFFECTS FOLLOWING ORAL ADMINISTRATION OF VARIOUS ERGOT PREPARATIONS TO LIGHTLY ANESTHETIZED PREGNANT CATS

Type of Preparation	Alkaloid Content, ¹ Per cent	No of Experiments	Oral Dose ²	Average Time Required (Approx) for Onset of Definite Uterine Effect Minutes	Intensity of Uterine Effect
Fluidextract U S P	0 050	6	2 0 cc	6	Marked
Fluidextract, U S P	0 120	2	1 0 cc	6	Marked
Fluidextract, U S P ³	0 075	2	2 0 cc	8	Marked

labor, the sensitivity appears to decline rapidly. By keeping a large number of pregnant cats on hand during the spring of 1932, it was possible to use two cats so nearly at term that true labor promptly followed the oral administration of 0.5 cc of a U S P Fluidextract of Ergot. Most powerful tonic uterine contractions started within five minutes in both cases, true labor developing in 35 minutes and 85 minutes, respectively. The uterine contents could not be expelled, of course, because of the abdominal incision. The violent abdominal muscular spasms forced uterus and contents through the incision to the exterior, throwing the recording apparatus out of adjustment and consequently ruining the kymograph tracings. Two other cats were used immediately after normal delivery was completed. A 0.5-cc dose of U S P Fluidextract, in two minutes for one and four minutes for the other, induced tonic contractions bordering on complete tetany. Uteri of cats used after the first day post-partem showed progressively decreasing sensitivity to ergot. After a week post-partem, the uterine response was observed to be very feeble, as in the case of the non-gravid uterus (3 experiments, 1 cat 49 hours post-partem, 1 cat 86 hours post-partem and 1 cat 196 hours post-partem). These few experiments cannot establish this important point conclusively, but if this general impression is correct even in part, there is a possibility that puerperal human patients may also gradually lose uterine sensitivity to ergot as the length

These few experiments cannot establish this important point conclusively, but if this general impression is correct even in part, there is a possibility that puerperal human patients may also gradually lose uterine sensitivity to ergot as the length

THE EFFECT OF ERGOT PREPARATIONS UPON NORMAL PREGNANT CATS

Every ergot preparation included in Table I caused abortion within 36 hours in at least one pregnant cat, when given orally by stomach tube in large but non lethal doses, *except histamine, tyramine, acetyl choline and the two preparations which proved to be alkaloid free*. The latter two preparations were without effect even in relatively enormous doses by either oral, subcutaneous or intramuscular administration, but those cats which failed to abort were subsequently (after three days or more) caused to lose their young by the administration of one of the other crude extracts or one of the salts of ergotamine or ergotoxine. Large necrotic abscesses were invariably produced by the subcutaneous administration of the larger doses of the crude extracts. By this method, therefore, it has been determined that the available salts of ergotoxine and ergotamine are decidedly active orally or parenterally. Likewise, hydro alcoholic and aqueous extracts were decidedly active orally or parenterally unless they were alkaloid-free as determined colorimetrically. This method does not permit of a critical comparison between the salts of ergotoxine and ergotamine and the active crude extracts, because all induced abortion in an apparently similar manner.

Ten mg of histamine acid phosphate, 50 mg of tyramine hydrochloride or 20 mg of acetyl choline, given individually or all in the same dose, by stomach tube, were ineffective in causing abortion (5 experiments).

The results of the investigation up to this point completely agreed with Moir's conclusion that the available salts of ergotoxine and ergotamine are not carriers of the full oxytocic activity of ergot. But inasmuch as it was possible to demonstrate the presence of alkaloids by their color reaction in every specimen which had proved active on either anesthetized or unanesthetized pregnant cats, it appeared quite probable that either the activity was completely due to the "total alkaloids" in some form or other, or else that the new unidentified non-alkaloidal "Moir principle" had disappeared with the alkaloids in the two inactive preparations.

THE DETERMINATION OF THE EXISTENCE AND CHEMICAL NATURE OF A NEW HIGHLY IMPORTANT SUBSTANCE IN ERGOT

Extracts of ergot were prepared by using alcohol, ether, chloroform, acetone and other organic solvents. All preparations, administered after removal of the solvent, were active in varying degrees upon unanesthetized and anesthetized pregnant cats. The activity invariably proved to be of the "prompt new type" rather than the "delayed ergotoxine or ergotamine type". A 50% hydro-alcoholic menstruum proved to be decidedly the more efficient extraction menstruum. This information was of little aid, however, and considerable effort was then expended in isolating various pigments and other constituents for test. These efforts were apparently in the wrong direction since none of the fairly pure pigments or other non-alkaloidal constituents carried significant activity. The details of these unfruitful experiments will not be presented, because later work in a new direction completely ruled out the numerous pigments or colored constituents of ergot as carriers of oxytocic activity.

Observations up to this point appeared to justify the conclusion that a 50% hydro-alcoholic menstruum is capable of extracting every trace of active material from ergot if percolation is carried far enough. Such an extract, of course, contains much more inactive than active material, but it perhaps would provide the best starting point for the purpose involved. Accordingly, 1 Kg of the defatted ergot powder described earlier in this report was subjected to exhaustive percolation with 50% alcohol by the fractional percolation method. Percolation was discontinued when the percolate could no longer be made to give the Smith color reaction. The

A significant difference between hydro alcoholic and aqueous extracts was not revealed by this method in spite of the fact that the colorimetric method showed a higher alkaloidal content in the hydro alcoholic extracts. It follows, therefore, that the aqueous extracts exhibited an activity entirely out of proportion to the alkaloid content, as observed by Moir in humans.

One decidedly interesting bit of information is furnished by these results. The only two preparations which proved totally inactive, even in ridiculously high doses, *were likewise the only two preparations for which a color reaction could not be obtained*, regardless of how much of each preparation was used for the color test. This point was critically investigated because the only two preparations failing to exhibit activity were those which actually proved to be completely alkaloid-free. It is very important to note that ergot preparations failing to give the color reaction, when the amount of preparation specified by Smith or by the B P Modification is used, actually need not be alkaloid-free. Good color reactions are obtained by

Fig 8—Cat late pregnancy uterus *in situ*. Showing lack of significant activity of "Alkaloid free" F E No 365 in very large oral dose (5.0 cc with water). Note also the prompt and intense effect following the 2.0 cc oral dose of the original F E No 365 (from which the "Alkaloid-free F E" was prepared) given over three hours later. Time in minutes.

Fig 9—Cat late pregnancy uterus *in situ*. The prompt response following the oral administration of 2.0 cc of "Total Alkaloidal Fraction" in 10 cc water prepared from F E No 365.

this method only when the alkaloidal content of the preparation at least approximately approaches the level specified by the U S P or the B P. To prove actual freedom from alkaloids, approximately four or more times the usual amount should be used, the ether extract should be concentrated to less than the usual volume, and the acid aqueous extraction should likewise be reduced to about one-fourth the usual volume. Then when the reagent is added, and no color develops, one can conclude that the preparation is actually alkaloid-free for research purposes. These facts were kept in mind in obtaining the alkaloid values of Table I, the colorimetric readings being taken only when the intensity of color for standard and unknown was brought within plus or minus 20% of each other by using appropriate amounts of the preparations to be tested.

Histamine, tyramine and acetyl choline did not contribute to the valuable activity of ergot preparations, as was concluded by the writer (6) in 1930, and by Moir (5) in 1932.

THE EFFECT OF ERGOT PREPARATIONS UPON NORMAL PREGNANT CATS

Every ergot preparation included in Table I caused abortion within 36 hours in at least one pregnant cat, when given orally by stomach tube in large but non lethal doses, *except histamine, tyramine, acetyl choline and the two preparations which proved to be alkaloid free*. The latter two preparations were without effect even in relatively enormous doses by either oral, subcutaneous or intramuscular administration, but those cats which failed to abort were subsequently (after three days or more) caused to lose their young by the administration of one of the other crude extracts or one of the salts of ergotamine or ergotoxine. Large necrotic abscesses were invariably produced by the subcutaneous administration of the larger doses of the crude extracts. By this method, therefore, it has been determined that the available salts of ergotoxine and ergotamine are decidedly active orally or parenterally. Likewise, hydro alcoholic and aqueous extracts were decidedly active orally or parenterally unless they were alkaloid free as determined colorimetrically. This method does not permit of a critical comparison between the salts of ergotoxine and ergotamine and the active crude extracts, because all induced abortion in an apparently similar manner.

Ten mg of histamine acid phosphate, 50 mg of tyramine hydrochloride or 20 mg of acetyl choline, given individually or all in the same dose, by stomach tube, were ineffective in causing abortion (5 experiments).

The results of the investigation up to this point completely agreed with Moir's conclusion that the available salts of ergotoxine and ergotamine are not carriers of the full oxytocic activity of ergot. But inasmuch as it was possible to demonstrate the presence of alkaloids by their color reaction in every specimen which had proved active on either anesthetized or unanesthetized pregnant cats, it appeared quite probable that either the activity was completely due to the "total alkaloids" in some form or other, or else that the new unidentified non-alkaloidal "Moir principle" had disappeared with the alkaloids in the two inactive preparations.

THE DETERMINATION OF THE EXISTENCE AND CHEMICAL NATURE OF A NEW HIGHLY IMPORTANT SUBSTANCE IN ERGOT

Extracts of ergot were prepared by using alcohol, ether, chloroform, acetone and other organic solvents. All preparations, administered after removal of the solvent, were active in varying degrees upon unanesthetized and anesthetized pregnant cats. The activity invariably proved to be of the "prompt new type" rather than the "delayed ergotoxine or ergotamine type". A 50% hydro-alcoholic menstruum proved to be decidedly the more efficient extraction menstruum. This information was of little aid, however, and considerable effort was then expended in isolating various pigments and other constituents for test. These efforts were apparently in the wrong direction since none of the fairly pure pigments or other non-alkaloidal constituents carried significant activity. The details of these unfruitful experiments will not be presented, because later work in a new direction completely ruled out the numerous pigments or colored constituents of ergot as carriers of oxytocic activity.

Observations up to this point appeared to justify the conclusion that a 50% hydro-alcoholic menstruum is capable of extracting every trace of active material from ergot if percolation is carried far enough. Such an extract, of course, contains much more inactive than active material, but it perhaps would provide the best starting point for the purpose involved. Accordingly, 1 Kg of the defatted ergot powder described earlier in this report was subjected to exhaustive percolation with 50% alcohol by the fractional percolation method. Percolation was discontinued when the percolate could no longer be made to give the Smith color reaction. The

combined percolates were concentrated, without heat, under high vacuum to 1000 cc. The material was in contact with nothing but glass-ware at any time. The resulting deeply colored material was acid to litmus, and was essentially aqueous because all but traces of the alcohol had been removed during concentration.

This material was highly active as shown by its induction of abortion in three pregnant cats following 0.5-cc oral dosage. It possessed the characteristic "prompt" type of oral activity as shown by three experiments upon lightly anesthetized cats, an example of which is illustrated in the tracing of Fig. 6. By the epinephrine-inhibition isolated rabbit uterus method, a total alkaloidal equivalent of 2.87 mg. ergotoxine ethanesulphonate per cc. was determined. This material was designated as Fluidextract No. 365.

It was reasoned that if the belief of Moir and Dale (5) that the total alkaloidal fraction did not carry the full activity of the drug were correct, the above fluid-extract should show a great deal of activity after complete chemical removal of the alkaloidal fraction.

Complete removal of the "total alkaloids" was accomplished by slightly alkalinizing (to litmus) 500 cc. of the Fluidextract No. 365 by cautious admixture with finely powdered sodium carbonate, and exhaustively "shaking out" with many portions of ether, until the deeply colored aqueous fraction could no longer be made to yield the Smith color reaction, thus showing complete freedom from alkaloid. The deeply colored aqueous fraction was subjected to vacuum to remove residual ether. This alkaloid-free aqueous material, 500 cc. in volume, was designated as the "Alkaloid-Free Fraction."

The combined ether portions were concentrated to a volume of 500 cc., under vacuum without the aid of heat. All operations were carried out in the dark. The 500-cc. ethereal extract was then exhaustively extracted in a separatory funnel with many small portions of 1% aqueous tartaric acid solution until the Smith color reaction could no longer be obtained when final portions of the tartaric acid extract were reduced to one-fourth the volume and the aldehyde reagent added. The ethereal portion which had thus been completely exhausted of alkaloids, was placed under vacuum to remove the ether and the small amount of residue was incorporated in the "Alkaloid-Free Fraction."

The acid aqueous solution of the total alkaloids was reduced to a volume of 500 cc. by high vacuum, filtered and the small amount of precipitate (color negative) was incorporated in the "Alkaloid-Free Fraction." At this point the solution of total alkaloids still carried a pale yellow color. It was, therefore, purified by again alkalinizing with sodium carbonate and exhaustively shaking out with ether. The aqueous residue, after removal of the dissolved ether, proved completely inert on the uterus of both the anesthetized and unanesthetized pregnant cat in two divided oral doses totalling 50 cc., and was therefore discarded. The ethereal solution of the total alkaloids after reducing the volume to 500 cc. *in vacuo*, was washed several times with 0.5% sodium carbonate solution to remove most of the remaining pale yellow color. The sodium carbonate washings were unable to yield the color reaction and were completely inert, after neutralizing with HCl, upon oral administration to two pregnant cats in doses totalling 50 cc. These washings were therefore discarded. The washed ethereal solution of the total alkaloids was then again exhaustively extracted with small, divided portions of 1% aqueous tartaric

acid solution until all of the "total alkaloids" were contained in the acid aqueous solution (using the colorimetric test as the guide) The ether was again removed from the alkaloid-free ether fraction *in vacuo*, and the residue incorporated with the "Alkaloid-Free Fraction"

The purified aqueous tartaric acid solution was freed from dissolved ether and concentrated to 500 cc *in vacuo* without heat, and filtered rapidly in the dark The resulting product was absolutely clear and colorless It should have contained essentially nothing but a solution of the "total alkaloids" of ergot in the form of their tartrates This aqueous solution of the "total alkaloids" was designated as the "Total Alkaloid Fraction"

The diagram of Fig 7 illustrates precisely what was done by the above chemical procedure to obtain the "Alkaloid-Free Fraction," containing essentially all of the extractives of ergot except the "total alkaloids," and the "Total Alkaloidal Fraction" which contained essentially none of the extractives of ergot except the "total alkaloids" in the form of their corresponding tartrates

THE PHARMACOLOGIC ACTIVITY OF THE "ALKALOID-FREE FRACTION"

(a) *On the Cockscomb*—Doses as high as five times the "threshold dose," or up to 30 cc per Kg, failed to produce a cyanotic reaction in the combs of a series of ten cockerels meeting U S P X specifications (as given under "Fluidextract of Ergot") The "Alkaloid-Free Fraction" was, therefore, concluded to be inert by this method of test

(b) *On the Isolated Uterus of the Virgin Guinea Pig*—Activity equivalent to 0.15 mg of histamine per cc was determined by this procedure The quality of activity was similar to that of histamine and was of a similarly transitory nature The activity was entirely similar to that described earlier by the writer (7, 8)

(c) *On the Carotid Blood Pressure of the Anesthetized Dog*—By intravenous administration, a transitory depressor effect similar to that produced by histamine was observed The character of the tracings was essentially identical with those reproduced in an earlier publication (9) The amount of histamine like activity was found to be, within the limits of experimental error, the same as observed on the isolated guinea pig uterus

(d) *By the Epinephrine Inhibition Isolated Rabbit Uterus Method* (2)—No activity could be demonstrated by this method

(e) *On the Uterus in Situ of the Anesthetized Pregnant Cat by Oral Administration*—Using the same technique described earlier in this report, no uterine activity was observed in four experiments, even after a total of 50 cc of the "Alkaloid-Free Fraction," representing 50 Gm of the original ergot, was administered to each cat during two and one-half hours Each experiment was terminated after four hours or more by administering orally a dose of 10 cc of the original unfractionated fluidextract This produced significant uterine activity within ten minutes in each case, showing that failure of the "Alkaloid Free Fraction" to induce activity was not due to unresponsive uterus Illustrated by Fig 8

(f) *On Unanesthetized Normal Pregnant Cats*—Oral doses up to 30 cc failed to interrupt pregnancy in eleven cats Two of the cats littered within four days after medication, but it is believed that the delivery was not brought on by the medication, as all of the young were born alive and fully developed In abortion induced by large doses of ergot the young are born dead unless the pregnancy is in the terminal stages The cats appeared to remain free from any other symptoms following even the largest oral doses

Subcutaneous doses of ten to fifteen cc failed to interrupt pregnancy in eight pregnant cats In the course of a week or ten days, enormous necrotic abscesses invariably developed around the site of injection These abscesses healed with extreme difficulty, requiring the passage of many weeks before spontaneous healing was complete Large scars remained after the healing

It is concluded from the above pharmacologic studies on the "Alkaloid-Free Fraction" that no significant valuable uterine activity of any kind was contained

in this fraction. The pharmacodynamic activity observed upon the isolated guinea-pig uterus and upon the blood pressure of dogs is of a histamine-like character, is inactive orally, and contributes nothing of a desirable nature to the characteristic action of ergot.

This eliminates all of the deeply colored constituents as well as a large amount of other non-alkaloidal components of ergot as carriers of the activity of this drug. The fact that this fraction is completely inert upon the uterus of the pregnant cat, while still containing constituents capable of causing severe irritation in small doses and enormous slow-healing abscesses from large doses by parenteral injection, is an important observation. Complete exclusion of these constituents from ergot preparations intended for hypodermic use is very necessary. It is believed that the abscess formation is probably due simply to the non-dializable or non-absorbable nature of the material, thus creating an effect similar to that caused by any irritant, unabsorbable body inserted under the skin or into the muscle tissue.

THE PHARMACOLOGIC ACTIVITY OF THE 'TOTAL ALKALOIDAL FRACTION'

(a) *On the Cockscomb*—Following essentially the U S P procedure in applying this method, using ergotoxine ethanesulphonate as the standard, this fraction was intensely active in causing cyanosis of the combs of ten cockerels. An activity corresponding to the equivalent of not less than 2.0 mg., and not more than 3.0 mg. of ergotoxine ethanesulphonate per cc. was determined.

(b) *On the Isolated Uterus of the Virgin Guinea Pig*—This fraction was definitely active by this method. Doses of 0.02 cc. to 0.2 cc. in 100-cc. tissue chambers induced strong contractions. It was impossible to assign any definite value in terms of a standard because repeated dosage to the same uterine strips produced progressively decreasing responses, showing that the drug gradually induced a paralysis and that this effect could not be washed out with sufficient ease to permit of any accurate estimation. The action was similar to that described for ergotoxine, ergotamine and crude extracts in a previous report (7).

(c) *On the Carotid Blood Pressure of Anesthetized Dogs and Cats*—A definite and prolonged pressor response was obtained in both dogs and cats by intravenous administration of 0.01 to 0.06 cc. per Kg. body weight. The response was indistinguishable from that illustrated in Figs. X and X-a, or as described for the "specific alkaloids" in an earlier report (9). Repeated dosage invariably led to a progressively decreasing response until the well known "epinephrine reversal" effect could be produced.

Oral doses of 1.0 cc., diluted to 20 cc. with warm water, failed to cause a significant change in the blood pressure of a cat. The pressor action, therefore, appears to be dependent upon the sudden appearance of relatively large amounts of the alkaloids in the circulation.

(d) *By the Epinephrine-Inhibition Isolated Rabbit Uterus Method* (2)—The potency by this method was found to be equivalent to 2.56 mg. of ergotoxine ethanesulphonate per cc. It will be noted that this value agrees fairly well with the value obtained, by the same method, for the original Fluidextract No. 365, from which this 'Total Alkaloidal Fraction' was prepared. The difference in the two values is barely significant, and shows that the loss in alkaloidal activity sustained in the chemical fractionation procedure was not great.

(e) *On the Uterus, in Situ, of the Anesthetized Pregnant Cat by Oral Administration*—After 31 experiments, following the technique already described, the writer is convinced that this "Total Alkaloidal Fraction," as well as three others prepared similarly, contained all of the significant characteristic uterine activity of ergot. The uterine effects usually developed well within ten minutes, differing from salts of ergotoxine or ergotamine in this respect. Figure 9 illustrates the promptness of action following oral administration of the 'Total Alkaloidal Fraction.' The promptness in action was indistinguishable from that observed following the administration of the original Fluidextract No. 365, from which this fraction was obtained. The promptness of action does, however, clearly show that the "total alkaloids" include a very important member in addition to ergotoxine or ergotamine.

(f) *On Unanesthetized Normal Pregnant Cats*—The "Total Alkaloidal Fraction," in oral doses of 0.5 to 2.0 cc, interrupted pregnancy within 24 hours, in twelve cats in various stages of pregnancy. Subcutaneous or intramuscular doses of 0.25 cc (4 cats by each injection route) likewise proved effective in terminating pregnancy. The young in all cases were born dead. Death of the cat occasionally resulted after abortion in experiments of this type, whether the preparation given was the "Total Alkaloidal Fraction," salts of ergotoxine or ergotamine, or any one of the active aqueous or hydro-alcoholic extracts. This was to be expected since most of the doses administered throughout this work were large.

The foregoing experiments upon the "Alkaloid-Free Fraction," and the "Total Alkaloidal Fraction," again demonstrate, as the writer previously concluded (7), that the isolated guinea-pig uterus method, as it is usually applied, is wholly unreliable as a means of evaluating the significant activity of ergot preparations, measuring chiefly the extremely variable and totally useless histamine type of activity rather than the alkaloidal activity.

GENERAL ANALYSIS OF RESULTS

Moir's observations upon human patients to the effect that, given orally, both aqueous and hydro-alcoholic extracts of ergot produce a much more prompt and more effective uterine action than the available salts of ergotoxine or ergotamine, have been repeatedly confirmed in this study upon pregnant cats. It follows, therefore, that the crude extracts owe their superior activity either (a) to an entirely new unidentified substance as concluded by Moir, or (b) to a naturally existing unknown ergotoxine or ergotamine compound or combination differing from the available salts or ergotoxine and ergotamine, and which is more readily absorbed from the intestinal tract than the manufactured alkaloidal salts. The writer feels that "(b)" had to be considered as a possibility in spite of the fact that Moir believed his active aqueous extracts to be practically alkaloid-free, because evidence has been presented in this as well as in an earlier report (8) showing that such extracts, although containing a deficiency of alkaloids, are usually not actually alkaloid-free and that they may contain sufficient alkaloids to account for definite activity when administered to humans in large doses as used by Moir.

A further analysis of the present results, however, rather definitely rules out "(b)" as a possibility, because of the repeatedly demonstrated fact that the "Total Alkaloidal Fraction" contained every trace of the characteristic activity of the original quantitative de-alcoholized hydro-alcoholic extract. Specifically, this "Total Alkaloidal Fraction" could consist of essentially nothing but an acid solution of the "total specific alkaloids," and these obviously in the form of their corresponding tartrates. This should preclude the possibility that the crude extracts owed their superior oral activity to a "mysterious" salt, or combination, of the two important well-known alkaloids ergotoxine or ergotamine, in spite of the fact that neither of these alkaloids have ever been proved to exist as such, or as simple salts, in crude extracts or ergot itself.

This leaves only "(a)" as a possibility. Their possibility developed into a virtual certainty when it was observed that salts of ergotoxine and ergotamine fell far short of being completely representative of the "total alkaloidal" activity of ergot, and also that the only other known important pharmacodynamically active constituents, namely, histamine, tyramine and acetyl choline, were not responsible for any of the characteristic oral activity of the drug. It may be concluded,

therefore, that Moir's and Dale's belief that a new highly important unidentified substance exists in ergot and its crude extracts (both aqueous and alcoholic), is confirmed by these studies. Quite contrary to their apparent belief, however, this new substance is shown to behave characteristically as an alkaloid, since the studies here reported show the presence of this new substance in the completely colorless "Total Alkaloidal Fraction," while the "Alkaloid-Free Fraction" proved to be devoid of any oral or subcutaneous activity of any significant type. The writer, therefore, believes that this new substance must be classified chemically as a new member of the "total specific alkaloids" of ergot, and that the activity of aqueous extracts, observed by Moir in human patients, is to be ascribed to "residual alkaloid."

(To be continued)

ANTIDOTES I GENERAL PLAN *

BY JAMES C MUNCH, AND F E GARLOUGH ¹

Men from the earliest times have endeavored to find ways of relieving pain or injury to themselves by means of spirits, charms, mysticism, and later by use of herbs and animals. In these efforts they found some herbs and later extracts that were either beneficial or deadly. It was also observed that the animals were either beneficially or injuriously affected by certain plants or animals which they ate, as is reflected in the names—cowbane, sowbane and wolfbane which are plants poisonous to cattle, swine and wolves.

The fatal effects resulting from the bites of animals brought about the first real effort to find antidotes to poisons, though some earlier knowledge had been gained of the counter-action of one drug upon another. In Homer's "Iliad" describing the Trojan War and the adventures of ancient heroes (Ca 1000 B C) many references are made to the wounds of the warriors being rubbed with a bitter, pain-assuaging root. Homer mentions 250 such cases. The earliest reference to a plant which was specifically believed to be an antidote for poison is found in Homer's "Odyssey," "Moli" or "Molu" which is apparently a species of *Allium* (*Allium moly*). In this case Circe's potion was a form-transforming drug, the effects of which moly supposedly counteracted.

Among the earlier writers on antidotes was the Greek, Nicander of Colophon (185-135 B C), the Court Physician to Attalus, King of Pergamum, who made studies of poisons on condemned criminals, a common practice at that period. His first work, "Theriaca," which was written in Greek verse, had to do with the poisons of animal bite and treatments of them. His second poem, "Alexipharmaca," tells of antidotes to poisons. In these he mentions twenty-two poisons, including aconite, cantharides, opium and conium. His chief antidotes include warm oil, mallow and linseed tea to excite vomiting.

The development of antidotes to poisons was greatly stimulated when, about the time of Mithridates (first century B C), poisons began to be extensively used

* Scientific Section. Madison meeting, 1933

¹ Bureau of Biological Survey, Glen Olden, Pa., and Denver, Colo

by certain ambitious or revengeful people to remove enemies or persons in the way of their personal advancement. The early effort was to develop a composite mixture of plant and animal materials that would protect against all poisons, bites of venomous animals and diseases. Several were put up in small cake or tablet form. A number of famous "theriaca," as the mixtures were called, were developed, containing from 37 to 250 ingredients guaranteeing protection. Mithridatum and two modifications of it were noted ones and appeared in the London Pharmacopœia as late as 1677 A D. A red clay, "terra sigillata," which was excavated with much ceremony from a certain hill on the Island of Lemnos on August 6th of each year was given some attention. Tests in July 1580, showed that such a product saved the lives of dogs given lethal doses of mercury sublimata, aconite, apocynum or neriium! Subsequent reports of tests on condemned criminals, however, failed to show any more value for this product than for the unicorn's horn.

William Heberden (1710-1801) in his "Essay on Mithridatum and Theriaca" (1745) did much to expose the superstitions and worthlessness of these curious concoctions, and to banish them from the pharmacopœias. Antidotal studies since have been upon a more scientific basis.

A series of investigations have been made on various poisons by interested investigators. Some trials have been made on animals, some on humans. A great deal of information has been collected and has served as a basis for the preparation of various tables of antidotes. However, our search of the literature has failed to show any consistent study of several types of poisons under similar conditions. It was, therefore, deemed advisable to institute a detailed investigation along this line, with the hope of developing successful methods of treatment of men and animals.

Since the literature reveals enormous discrepancies in toxicity figures, we have repeated many determinations to establish authentic figures. Injections are given various laboratory animals, worms, fish, frogs, mice, rats, rabbits, cats and dogs by mouth, subcutaneously, intramuscularly, intraperitoneally or intravenously. We are also collecting recorded toxicological data for men.

Searches of the literature are being made to learn the suggested antidotes. Pharmacological and toxicological studies are made to serve as a rational basis for therapeutics. Based on this knowledge, the efficiency of various procedures for protecting against the fatal dose, and multiples of the fatal dose are being studied. Studies are being made of antidotal processes that may change the chemical nature of the poison, or prevent its absorption, or aid its elimination, or counteract its physiological effects, so as to save the life of a poisoned animal. In our present studies we are paying most attention to those poisons (strychnine, thallium, cyanides, arsenic and phosphorus), used in the control of noxious rodents and predatory animals.

CONCLUSIONS

(1) Detailed searches of the literature are being made to determine the lethal doses of various poisons for men and animals, also their antidotes.

(2) Laboratory studies are being made to learn the value of various procedures suggested in the literature or developed in our work.

BIBLIOGRAPHY OF PHARMACEUTICAL RESEARCH

Compiled by A G DuMez, Reporter on the Progress of Pharmacy

ARGENTINE CONGRESS ON MEDICAL ECONOMICS

The first Congress on Medical Economics, organized by the Colegio Medico, a medical society of Buenos Aires, with the cooperation of similar medical societies of Argentina, was held in Buenos Aires. Important problems of collective medical practice were discussed. The members resolved to have a fixed tariff of fees, in relation to the economic conditions of patients who were classified as "poor," "justified to have a 60 per cent reduction in the schedule," and "able to pay the whole fee assigned in the schedule." They also resolved to have the City Hospital and similar institutions as centers for free medical care. There were various general motions, such as on the preparation of a national sanitary code. The existence of sanatoriums belonging to medical cooperative and medical mutual societies were approved. The members stated that the medical profession in Argentina is overcrowded and advised the limitation of the number of students to medical schools in

relation to the health demands of the country as well as the selection of candidates, according to their preparation and ethical background. The suppression of treaties of reciprocity with various countries was advised as an aim of securing practice for Argentine physicians, those graduated from Argentine schools as well as those returning home with diplomas from accredited schools in other countries.

Main entrance, Paris School of Pharmacy

THE STABILIZATION OF SYRUP OF HYDRIODIC ACID, U S P X

BY WILLIAM J HUSA² AND LYEEL J KLOTZ

The troublesome discoloration of hydriodic acid preparations due to liberation of free iodine was overcome many years ago by use of hypophosphorous acid. The darkening of Syrup of Hydriodic Acid due to decomposition of the sugar, however, has remained as a problem up to the present time (1). The sucrose in Syrup of Hydriodic Acid is rapidly hydrolyzed into dextrose and levulose (2), (3). Haussmann (4) ascribed the discoloration to the decomposition of the levulose formed in this inversion.

In syrups of hydriodic acid containing no hypophosphorous acid, the dextrose formed on hydrolysis of sucrose tends to reduce any free iodine formed. From this point of view sucrose has sometimes been considered as a preservative in the syrup. In Syrup of Hydriodic Acid, U S P X it would be erroneous to consider sucrose as a preservative because the hypophosphorous acid is fully effective in preventing the appearance of free iodine and the sucrose is the direct cause of the discoloration which occurs. Diluted Hydriodic Acid, U S P, will remain colorless indefinitely but as soon as sucrose is added to prepare the syrup an unstable preparation results.

From the above considerations it was thought that if Haussmann's views were correct, it should be possible to prepare a stable syrup of hydriodic acid by using hypophosphorous acid to prevent the appearance of free iodine and employing dextrose to give the preparation the properties of a syrup. Accordingly, syrups of hydriodic acid were prepared following the U S P directions with the exception that the sucrose was omitted and the following sweetening agents used: (a) dextrose, C P, 700 Gm per L, (b) dextrose, commercial,³ 700 Gm per L, (c) Glucose, U S P, 435 cc per L. The deterioration of these syrups was compared with that of a U S P Syrup of Hydriodic Acid in an accelerated test consisting of storage in an oven at 50° C in completely filled, tightly stoppered bottles. The results are shown in the following table.

As indicated in Table I, dextrose proved vastly superior to sucrose in the syrup stored at 50° C. Tests are in progress under various other conditions of storage. The C P dextrose gave a colorless syrup to start with while the commercial dextrose yielded a syrup of a slight yellow tint, the yellow color of the syrup prepared from U S P Glucose might be considered objectionable. By use of 700 Gm of dextrose per L, a product of excellent palatability was obtained.

According to present price quotations, a syrup prepared with the above quantity of commercial dextrose should cost about 3¢ more per liter than the present Syrup of Hydriodic Acid, a preparation containing C P dextrose should cost approximately 80¢ more per liter. Obviously, these slight price increases are negligible in comparison with the greater stability of the preparation.

About 35 years ago, Scoville (5) prepared samples of syrup of hydriodic acid using glucose in place of sucrose but the preparations clouded on standing. The clouding may have been due to impurities but was not observed in syrups made with any of the grades of dextrose used in the present study.

¹ Section on Practical Pharmacy and Dispensing, A. P. H. A., Washington meeting, 1934.

² Head Professor of Pharmacy, University of Florida.

³ For this we are indebted to the Penick and Ford Co., Cedar Rapids, Iowa.

TABLE I—DETERIORATION OF SYRUPS OF HYDRIODIC ACID CONTAINING VARIOUS SUGARS

Syrup Containing per Liter	Appearance of Syrups after Storage in Oven at 50° C.			
	0 Days	30 Days	60 Days	90 Days
450 Gm Sucrose (U S P Syrup)	Colorless	Yellow, contains ppt which re- dissolves on shaking	Dark brown liquid, copious black ppt which partially redissolves on shaking	Black solution, black ppt
700 Gm C P Dextrose	Colorless	Colorless	Colorless solu- tion, traces of ppt which re- dissolves on shaking	Pale yellow solu- tion, traces of ppt which re- dissolves on shaking
700 Gm Commercial dextrose	Slight yellow tint	Nearly colorless	Nearly colorless, traces of a black ppt which re- dissolves on shaking	Pale yellow solu- tion, traces of a black ppt which redis- solves on shak- ing
435 cc U S P glucose	Yellow	Yellow	Dark yellow	Very dark yellow

SUMMARY

It has been found that a Syrup of Hydriodic Acid of greatly increased stability can be prepared by replacing the sucrose in the official formula by dextrose. Dextrose of C P quality gives the best preparation although a satisfactory preparation results from the use of commercial dextrose.

A STUDY OF VEHICLES FOR MEDICINES *

BY BERNARD FANTUS, H A DYNIEWICZ AND J M DYNIEWICZ

IX FRUIT SYRUPS

It may seem strange that fruit syrups, as delicious as they are and as extensively as they are employed in cooking and for the flavoring of beverages, are not used to a greater extent as vehicles for medicines. Syrup of Orange is the only U S P representative of fruit syrups prescribed under its own name, and Syrup of Citric Acid, which is really an artificial lemon syrup, the only other one in the National Formulary we have the Syrup of Raspberry.

* From the Laboratory of Pharmacology of the College of Medicine, University of Illinois

The Syrup of Wild Cherry has quite an extensive use and might be taken to represent a sort of cherry syrup. When, however, one notes the kind of "wild cherry syrup" that is being palmed off for the official preparation, which if not actually delicious is not offensive, one is not surprised that so many people detest the taking of medicine. Some of these "wild cherry syrups" are turbid, some of them have undergone fermentation so as to be sour in addition to being bitter and highly astringent.

We understand that a new formula for syrup of wild cherry is being contemplated and it is hoped that it will be a great improvement over the present one. Nevertheless we wonder whether anyone who would have a choice between a nice syrup of cherry and the best possible Syrup of Wild Cherry would not unhesitatingly choose the cherry syrup. Thus when it comes to flavoring fountain drinks no one would think of using *Syrupus Pruni Virginianæ* to prepare a delicious and refreshing drink. Then why treat medicines with the less delightful flavor and taste and make it more offensive than it needs to be? We would therefore like to see the syrup of cherry introduced in the United States Pharmacopœia or the National Formulary, so as to give it a chance to compete with the Syrup of Wild Cherry for medical favor.

Possibly the reason why fruit syrups have not been introduced more extensively in official formularies is the difficulty of securing a uniformly satisfactory standardized product. Thus, for instance, the syrup of raspberry of the National Formulary V is unsatisfactory because it introduces the variable factor of fermentation, which is relied upon to destroy the pectin. Unfortunately, quite often the fermentation advances to the stage of vinegar production while the pectin is being destroyed, spoiling thereby the fine aroma of the raspberry. At other times a different form of fermentation causes the production of a musty odor which is likewise objectionable.

We therefore believe that it is very important to control the fermentation process which destroys the pectin bodies, in such a way as to have this fermentation limit itself to this effect without producing other changes.

With this in view we have experimented extensively employing various degrees of temperature, various degrees of avoidance of exposure to air even to the extent of excluding the access of air by a layer of liquid petrolatum. We have employed taka-diastase (which was recommended for this purpose), we have tried modifying the p_H value by addition of alkali and acid, all this without entire satisfaction.

We have secured the best results by adding 0.1% of benzoic acid to the strained fruit juice and permitting the mixture to stand at room temperature until a small portion of the filtered juice remains clear when one-half its volume of alcohol is added to it.

It seems that the presence of benzoic acid permits the activity of the pectase while inhibiting vinegar and other bacterial fermentation.

Objection might be raised to the presence of benzoic acid in these fruit syrups as advocated in the subjoined formulas on the ground that the use of such preservative in food products is illegal. Granted that the use of benzoic acid to be undesirable in food products that might be consumed in unlimited quantities and for an indefinite length of time, bringing the possibility of ingestion of a toxic dose,

such danger is not present in the use of a teaspoonful or even a tablespoonful of a less than 1-2000 solution of benzoic acid, several times daily for the usually limited time that medicines are taken. A great deal might be said on the subject of the joint responsibility of the prescribing physician and the dispensing pharmacist for the keeping qualities of the medicines dispensed. An investigation of the condition of medicines after they have been kept in the patients' homes for several days or longer might result in shocking revelations and in the wish that more medicines would be thrown down the sink than be forced down the unwilling throat of a struggling babe. It is well known that the keeping quality of syrups is entirely dependent upon their concentration. It is many times necessary to employ a certain amount of water to dissolve the medicinal ingredient and, unless this quantity of water be adjusted with extreme care which is usually not given it, the syrup becomes diluted to the spoiling point. The necessity of preventing this is obvious and it is respectfully submitted that the more general employment of benzoic acid or some other preservative in medicinal syrups be given more serious consideration.

That benzoic acid may introduce incompatibility is freely admitted. This is, however, no worse than the incompatibility, *e g*, of syrup of wild cherry with iron salts.

We therefore respectfully submit the consideration of the following three formulas for admission in the United States Pharmacopœia or the National Formulary.

SYRUPUS RUBI IDÆI

Syrup of Raspberry

Syr Rub Id

Press the juice from fully ripe raspberries through a flannel cloth. Dissolve in the raspberry juice 0.1 per cent of benzoic acid, and let the solution stand at room temperature until a small portion of the filtered juice produces a clear solution with one-half its volume of alcohol. Then clarify the juice by straining through flannel cloth and paper if necessary, and add to each 450 cc of the clarified juice 850 Gm of sucrose. Dissolve the sucrose in the juice by heat on a water-bath, cool and remove the scum.

Preserve the product in well stoppered bottles in a cool and dark place.

SYRUPUS FRAGARÆ

Syrup of Strawberry

Syr Frag

Press the juice from fully ripe strawberries through a flannel cloth. Dissolve in the strawberry juice 0.1 per cent of benzoic acid, and let the solution stand at room temperature until a small portion of the filtered juice produces a clear solution with one-half its volume of alcohol. Then clarify the juice by straining through flannel cloth and paper if necessary, and add to each 450 cc of the clarified juice 850 Gm of sucrose. Dissolve the sucrose in the juice by heat on a water bath, cool and remove the scum.

Preserve the product in well stoppered bottles in a dark place.

SYRUPUS CERASI

Syrup of Cherry

Syr Ceras

Pit fully ripe, dark, sour cherries. Rub the cherries through a wide mesh sieve and crush kernels in a grinder. Dissolve in the mixture 0.1 per cent of benzoic acid and allow to stand for

three days at room temperature. The filtered juice should produce a clear solution with one-half its volume of alcohol. Should a turbidity form, allow the mixture to stand until a portion of the filtered juice remains clear with one half its volume of alcohol. Press the juice through a flannel cloth and filter through paper, add to each 450 cc of the filtered juice 850 Gm of sucrose. Dissolve the sucrose in the juice by heat on a water-bath, cool and remove the scum.

Preserve the product in well stoppered bottles in a dark place.

The question of policy of recognizing both raspberry and strawberry syrups might possibly be raised because of the close relation of these flavors to each other. That, however, they have rather specific disguising qualities may become, it seems to us, evident from the following two prescriptions.

In the administration of small quantities of antipyrine as in children's dosage, raspberry syrup seems to give a better disguise than most anything else we have tried. The following prescription might bear this out.

R	Antipyrine	2 0
	Water	2 0
	Syrup of Raspberry, to make	60 0 cc
M and label	Teaspoonful in water every 2 hours (For child three years old)	
R	Sodium Citrate	15 0 Gr
	Water	7 5 cc
	Syrup of Strawberry, to make	60 0 cc
M and label	Teaspoonful in water every 2 hours	

In our opinion the same prescription with syrup of raspberry in the latter and the syrup of strawberry in the former is not quite as pleasant. Incidentally it might be mentioned that the citrates make raspberry syrup purplish, also that sodium citrate is less offensive to the palate than potassium citrate.

Syrup of cherry is an almost specific vehicle for the pleasant administration of acid as shown by the following prescription.

R	Diluted Hydrochloric Acid	5 0 cc
	Syrup of Cherry, to make	60 0 cc
M and label	Teaspoonful in 1/2 wineglassful of water after meals	

The only competitor of cherry syrup is raspberry syrup which also results in a delicious combination, as is shown by the following formula.

R	Diluted Hydrochloric Acid	5 0 cc
	Syrup of Raspberry, to make	60 0 cc
M and label	Teaspoonful in 1/2 wineglassful of water after meals	

The following two prescriptions might show a reason why syrup of wild cherry should be deleted in favor of syrup of cherry.

R	Codeine Phosphate	0 25 Gm
	Ammonium Chloride	5 00 Gm
	Water	5 00 cc
	Syrup of Wild Cherry, to make	60 00 cc

and the following

R	Codeine Phosphate	0 25 Gm
	Ammonium Chloride	5 00 Gm
	Water	5 00 cc
	Syrup of Cherry to make	60 00 cc

It will be seen that not only does the cherry syrup yield a more pleasantly tasting dose, but it is clear, while the syrup of wild cherry is turbid from precipitation of codeme tannate

Another comparison of interest is yielded by the following two prescriptions

R̄	Iron and Ammonium Citrate	5 0 Gm
	Syrup of Wild Cherry, to make	60 0 cc
and		
R̄	Iron and Ammonium Citrate	5 0 Gm
	Syrup of Cherry, to make	60 0 cc

The former is ink, the latter is merely dark, and not unpalatable, though we believe the Syrup of Cinnamon (new formula) furnishes the better vehicle

CONCLUSIONS

1 We advocate a change in the preparation of the syrup of raspberry consisting in the introduction of 0.1 per cent of benzoic acid in the fruit juice undergoing depectinization

2 We respectfully submit formulas for syrup of strawberry and syrup of cherry to consideration for admission by either the United States Pharmacopœia or the National Formulary

3 In the preparation of these other fruit syrups we also find that the presence of 0.1 per cent benzoic acid is of value in the removal of pectin while preventing vinegar formation and other fermentations

4 The syrup of cherry becomes much more highly flavored when it is made from the cherry juice that has been permitted to stand in contact with crushed cherry stones for several days, than if made without the maceration of the kernels

5 Syrup of raspberry seems to form a particularly useful vehicle for antipyrine in small dosage, syrup of strawberry for sodium citrate and syrup of cherry for diluted hydrochloric acid

HOSPITAL PHARMACY PRACTICE AN INNOVATION *

BY J. SOLON MORDELL ¹

In the latter part of 1925 a group of forty-five physicians and one pharmacist, members of the staff of the University Hospital and of the affiliated teaching hospitals of the College of Medicine, Syracuse University, embarked upon a program of rationalization of hospital drug therapy. This committee, representative of every branch of medical practice, and under the chairmanship of the Director of the Department of Pharmacology at the College of Medicine, was asked to investigate and to offer some organized plan to correct the existent drug situation.

Time, effort and finances were, and still are deservedly expended in improving diagnostic methods. Yet little interest has been shown in having drug treatment keep abreast of diagnostic progress. It was just such a problem which confronted this group in 1925. The condition was by no means a local one nor was it any

* Section on Practical Pharmacy and Dispensing. A. Ph. A., Washington, D. C., meeting 1934

¹ Pharmacist, Syracuse University Hospital of the Good Shepherd, Syracuse, New York

more serious than in other institutions. In many respects the movement was pioneer in nature and had little assistance in the way of precedent.

The efforts of this committee were consummated by the publication of the *Interns Handbook*¹. This book, which includes a description of emergency medical and surgical procedures, presents as one of its important achievements a drug list which exhibits drugs of proved therapeutic value and those which are felt to be the most efficient of their respective groups. The list is unencumbered by drugs which duplicate one another's action. Selections were made from the *United States Pharmacopœia*, the *National Formulary*, *New and Nonofficial Remedies* and *Useful Drugs*. Each item gained its place after it had been considered meticulously from every standpoint. Whim and custom were brushed aside and replaced by a scientific, common-sense attitude. The list is outstanding because of the scarcity of so-called "specialties." Preparations of official drugs under fanciful names are absent, as are items whose formulas are secret. Digitalis, ergot, cresol solution, liquid petrolatum and a host of others are deemed efficient *per se*. No sympathy is extended to embellishments of these items and the exorbitant price premiums entailed. In the rare instances where specialties were approved for admission, it was for the reason that they possess unique value not available in other preparations. In no case were specialties considered unless accepted by the Council on Pharmacy and Chemistry of the American Medical Association, thus, among other considerations, implies that formulas and standards are not secret. Similarly, wherever several manufacturers are bidding for the same item, preference is given to the product approved by the aforementioned Council.

The drugs are not grouped and classified according to therapeutic use, but listed alphabetically, by Latin title. The object was to induce a feeling of independence on the part of the prescriber in so far as application of the various drugs is concerned. It was felt that to suggest therapeutic uses would put prescribing on a cataloging basis and would discourage individual initiative in this respect.

The list of approved drugs included as a part of the material presented in the *Interns Handbook*, once officially adopted, laid the foundation for a reorganization of the entire system pertaining to the issuing of medicaments. It was not until 1929—four years after the establishment of the committee—that the *Handbook* was published and sold throughout the world. This wide distribution was possible because the material presented was not individualized to the group here but was made applicable for most hospitals. At this writing, the book is in process of revision.

During the four years of work on the original project, and for three years thereafter, the ground was being carefully prepared for reconstruction in the Pharmacy and throughout the hospital. After having secured the coöperation and sympathy of the heads of the various services, the work had to be done cautiously. A radical transplanting would have been disastrous to the whole plan. Each step had to be studied most carefully before it was put into operation. It should be noted that the guiding hand in all this work was that of a specialist in pharmacology, whose knowledge of drug markets as well as drugs is such as to make him constantly aware of the fads in medicine and to prompt him to assume a very critical attitude in all matters pertaining to the uses of drugs. Cooperation between a

¹ J. B. Lippincott Company, Philadelphia, Pa.

physician of this type, experienced in therapeutic problems, and a pharmacist possessing the necessary training and professional ideals, is prerequisite to the success of an undertaking of this nature

Finally, in the summer of 1932 the situation was ripe enough to permit a general housecleaning in the Pharmacy and in the drug cabinets throughout the hospital. This work involved not only the discarding of all undesirable drugs and drug preparations, but a careful revision of buying methods. By October 1932, the eight hundred drugs previously inventoried in the Pharmacy were reduced in number by over five hundred, leaving an inventory of approved items of less than three hundred. Comparing this with the inventory of one hospital which, in reply to a questionnaire by the chairman of the committee, reported seven hundred, while other large modern hospitals reported as high as seven thousand, and eight thousand,¹ one gets a picture of the inroads which the drug situation, if uncontrolled, may make in the hospital budget. There is an analogous condition in retail pharmacies. We can find sections of shelf space in most retail establishments, which have four or five, or even more items identical in composition. The pharmacist, unfortunately, does not entirely control the situation. He must maintain a stock which will prepare him to meet all demands.

The picture in the hospital here is different. Under proper guidance, useless waste is eliminated. The following is a list of regulations formulated to cover pharmacy service in this institution.

(1) The Pharmacy is placed under the supervision and direction of the Department of Pharmacology, in so far as the supply and standardization of drugs for use on ward cases is concerned.

"(2) This implies that the Director together with the Pharmacy Committee and the Pharmacist, possesses or is able to secure special information concerning drugs not easily accessible to others of the hospital organization, and will undertake to supply such information as occasion arises. Decisions of the Director, in conjunction with the Pharmacy Committee and the Director of the Service involved, on such matters as quality and integrity of drugs are to be on the same basis as those of the Heads of other clinical laboratories and are to be overridden only in emergency.

"(3) Additions and deletions of drug stock and changes in forms of drugs, shall be effected only after conferring with the Directors of the Services involved who may also recommend changes including the addition of new remedies. Advice and counsel may be obtained by them from the Department of Pharmacology whenever questions of the relative merits of these new remedies shall arise. However, when these newer preparations are used as a part of a controlled clinical investigation the Directors of Medicine and Surgery shall be responsible for such investigation and shall determine whether they shall be used the Director of the Pharmacy merely acting in an advisory capacity."

The above regulations are directly applicable in hospitals affiliated with a college of medicine, but the details may be adjusted to suit conditions in hospitals which do not have this connection.

Only those drugs which appear on the approved list may be prescribed for ward patients. The hospital ruling with regard to private patients is that drugs not regularly stocked are purchased especially, in the least possible quantity. The patient is charged with this quantity, even though it may materially exceed the

¹ "The Doctor and the Hospital Pharmacy" M. S. Dooley, M.D., director of Pharmacy and chairman of Pharmacy Committee, University Hospital and *Interns Handbook* Committee, *Bull. Am. Hosp. Assoc.*, January 1931.

amount actually needed. In many such cases visiting physicians have inquired as to the corresponding item regularly stocked and approved, and have ordered it. This has usually served to reduce the patient's bill considerably with no sacrifice of therapeutic efficiency.

Advice and information are available at the Pharmacy. Here, by virtue of contact with so many physicians, the hospital pharmacist has a splendid opportunity to demonstrate to them the proper uses of vehicles and flavors, to help them construct an efficient and palatable prescription. Of course, all questions out of the pharmacist's scope are submitted to the pharmacologist.

The following procedure is used in issuing drugs. Each division (fourteen in number) sends a partitioned wire basket to the Pharmacy in the morning. Empty stock containers are included in these baskets for refilling according to an order book which, after having been checked by the nurse in charge of the division, is counterchecked and signed by a supervisor of nursing. Special orders originating during the night, for prescriptions or items not regularly stocked, are also listed in this order book. Orders presented during the day are made out on separate requisition blanks, also signed by the nurse in charge and countersigned by a supervisor of nursing. These orders have, in addition to the desired item or items, a notation of the dosage to be given, which dosage is checked by the pharmacist. In instances where patients are leaving the hospital, a notation to that effect is made. The pharmacist, in such cases, places only the directions on the label, instead of the ingredients, as is ordinarily done with containers issued in the hospital.

As part of the reorganization activities, a radical change was made in the equipment for handling the various medicaments. Uniform screw-capped, green-glass vials are used for tablets, capsules and pills, instead of pasteboard boxes. Liquids are supplied in bottles of the ebony screw-cap type. All vials and bottles bear typewritten labels coated with a suitable label varnish. These containers are used for items which constitute the regular stock supply on each division. Since special orders are used only during the stay of the patient using them, they are issued in pill boxes or in corked bottles.

The official English title of the Pharmacopœia or National Formulary is used on all labels. If in neither text, an approved title is designated by the Pharmacy committee. This eliminates misunderstandings which arise when all sorts of common names and synonyms are used. The English, rather than the Latin title, is used for the reason that the nurses receive no special instruction in the Latin of pharmacy. Prominence is given throughout to the metric system.

Another step in the reorganization consisted in equipping all divisions uniformly. Since the hospital includes a school of nursing which rotates student nurses throughout the various hospital divisions, it contributes greatly to efficiency if the nurse does not have to be confronted with a different drug arrangement with each change she makes. The same applies to private duty nurses, since a change of patient may mean a change in location in the hospital. In addition to uniform arrangement and lay-out, a stock list is posted on each division. This list is valuable in several ways. *First*, it is a guide whereby each division may intelligently replenish its stock of drug supplies, *second*, it guides the new student nurse who is acquainting herself with the equipment of the particular ward concerned, *third*,

it controls any overloading of drug supplies throughout the hospital, and *fourth*—a matter of extreme importance—it serves as a control for the pharmacist, obviating waste in supplying the hospital, and enabling him to prepare his own stock intelligently

The most recent improvement effected has been the establishment of a central supply room in conjunction with the Pharmacy. This coordination does not usually exist in other hospitals. Under the new arrangement, the preparation and sterilization of solutions for parenteral use (such as Physiological Sodium Chloride and Ringer's), as well as the sterile dressings and various sterile trays (hypodermoclysis, intravenous, thoracentesis, paracentesis, etc.), are all carried out in this specially equipped room. Previously these operations had been performed in another division of the hospital, which division combines several different activities. The principal advantages sought by the change were, *first*, that of having the solutions prepared and sterilized under the supervision of the pharmacist, and *second*, that the unit would be specialized for the above-mentioned functions instead of being part of a conglomerate department. To effect this change, it was necessary to break through one wall of the Pharmacy into a room formerly used for excess stock of another department. As a result, the pharmacist is able to have constant surveillance of operations. The actual work is handled by a capable graduate nurse who has had special instruction and experience in this branch, while the pharmacist checks all operations and acts in a consulting capacity.

No little advantage has accrued to the hospital's financial situation as a result of the work done in the pharmaceutical end. Without sacrificing quality and efficiency, the replacement of costly specialties by their corresponding official drugs wherever possible, and the elimination of questionable patent medicines and nostrums has meant savings which, during the first year of operation of the new set-up, ran into four figures. It is quite certain that the second year's operations will reveal a considerably greater saving. It is important to note that the original primary aim was solely to rationalize drug therapy. The marked financial advantages which attend such a plan are, therefore, significant and satisfying.

Through the efforts of the AMERICAN PHARMACEUTICAL ASSOCIATION, the Council on Medical Education and Hospitals of the American Medical Association has initiated a move in the right direction with regard to hospital pharmacies.

As described in the April 1934, JOURNAL A. P. H. A., this Council has included in its "Essentials of a Registered Hospital" the one requiring that "the handling of drugs should be adequately supervised and should comply with state laws." The next step might well be that of establishing minimum standards in hospital pharmacies with regard to the nature of drugs handled. Much has been accomplished by the various medical groups concerned, with regard to standards for the operating room, the X-ray division, Physiotherapy, etc. In coordination with the AMERICAN PHARMACEUTICAL ASSOCIATION, the American Medical Association can do much to raise hospital pharmacies to the standards it has so admirably reached in the other departments of the hospital.

HISTORY IN THE DRUG STORE *

BY FRED B. KILMER ¹

Only in a limited way has history yet entered the drug store, and reached the man behind the counter. Eminent authorities from this ASSOCIATION have made highly important contributions to the history of pharmacy. For the most part, the pages upon which their records appear lie unopened and unread. The drug store man is not history-conscious.

Possibly, we have too much history. The progress of the world, the advance of science, of pharmacy and of the art of printing have evolved such a vast collection of historical material that the ordinary man finds life too short to even glance at them.

At times the druggist adopts Henry Ford's dictum that "history is bunk." He lets the past bury the past. With him events begin with the day he was graduated from college, got married or bought his first store. With many astute men nothing back of the World War, the depression or the NRA counts. This is a very human point of view for the man of to-day.

Few pharmacists have come to realize the uses and value of history. History is filled with lessons wherein we may learn to profit by the example and teaching of those who have gone before us in a world and a society not unlike the one in which we live. A knowledge and understanding of the realities of the history of pharmacy, and of the sale and dispensing of drugs, would help us to avoid many of the perplexities and catastrophes which now afflict us. The real lessons of history can be turned into dollars.

Rarely does the pharmacist reach to the delights of history. History helps us to know what our ancestors did—their troubles, their faults and their successes. It presents a story, a moving picture of life. History presents a marvelous play, with interludes, by-plays, changes of tone, changes of scene. One can find in history things that are romantic, picturesque, artistic and beautiful.

WRITTEN HISTORY

There exists an abundance of written history. The shelves of our libraries are loaded with historical volumes. The pages of our magazines are crowded with historical essays.

Even with this array, the fact seems to be that history is not yet a popular subject. Historical volumes cannot be counted among the "best sellers." Pharmaceutical history has not yet penetrated behind the drug store counter.

In part, this condition may be due to the mode and manner of its presentation. Right here the historically minded reader may well say to the writer "Who are you to tell us how we should write history?" Well, the author of this essay, with all humbleness, acknowledges that he is only a smatterer in history. He is not a historian. As a most humble student he, with due deference to the many eminent historians, offers the suggestions of a rather awkward beginner.

Much of our written history of pharmacy has been put together by able professional historians. Much of it has been written by the historical scholar. Facts,

* Section on Historical Pharmacy, Washington meeting, 1934

¹ Deceased

dates, footnotes, references and proofs abound in the pages. Often the author seeks to fortify himself against the criticisms of other historians. Readability and attractiveness are sacrificed.

Facts and dates, while highly important, taken alone do not make history. When the historian of the pick and shovel, the paleontologist, finds a skull or the bones of a jaw of a man who lived centuries ago, he must make the dry bones live. From the rocks under which his "find" was buried he determines the era in which his man lived. Hypothetically, he supplies the missing parts with plaster and putty. He lays on tints, and lo! we have a man who lived two thousand score years ago.

To record the history of pharmacy in any age we must take note of political and social events, the advancement of science, changes of policy, changes in taste, dress, ways of living, comforts, books, plays, popular songs and many things which make up and control human life and activities. In the midst of these, pharmacy and the drug store have lived and moved. History cannot be divorced from life.

To fulfil its mission, written history must be read. The reader must "read, mark and inwardly digest," and finally apply its lessons to his life and work. We may well believe that the history of pharmacy can be presented in such a way that it will reach into the drug store, and that the man behind the counter will live and move in its elevating air. The craftsmanship may well be left to our most capable producers of pharmaceutical history.

The AMERICAN PHARMACEUTICAL ASSOCIATION, through its museum and repository, will become a notable center for pharmaceutical history. Unfortunately, our pharmaceutical and trade associations have done but little along historical lines. A survey revealed that certain associations did not have on file complete copies of their own proceedings. Very meager were instances where there was an attempt to preserve historical data as to their organization. Associated effort in pharmacy contains an important record of the progress of the art. It is well worthy of preservation and use.

Pharmaceutical manufacturers, in a limited way, have found it wise to give attention to the history of their calling and their own organization. Some of them have installed a historical department or museum wherein are collected records, specimens of early productions, advertising and other data. Collections of this character have proved to be of service in the education of salesmen, detail men and others, as to the historical background of the institution. Notable have been the collections pertaining to general historical pharmacy acquired by certain manufacturers.

The retail druggist can, through history, draw patronage, gain reputation and increase his prestige. The use of historical elements will give a new and a different twist to drug store publicity. Above all other practitioners of the art of pharmacy, the retail druggist can turn history into cash. An economical method is through historical displays.

Drug store historical exhibits may consist of window displays, which may be moved to the interior of the store, and within the store moved from one point to another, forming a continuous show. A well-planned historical exhibit will hold attention from two weeks to a month. From one to twenty historical exhibits can

be given annually Through changes, historical exhibits can be repeated from year to year

The druggist may properly use his exhibits as an advertising medium Physicians, nurses, professional men, prominent citizens and college and high school classes are worthy of special invitations The local papers will be glad to give special write-ups of the show

Subjects with which to form an historical display in the drug store are abundant The history of the art of pharmacy may be shown by pictures clipped from magazines and books, through old-time implements and apparatus, side by side with modern types The map issued by the National Wholesale Druggists' Association, showing pictures of colleges of pharmacy, may form a background, giving the present-day status of pharmaceutical education College diplomas, certificates of registration and association memberships of the store owner and clerks will show that the personnel of the store stands high professionally One druggist excited curiosity by having his clerks, during his exhibits, wear the time-honored green baize apron

The drug store historical exhibit may well begin with a history of the druggist's own store, and his own town Dependent upon the age of the store and the town, abundant material may be found Pictures of the town as it was and as it is Methods of transportation from the day of the ox-cart on to the auto and the aeroplane Old churches, old schools, hospitals, streets and dwelling houses contrasted with the new, including the druggist's own store as it was and as it is To these may be added pictures of old-time citizens, old doctors and their prescriptions, and notable events of the past

Included in a series of exhibits pictures pertaining to the history of medicine might be utilized Here an abundance of material is available

The subjects for an historical display are extensive A few examples may be noted Old-time animal remedies in contrast to modern animal serums Ancient bolus and uncoated pills as against modern pills, capsules and tablets Crude drugs of the past by the side of present-day alkaloids, concentrations and synthetic compounds Charms formerly used as cures in conjunction with to-day's rational remedies

A most creditable display was shown in the *Druggists Circular*, for March 1934, which by means of cards and objects exhibited four thousand years of pharmacy and medicine, beginning with the time of the Egyptians, and concluding with the twentieth century

Another recent exhibit was along the lines of the history of surgery The art of surgery has been completely revolutionized within fifty years While the use of ether is of the nineteenth century, local anesthetics have come into vogue

A show in the history of surgery, which made everybody stop, consisted of the showing of a frock coat, used up to the late nineties as a surgeon's operating uniform, side by side with the outfit of the modern operator's cap, face mask, white gown and rubber gloves

For history to reach into the drug store, it would seem that the beginning should be made in the college of pharmacy A knowledge of the history of the arts to which he is to devote his life should be an inspiration and incentive to the stu-

dent to move forward. Once imbued with this knowledge, he would no doubt carry it to those with whom he may be associated.

In the preparation of this paper, correspondence was had with the deans of some of our colleges of pharmacy as to the place of the history of pharmacy in their colleges. Briefly stated, the situation would be somewhat as follows:

A moderate percentage of the colleges of pharmacy possesses a historical museum, likewise, a collection of data, documents, etc., pertaining to their own institution. A number of the colleges have in their libraries volumes relating to the history of medicine, pharmacy and allied arts. Courses covering the history of pharmacy are given in a goodly number of the colleges. In some of them it is short, covering only two hours in the three or four years' course. However, in some colleges the course is quite extended and complete. Encouragingly, there is reported a moderate interest by students in history as it pertains to pharmacy.

Many of the deans kindly made suggestions as to methods whereby the interest of students and graduates in pharmaceutical history could be increased. These suggestions will be made the subject of a separate paper.

This paper is primarily suggestive. An attempt is made to show that history, especially the history of pharmacy, has not yet reached into the drug store.

That for the great majority of druggists and their clerks, the subject of history has little or no interest,

That while able historical writers have produced much valuable historical data, it has not yet created an historical atmosphere for the rank and file of pharmacists,

That here is an opportunity for our associations to further stimulate interest in historical subjects,

That the practicing pharmacist—the druggist—can, through historical displays, promote an interest in the history of medicine and pharmacy to his own advantage.

HISTORY OF THE CALCIUM LACTOPHOSPHATE PREPARATIONS¹

BY WILLIAM J. HUSA² AND A. P. MCLEAN

Calcium lactophosphate came into use as the result of the suggestion of an European physician, Dr. L. Dusart, who, in 1869, recommended the use of calcium phosphate dissolved in lactic acid (1). In 1871, William Neergaard (2), a pharmacist of New York City, upon the request of Dr. B. W. McCready, prepared a syrup of calcium lactophosphate by dissolving freshly precipitated calcium phosphate in a diluted lactic acid, and adding water, orange flower water and sugar. This is the oldest record we have found of the use of calcium lactophosphate in this country. It was the spark which was followed by a blaze of tremendous popularity.

Because of the demands of physicians for numerous combinations of calcium lactophosphate, preparations other than the syrup came into use. Some of these, such as the elixir, the syrup with iron, and the salt, received official recognition, and there were a number of others, not so recognized, including the solution, the wine, and the emulsion with cod liver oil.

¹ Section on Historical Pharmacy. A. P. H. A., Washington meeting, 1934.

² Head Professor of Pharmacy, University of Florida.

After the article published by Neergaard in 1871, giving a formula for a syrup, a number of somewhat similar reports appeared in other journals. These were written in the main by pharmacists, who suggested their own preferred formulas, or some slight modifications of formulas, which to them seemed to give better or more stable preparations. In the syrup as well as the other preparations the principal difficulty encountered was the formation of a precipitate. Little attention was paid to the cause or nature of the precipitate, but efforts were made to delay or decrease the precipitation by changing the ingredients or varying the amounts. By 1880 the syrup of calcium lactophosphate had come into such wide use that it was recognized in the U S P VI, and was also official in the U S P VII, VIII and IX but was dropped by the U S P X and taken up by the N F V.

The first record found of Emulsion of Calcium Lactophosphate was its recognition by the N F I. It was also official in the N F II, III, IV and V. Syrup of Calcium Lactophosphate and Iron has been similarly recognized by each edition of the N F.

For some years there was a difference of opinion regarding the chemical nature of calcium lactophosphate. Rother (3) considered it to be a double salt while Sambue (4) stated that the salt was merely a mixture of calcium lactate and calcium phosphate. When calcium lactophosphate in the form of the salt was recognized by the N F IV, it was defined as "A mixture in variable proportions of calcium lactate, calcium acid lactate and calcium acid phosphate."

Among the unofficial preparations of calcium lactophosphate, the wine seems to have enjoyed little popularity in comparison with the others, perhaps because the alcohol of the wine made the preparation undesirable for children and it was for children that the preparations were mostly used. The solution of the salt likewise did not find extensive use.

The emulsion of cod liver oil with calcium lactophosphate enjoyed very wide popularity as an unofficial preparation. The earliest formula found was that of W G Moffit (5) published in 1873. Other formulas were proposed and commercial emulsions were put on the market by some of the manufacturers. The emulsion was criticized on pharmaceutical grounds by Polk (6), who also made the following statement:

"The cry of 'Eureka' which has ascended so loudly over the new hobby, lactophosphate of lime and cod liver oil, it seems has almost led the enthusiastic members of the medical profession to hope that the great specific for all the ills to which flesh is heir had at last been found. The long high-sounding name leads us to regard it with respect and confidence. The errors of the combination outside of the quackery into which it has been run, however, immediately concerns us."

The emulsion was popular for about five years and after that no further record could be found in the literature.

Polk's denunciation of emulsion of cod liver oil with calcium lactophosphate appears unjustified in view of later developments. It is now accepted by medical authorities that rickets may be due to a dietary deficiency in any one of three things, *i e*, calcium, phosphorus or vitamin D. The emulsion of cod liver oil with calcium lactophosphate contained all three of these substances needed for proper development of bones, hence it seems unfortunate that the preparation did not remain popular. At the time the emulsion was introduced, vitamins were yet to

remain undreamed of for four decades. The emulsion thus suffered the fate of other innovations which are too far ahead of their time. In passing it is of interest to note that at about the same time that the emulsion fell into disuse, a physician made extensive reports on the value of sunshine in rickets and other diseases but he likewise was too far ahead of this era of irradiated food, irradiated drugs and irradiated human beings.

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS
DEPARTMENT

"The attitude of the American Association of Colleges of Pharmacy on the question of food and drug legislation was well expressed last year when Dean DuMez and the Chairman of the Executive Committee appeared before the Senate Committee considering Senate Bill 2800 and again when the Association met in annual convention and passed a resolution indicating that the Association favored proper food, drug and cosmetic legislation. Our Association has a strategic position because its membership is not financially interested in food, drugs and cosmetics, nor actually involved in the administration of laws governing the distribution of food, drugs and cosmetics and therefore we can take a totally disinterested view of these matters. As citizens we must be vitally interested in the protection of public health and that is especially true in the case of teachers of pharmacy, since we are training young men and young women to go into one of the public health professions. The following statement by President Little of the Association has the approval of the Executive Committee and it sets forth the position we believe the Association should assume."

—C B JORDAN, *Editor*

FOOD AND DRUG LEGISLATION

One of the most important questions claiming the attention of pharmaceutical educators this winter is the problem of a sane, adequate revision of the Pure Food and Drug Act.

The activity of the American Association of Colleges of Pharmacy in helping to promote such a revision needs no justification. We would oppose the idea that the function of colleges of pharmacy is to concern themselves solely with problems of education. That, to be sure, is their major activity, but by no means their sole responsibility. Pharmacy can hope to achieve its maximum accomplishment, only by having all of its various branches stand ready and eager to put their shoulders to the wheel and to play their full part in every possible contact.

It is in this spirit and with this hope that the American Association of Colleges of Pharmacy approaches the problem of food and drug legislation.

One of the most pathetic persons with whom we come in contact is the individual who fails to have definite, concrete opinions concerning important problems which are presented to him in his own or closely related fields. We might place second on this list of pathos, the individual who displays inadequate appreciation and respect for the other fellow's opinion. There is no reason whatsoever why tolerance and definiteness of opinion should not go hand in hand.

Pharmacy has become an exceedingly broad field, with many different interests and activities represented. It is but natural that many of these interests should possess somewhat different ideas as to what constitutes a sane, effective revision of the Pure Food and Drug Act. It is also equally certain that all these various branches of pharmacy have much in common. It is on this common ground that we should marshal and unify our forces and through concerted, efficient action accomplish much in the field of food and drug legislation.

Is not the best procedure to first search out all the various viewpoints and objectives which the different branches of pharmacy have in common? Let none escape us. The greater this pool of common interests, the stronger will be our cohesion and solidarity and hence the greater our accomplishment.

Should the time come, and we sincerely hope that it may not, when certain groups must draw apart to prepare separate bills, let us part with the finest appreciation of the other fellow's viewpoint. Let us part in a spirit of friendship and cordiality, with each group definitely pledged to carry into the product of its individual efforts the very maximum of that which has been commonly agreed upon.

From this point on, those purposes and recommendations which are most meritorious and most completely in accord with public health and welfare should prevail.

If we keep this fundamental objective of public health ever before us as our goal, no really profound differences are likely to develop and a sane, progressive and generally desirable revision of the existing law should not be difficult of attainment.

At the annual meeting of the American Association of Colleges of Pharmacy held at Washington last May, the Association went unanimously on record as favoring Senate Bill No 2800 or a measure of greater merit. That, I believe, represents the attitude of the Association at the present time.

As president of the American Association of Colleges of Pharmacy, I have appointed a special committee, consisting of Dean Andrew G DuMez, Dean Wortley F Rudd and Dean Charles B Jordan, Chairman, to represent the Association as our Committee on Food and Drug Legislation. I have also appointed an auxiliary committee consisting of one or more representatives in each state, to cooperate with the smaller committee as opportunity to do so presents itself. This larger committee will later receive specific directions and suggestions as to ways and means of assisting with our legislative program. In the meantime, we are organized and ready for action.

At a meeting of the National Drug Trade Conference held at Washington, D C, on Wednesday, December 5th, Dean DuMez again set forth the position taken by the American Association of Colleges of Pharmacy with respect to proposed food and drug legislation by a statement of the more important provisions which the Association maintains should be incorporated in any new legislation. These provisions are as follows:

- 1 A new definition of the word "drug" to bring within the purview of the law certain substances (glandular products) and certain devices not always marketed as therapeutic agents in a strict interpretation of the meaning of that term, but which when used as directed, may produce marked alterations in the tissues of the body or the functioning of its organs, as for example devices for increasing stature, devices for developing the bust, devices for stimulating the activity of the prostate gland, nose straighteners, electric belts, etc.

- 2 Provisions for bringing cosmetics within the scope of the law.

- 3 Provisions which will make it obligatory for a manufacturer or distributor who puts up drugs or medicines in packages for sale to the public to state on the label the name, or names of the substance, or substances, upon which the therapeutic or palliative claims for said drugs or medicines are made, and the quantity, or quantities contained in a single dose.

- 4 Provisions for the control of the manufacture, sale and distribution of poisonous habit-forming or deleterious drugs, or medicines containing any of said classes of drugs, to whatever extent is necessary to give the public adequate protection against the harm which may result from the indiscriminate sale of drugs and medicines of this character.

- 5 Provisions for prohibiting the advertisement on the label, package, and/or by any other means of any drug or medicine as a treatment or cure for any of the following diseases: albuminuria, appendicitis, arteriosclerosis, septicemia, cancer, carbuncle, cataract, cholecystitis, diabetes, diphtheria, dropsy, encephalitis, epilepsy, erysipelas, gall stones, heart diseases, high blood pressure, mastoiditis, measles, meningitis, mumps, nephritis, otitis media, paralysis, pneu-

monia, poliomyelitis, prostate gland disorders, pychitis, scarlet fever, sexual impotence, small pox, tuberculosis, tumors, typhoid fever, uremia and venereal diseases

6 Provisions for restricting the advertisement of any drug or medicine, regardless of the medium used for exhibiting or disseminating such advertisement, to the truthful statement of facts with respect to any or all claims made for the palliative or curative properties and/or its value in the treatment of disease

This stand represents the opinion of the Executive Committee of the A A C P and a very high percentage of the individual members of the Association as well

I sincerely hope that our members will actively concern themselves with food and drug legislation during the coming session of Congress and that all controversial questions which may arise will always be settled on a basis of public health and welfare

As long as we keep public health as our platform, the very foundation of all our activities, we cannot seriously err. If we relinquish this guiding motive, we may wander far astray —ERNEST LITTLE, *President*, American Association of Colleges of Pharmacy

GENERAL REGULATIONS, SERIES 4, FEDERAL ALCOHOL CONTROL ADMINISTRATION

A proposed regulation, under consideration by the Federal Alcohol Control Administration, would have placed pharmacists in the class of *dealers in beverage alcohol*, it would have increased the cost of their supply of ethyl alcohol and required them to take out Federal and, perhaps, local licenses, thus adding further costs to the pharmacists' burdens, without giving additional protection to the government service. The points are, the proposed ruling, if it had been adopted, would have increased the cost of alcohol to the pharmacist, because he would have had to buy in gallon bottles paying a higher price and also be subject to the licenses referred to, and be placed in the class of *dealers in beverage alcohol*.

THE AMERICAN PHARMACEUTICAL ASSOCIATION asked the privilege of being heard and expressed that practicing pharmacists should be enabled to freely secure alcohol for medicinal preparations at lowest cost, not only in their own interest but also in the interest of those in need of medicine. This appeal was influential in promoting the regulation to which reference is made and issued January 22 by the Federal Control Administration. Because these regulations are informative relative to general definitions and terms, every pharmacist should secure

copies from the station of the Department nearest to them. Two paragraphs are quoted

"In issuing these Regulations the Administration has provided that alcohol and other distilled spirits in containers of a capacity of one gallon or less shall be deemed to be for non-industrial use. The effect of this provision will be to require all wholesale druggists, industrial alcohol plants and others, who do not hold Federal Alcohol Control Administration permits, to supply the needs of drug stores, hospitals, pharmaceutical manufacturers and other industrial alcohol users in containers having a capacity of more than one gallon."

'Heretofore the Regulations of the Treasury Department which require that beverage distilled spirits for sale at retail be placed in glass liquor bottles, have not been applicable to alcohol. The Treasury Department, however, acting in cooperation with the Administration and desiring that all spirits for beverage use be definitely distinguishable from spirits intended for industrial purposes, is amending its Bottle Regulations so as to require that on and after April 15, 1935, all distilled spirits, including alcohol, if marketed in containers of a capacity of one gallon or less, shall be placed in glass liquor bottles manufactured under Treasury permit and having blown therein the indicia required by Treasury regulations."

THE AMERICAN PHARMACEUTICAL ASSOCIATION always seeks to be of service to pharmacy and pharmacists

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1934-1935

Office of the Secretary 2215 Constitution Avenue, Washington, D C

LETTER NO 9

December 20, 1934

To the Members of the Council

48 *Minutes of the Meeting of the Executive Committee* Motion No 2 (Council Letter No 2, page 846) has been carried President Fischelis requests that he be recorded as voting 'No' on this motion

49 *Committee on the Proposed Council on Pharmaceutical Practice* Chairman Cook has submitted the following report for this Committee with the statement that the report has the endorsement of all members of the Committee who were present at the meeting on August 18th Chairman Cook expressed the belief that although the actual carrying out of the plan will be dependent upon some scheme of finance which it is hoped can be developed, it will be an advantage to have the plan presented in full and discussed so that it can be better understood

REPORT TO THE AMERICAN PHARMACEUTICAL COUNCIL ON THE SUGGESTION TO ESTABLISH "A NATIONAL COUNCIL ON PHARMACEUTICAL PRACTICE" AS AN ACTIVITY OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The proposal was presented at the Second General Session of the AMERICAN PHARMACEUTICAL ASSOCIATION at its 1934 meeting (see the JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION, 1934, page 601) and was also brought before the Council and referred to a special Committee with a recommendation for action

Considerable correspondence ensued and a meeting of the Committee was called in Washington for August 18 1934 The following were present Messrs Army, Cook, Fischelis, Jordan, Kelly Spease and Swain Messrs Gaw and Gathercoal were unable to be present although Professor Gathercoal sent a communication outlining his views

The discussion was general and included many of the problems which enter into to day's pharmaceutical practice in this Country

It was believed especially important to avoid creating an impression that the AMERICAN PHARMACEUTICAL ASSOCIATION was discriminating between pharmacists, since its sole object was to uplift every branch of pharmacy

Every practicing pharmacist would be invited to participate and while not all would care to do so, the reasonable and proper specifications intended should permit any properly trained and equipped pharmacist to register

The following recommendations were approved for the consideration of the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION

1 That there be recommended to the Council the establishment of a "Council on Pharmaceutical Practice" to be conducted under the auspices of the AMERICAN PHARMACEUTICAL ASSOCIATION

2 In the recommendation to the AMERICAN PHARMACEUTICAL ASSOCIATION Council it is to be indicated that the objects of this group are to promote improvement in pharmaceutical practice by the following activities

(a) The assembling of information and facts from all available sources concerning the efficient practice of Pharmacy in

(1) Retail Pharmacies

(2) Pharmacies in hospitals and institutions

(3) Pharmacies in Government Service

(b) The dissemination of this information to those responsible for the conduct of pharmaceutical service in these fields

(c) To offer every facility of the AMERICAN PHARMACEUTICAL ASSOCIATION in the promotion of such service

(d) To establish minimum standards for pharmaceutical practice in these three fields

It was further moved and the motion approved unanimously, that it be recommended to the AMERICAN PHARMACEUTICAL ASSOCIATION Council that "if the AMERICAN PHARMACEUTICAL ASSOCIATION Council approves of the establishment of a Council on Pharmaceutical Practice and its objectives, that it be further recommended that this Committee be continued for the purpose of developing the plan and presenting a more perfected program to be reported to the AMERICAN PHARMACEUTICAL Council at the Portland Meeting in 1935 "

The personnel of the proposed "Council on Pharmaceutical Practice" was also discussed and it was recommended that the Council should consist of the Chairman of the National Formulary Committee of Revision, the Chairman of the U S Pharmacopoeial Committee of Revision a representative of the American Association of Colleges of Pharmacy, a representative of the National Association of Boards of Pharmacy, a pharmacist in retail service, a hospital pharmacist and a Government pharmacist, the President of the AMERICAN PHARMACEUTICAL ASSOCIATION Ex-officio and the Secretary of the AMERICAN PHARMACEUTICAL ASSOCIATION Ex Officio—making a total of nine members

It was also recommended that one representative from each of the following organizations be invited to participate in the work of the Council in an advisory capacity but without a vote

The National Association of Retail Druggists
 The American Drug Manufacturer's Association
 The American Medical Association
 The American College of Surgeons
 The American College of Physicians
 The American Dental Association
 American Nurses Association
 The American Hospital Association
 The Food and Drug Administration
 The Surgeon General of the Public Health Service
 The Surgeon General of the Army
 (Medical Administrative Corps)
 The Surgeon General of the Navy
 (Hospital Corps)

All of which is respectfully submitted with the request that the proposals be promptly considered by the Council

E FULLERTON COOK, *Chairman*

In this connection, the following letter has been received from President Fischelis
To the Members of the Council

I am glad to join Professor Cook in advocating the adoption of the suggestion to establish "A National Council on Pharmaceutical Practice" as an activity of the AMERICAN PHARMACEUTICAL ASSOCIATION. As I see the proposal it entails a survey of existing pharmaceutical practice and the formulation of minimum standards to which pharmacies desiring the approval of the Council must adhere.

The AMERICAN PHARMACEUTICAL ASSOCIATION is already committed to a survey of pharmaceutical practice by resolutions adopted at recent conventions.

It is my belief that the establishment of "A Council on Pharmaceutical Practice" within the AMERICAN PHARMACEUTICAL ASSOCIATION organization is a forward step which will be welcomed not only by the profession of Pharmacy, but also by the medical profession and the public.

If the objectives of this Council are properly publicized, it should be possible to obtain financial support for its organization. In my judgment this proposal should be made one of the main objectives in the campaign for funds to carry on a wider scope of activities at our Washington Headquarters.

(Motion No 16) *It is moved by Eberle that the report of the Special Committee on the Proposed Council on Pharmaceutical Practice be received and that the recommendation that the Special Committee be continued for the purpose of developing the plan and presenting a more perfected program to be reported to the Council at the Portland meeting in 1935, be approved* Comments are invited

E F KELLY, Secretary

LETTER NO 10

December 28, 1934

To the Members of the Council

50 *Contract for Printing and Mailing the JOURNAL OF THE A P H A for 1935* The following recommendation has been submitted by Chairman DuMez of the Committee on Publications

"I have carefully gone over the bids on the publication of the JOURNAL for next year, received by Dr Eberle, and find the present publishers, namely, the Mack Printing Company, of Easton, Pa., to be the lowest bidders. This Company will also give us the best price on reprints. I, therefore, recommend to the Council that unless Editor Eberle has some good reason for making a change, the contract for publishing the JOURNAL for the ensuing year be awarded to the Mack Printing Company, of Easton, Pa."

Editor Eberle concurs in the recommendation

For the information of the members of the Council, it is stated that the contract provides for the insertion in each issue of the JOURNAL of forms of sixteen pages, or multiples of pharmaceutical abstracts, with separate paging and indexing, as recommended by the Special Committee on YEAR BOOK (see September 1933, issue, JOURNAL, A P H A, pages 914-916). It is the intention of the Editor of the YEAR BOOK to start the insertion of the abstracts for 1935 in the March issue and to issue the Report of the Progress of Pharmacy for 1934 in the usual form.

(Motion No 17) *It is moved by DuMez that the contract for printing and mailing the JOURNAL for 1935 be awarded to the Mack Printing Company of Easton, Penna.* At the request of Chairman DuMez a vote is called for at this time but will be considered as tentative if there is objection. A voting card is enclosed.

51 *Budget for 1935* Chairman Philip of the Committee on Finance submits, in accordance with Article II of Chapter II of the By-Laws of the Council, the following report on appropriations and expenditures for 1934, with a suggested budget of receipts and appropriations for 1935 which were prepared by the secretary and approved by the chairman of the Finance Committee. The officers and Finance Committee are fully aware of the difficult times we are going through which have resulted in reduced receipts, and several items in the proposed budget have been again reduced, while others must be increased, the total being two thousand dollars more than for 1934 due largely to the increase in the appropriation for maintenance of the Building.

"To the appropriation for General Expenses in 1934 two additions were made—fifty dollars for the Section on Practical Pharmacy and Dispensing and two hundred dollars for the American Council on Pharmaceutical Education. Of the appropriations two have been exceeded to December first. The disbursements for maintaining the Headquarters Building were \$2929.92 against \$1800.00 and the disbursements for the Scientific Section were \$29.97 against \$25.00. The latter is within the \$50.00 limit for which Council action is not required. In submitting the budget for 1934 it was stated that the expenses of maintaining the Building could not be estimated, and when the expenses for the year are known, a motion to increase the appropriation will be submitted. The expenses of the Committee on the Proposed Council on Pharmaceutical Practice were contributed through Chairman Cook. Charges to December 1st for General Expenses were \$14,947.52 against \$21,380.00 appropriated. Every effort has been made to keep the expenses below the budget appropriations.

"Under the appropriations for open accounts to December 1st, the JOURNAL charges were \$7371.58 against the \$11,000.00 appropriated, the N F \$3092.98 against the \$1000.00, and the Recipe Book \$665.85 against the \$500.00. No charges were made against the appropriation for

\$50 00 for Badges and Bars Charges to December 1st were \$11,130 41 against the \$12,550 00 appropriated

"To December 1st the total budget charges were \$26,077 93 against appropriations of \$33,680 00 for the year, so we will not exceed our total budget

"The receipts to December 1st show considerable variation from the estimates From Dues, \$7309 84 as compared to \$7727 38 for the same period in 1933 Every effort has been made to hold this figure up, but many explain that they cannot afford the expense Bills for dues for 1935 were mailed on December 1st and we cannot say what the total for the year will be From the JOURNAL, \$8529 85 as against \$7271 15, which is very satisfactory under present conditions From the N F \$4712 36 for the year as against the estimate of \$3500 00, which is very encouraging From the Recipe Book, \$1417 78 for the year against the estimate of \$1000 00, which shows a decided gain \$2000 00 has been billed to the U S P Board of Trustees for the YEAR BOOK, Volumes 20 and 21, and sales were \$45 68 to December 1st

"It has been necessary to use the income from the Life Membership Fund for the year and to transfer \$1000 00 of accumulated interest to the Current Fund "

BUDGET FOR 1935

It is very difficult to estimate receipts under present conditions As the receipts from the sales of the National Formulary and of the Recipe Book are always approximate, the estimates for 1935 are based on the receipts for 1934 The following is suggested

Interest	\$ 100 00	
Dues	12,500 00	
Interest Life Membership Fund	5 500 00	
JOURNAL	9,500 00	
National Formulary	4,500 00	
Recipe Book	1,500 00	
YEAR BOOK	2,200 00	\$35 800 00

APPROPRIATIONS FOR GENERAL EXPENSES

No 1	Salaries	\$11,700 00
No 2	Maintenance of Building	3 500 00
No 3	Telegraph and Telephone	200 00
No 4	Clerical Expenses	1,200 00
No 5	Printing Postage and Stationery	700 00
No 6	Office Supplies	150 00
No 7	Traveling Expenses	500 00
No 8	Premium on Bonds	50 00
No 9	Auditing	75 00
No 10	Certificates	50 00
No 11	Miscellaneous	200 00
No 12	Scientific Section	25 00
No 13	Section on Education and Legislation	25 00
No 14	Section on Practical Pharmacy and Dispensing	25 00
No 15	Section on Commercial Interests	25 00
No 16	Section on Historical Pharmacy	25 00
No 17	Commission on Proprietary Medicine	25 00
No 18	Committee on Local Branches	25 00
No 19	Committee on Membership	250 00
No 20	Committee on State and National Legislation	50 00
No 21	Committee on Syllabus	50 00
No 22	Committee on Pharmacy Week	250 00
No 23	Inter-Society Color Council	25 00
No 24	International Pharmaceutical Federation	120 00

No 25	Metrie Association	10 00	
No 26	American Conference on Hospital Service	25 00	
No 27	American Council on Pharmaceutical Education	200 00	
No 28	YEAR BOOK	3,500 00	
No 29	Library	50 00	\$23,030 00

APPROPRIATIONS FOR OPEN ACCOUNTS

No 30	JOURNAL		
	(a) Publication	\$9,500 00	
	(b) Electrical Expenses	1,000 00	
	(c) Postage and Stationery	300 00	
	(d) Freight, Drayage and Miscellaneous	200 00	\$11,000 00
No 31	National Formulary	1,000 00	
No 32	Recipe Book	500 00	
No 33	Badges and Bars	50 00	\$12,550 00
			<u>\$35 580 00</u>

' It will be necessary to curtail expenses wherever possible, to keep the JOURNAL within the appropriation which will mean abstracting or condensing many papers and articles, and to advance the extra charges for the completion of the revision of the N I and the Recipe Book. When the Budget for 1934 was submitted, it was stated that the cost of maintaining the Headquarters Building could not be accurately estimated. The expenses for maintenance for the year have amounted to approximately \$3200 00 and, with this experience, it is believed that the \$3500 00 included in the budget for 1935 will be sufficient "

(Motion No 18) *It is moved by Philip that the Budget for 1935 be approved as submitted* With the approval of the Chairman of the Council, a vote is called for at this time. It will be considered as tentative if there is objection.

52 *Selection of Auditors* The Chairman of the Committee on Finance recommends the employment of W A Johnson & Co, Baltimore, Md, to audit the accounts of the ASSOCIATION for 1934, in accordance with Article 8 of Chapter IV of the By-Laws. This Company has audited the accounts since 1922. The appropriation for the audit has been \$75 00 for each year.

(Motion No 19) *It is moved by Philip that W A Johnson & Co be employed to audit the accounts of the ASSOCIATION for 1934*

53 *Applicants for Membership* The following applications properly endorsed and accompanied by the first year's dues have been received:

No 77, Thomas W McKelvey, 3123 Union St, Bellare, Ohio, No 78, Yeznig P Balouny American University, Beirut, Syria, No 79, Aram K Ojalian, American University, Beirut, Syria, No 80, Frank J Zuck, 201 Rockford National Bank Bldg, Rockford, Ill, No 81, Julius Meyenberg, 114 Main St, LaGrange, Texas, No 82, Leroy P Baker, 1615 N W 27th Ave, Portland, Oregon, No 83, Richard H Waterman, 613 Orpington Rd, Catonsville, Md, No 84, James Herzog, 3168 Main St, Buffalo, N Y, No 85, Augustus C Taylor, 1733 Upshur St, Washington, D C, No 86, Donald G Sellner, 3015 Huntington Ave, Omaha, Nebr, No 87, John J Goodyear, 2049 Meridian St, Indianapolis, Ind, No 88, Roy A Perry, 1239 S W Jefferson, Portland, Oregon, No 89, Thomas Schratz, 208 Lincoln Ave, Pittsburgh, Penna, No 90, William F Siegel, 241 West Fifth St, Erie, Penna, No 91, Philip R Marsh, 331 Second St, Aspinwall, Penna, No 92, Dale W Yontz, Fifth St, Newell, W Va, No 93, Bernard F Stairs, 426 Main St, Mt Pleasant, Penna, No 94, Rosella Lois Corsello, 3712 Brighton Rd, Pittsburgh, Penna, No 95, Albert J Gabig Jr, 319 Reamer Ave, Carnegie, Pa, No 96, Inez W Henderson, 410 1/2 N Third St, Jeannette, Penna, No 97, Irene Klein, Presto, Penna, No 98, A R Beamon, 157 W 61st St, Los Angeles, Calif, No 99, Chieko Otsuki, 70 S W Salmon St, Portland, Oregon, No 100, Victor R Taylor, 1644 S E 40th Ave, Portland, Oregon, No 101, Edward Meyer, College Station, Pullman, Wash, No 102, Harold C Freed

TESTIMONIAL DINNER TO R P FISCHELIS, PRESIDENT OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, HOTEL PENNSYLVANIA

The Testimonial Dinner on January 10th, tendered to President R P Fischelis, by the New York Branch of the A Ph A , was largely attended by members and visitors. The program of the function was well arranged and carried out under the direction of Chairman Hugo H Schaefer, assisted by the Dinner Committee. The participants included members from New York and New Jersey, others came from Philadelphia, Washington and other cities.

Dr C W Ballard, president of the New York Branch of the A Ph A , presided as Toastmaster. On the dais were seated the honored guests, President and Mrs Fischelis, Dr and Mrs H V Army, Dr and Mrs C W Ballard, Dr and Mrs Charles Elliott, Charles J McClosky, Dr A C Morgan.

Toastmaster C W Ballard, president of the New York Branch, A Ph A , after making introductory remarks, called on Dr A C Morgan, emeritus professor of Clinical Medicine of Temple University, who reviewed the professional activities of the honored guest.

Charles H Elliott, Commissioner on Education of the State of New Jersey, was next introduced, he spoke of the activities of the guest of honor in educational matters.

Charles J McClosky, former president of New Jersey Pharmaceutical Association referred to the activities of Dr Fischelis in association and board of pharmacy matters. He was followed by former president of the A Ph A , Dr H V Army, who spoke of associated activities and gave his address a personal touch.

The honored guest in his address discussed the activities of the AMERICAN PHARMACEUTICAL ASSOCIATION and presented his plans for greater coordination of its divisions and for larger membership.

President Fischelis was presented with a certificate of Life Membership in the AMERICAN PHARMACEUTICAL ASSOCIATION, by the New York Branch and Mrs Fischelis with a beautiful bouquet. New Jersey Pharmaceutical Association presented Dr Fischelis with a gavel of an historical source.

Guests at the Testimonial Dinner, honoring Dr R P Fischelis, President of the AMERICAN PHARMACEUTICAL ASSOCIATION, by New York Branch A Ph A January 10, 1935

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council "

—Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association "

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates "

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

BALTIMORE

The regular monthly meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Hotel Emerson, Friday, December 21, 1934 The meeting was called to order by President B Olive Cole who introduced the speakers of the evening

The first speaker, Wm B Baker, of the School of Pharmacy, University of Maryland discussed his recent work on the standardization of aconite preparations Mr Baker pointed out in the course of his address that the conflicting reports of early investigators on the value of aconite as a therapeutic agent are believed due primarily to the fact that the drug and its preparations decrease rapidly in potency The instability of the drug and its preparations is believed to be caused by the decomposition of the active principle aconitine

Experimental studies were made with the object in view of determining the rate of deterioration of aconite preparations, and of determining which of the stabilizers in use are the most efficient Incidentally, the accuracy of the U S P X method of assay was also studied It was concluded that the use of hydrochloric acid as a stabilizer for tincture of aconite is superior to acetic and hypophosphorous acid as stabilizers provided the preparations are adjusted to the correct hydrogen-ion concentration (p_H 2.3-3.0), that aconite in the form of the whole drug deteriorates rapidly and the powdered drug even more so, that the resistance of guinea pigs to aconitine is consistent, provided the weight range specified by the U S P X is strictly adhered to, and further provided that these guinea pigs are in absolutely healthy, normal condition, and that the advisability of the use of aconitine as a bio assay standard should receive more extensive consideration

The second speaker Wm H Hunt, of the School of Pharmacy, University of Maryland, discussed the bio assay of strophanthus preparations The therapeutic classification of the drug was given and this was followed by a discussion of the chemistry of strophanthus It was pointed out that a considerable amount of criticism has been directed at the various bio-assay methods of strophanthus preparations After careful investigation it was pointed out that the modified Hatcher-Brody cat method, the Trevan mortality curve frog method as modified by Chapman and Morrell, and the U S P X one hour frog method, all had been found to yield results which agreed within the limits of experimental error Mr Hunt further stated that the Knudson and Dreshach chemical method of assay was observed to yield inconsistent results which were rarely in agreement with the results obtained by the physiological methods

The last speaker Harry Rosen, also of the School of Pharmacy University of Maryland, selected as his topic, "Pyrethrum " Among other interesting things about pyrethrum discussed by Mr Rosen the following was especially interesting It was pointed out that reference to another pyrethrum, *anacyclus pyrethrum*, or pellitory occurs in the literature and one should always indicate the particular pyrethrum intended The pyrethrum known as insect flowers was

the topic of discussion. The historical and commercial aspects of pyrethrum were presented. In reviewing the chemistry of the subject it was pointed out that some volatile substance other than the pyrethrins which possess toxic activity occurs in the drug. The difference in toxicity of the drug to warm and cold blooded animals was pointed out. Finally, the various chemical and physiological methods of assay were discussed.

The papers were discussed by Drs. A. G. DuMez, R. S. Fuqua, M. R. Thompson, John Glassford, J. C. Baucr, and others present.

A rising vote of thanks was tendered to the speakers for their interesting papers.

Before adjournment, President Cole appointed the Nominating Committee for the year 1934. This committee, it was pointed out, is expected to report at the January meeting in 1935.

The committee consists of the following: *Chairman*, Aquilla Jackson, *Mrs. Grace Lotz* Kahler and Simon Solomon. *C. JELLEFF CARR, Secretary*

JANUARY

The first meeting in 1935 of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Hotel Emerson, Friday, January 11th, President B. Olive Cole was in the chair.

The president reported on the activities of the Branch during 1934 and pointed out the general success of the organization for the year. The secretary-treasurer reported that the average attendance for the six meetings in 1934 was fifty members. The total membership now standing at 170. Particular attention was called to the new student membership in the AMERICAN PHARMACEUTICAL ASSOCIATION presented by the Branch annually to some student selected by the Faculty of the School of Pharmacy, University of Maryland.

The minutes of the December meeting were read by the secretary-treasurer and approved.

The report of the Committee on Membership was read by Chairman Gilbert Joseph. It was moved by C. Jelleff Carr that the report be accepted—carried.

The report of the Committee on Professional Relations was given by Chairman Simon Solomon, who pointed out the activities of Marvin J. Andrews in his U. S. P. and N. F. publicity work in Maryland and expressed the opinion that this was of great benefit in bringing about better professional relations between the physician and the pharmacist. In addition he mentioned the possibility of pharmacists conducting clinical laboratories or engaging in more professional types of activities. The report was discussed by Dr. A. G. DuMez who pointed out the opposition which the American Medical Association feels toward clinical laboratories conducted as accessories to retail pharmacies. He expressed his inability to understand why pharmacy students upon graduation go into purely commercial enterprises. Dr. DuMez stated that, in his opinion, the consolidation of the forces of pharmacy was necessary and that a decided effort should be put forth by pharmacists to bring about such a consolidation. Dr. John C. Krantz, Jr., stated in discussing the problem, that the over-production of pharmacists by the schools of pharmacy was of paramount importance in producing many of our problems. It was moved by Wm. F. Reindollar that the report of the Committee be accepted—carried.

The report of the Committee on Education and Legislation was presented by Dr. A. G. DuMez. The work of the National Association of Boards of Pharmacy and American Association of Colleges of Pharmacy was mentioned. The status of the new food and drugs bill introduced into the new Congress by Senator Copeland known as S. 5 was discussed. Dr. DuMez expressed the belief that some satisfactory bill would eventually be evolved whereby the old Food and Drugs act of 1906 could be amended to the satisfaction of all agencies concerned. It was moved by Wm. F. Reindollar that the report be accepted. The motion was seconded and carried.

The report of the Committee on Science and Practice of Pharmacy was presented by Chairman R. S. Fuqua, the report was comprehensive and exceedingly interesting. It was moved by Wm. F. Reindollar that the report of this committee be accepted with thanks and the committee discharged—carried.

The report of the Nominating Committee was given by Simon Solomon. After discussion the following were nominated for offices for 1935: *President*, Wm. F. Reindollar, *Vice President*, A. N. Hewing, *Secretary-Treasurer*, C. Jelleff Carr. The secretary was instructed to cast the ballot in accordance with the wishes of the Nominating Committee.

After installation of the officers President Reindollar appointed the following committee chairmen *Membership*, Gilbert Joseph, *Professional Relations*, Marvin J Andrews, *Science and Practice of Pharmacy* Dr J C Krantz, Jr, *Education and Legislation* Dr J C Bauer

C JILLEFF CARR

CHICAGO

The monthly meeting of the Chicago Branch, AMERICAN PHARMACEUTICAL ASSOCIATION, was held on Tuesday, December 18th, at the University of Illinois College of Pharmacy

As this was the close of the year for the Branch the secretary-treasurer, L Templeton, read a report of the financial condition of the Branch This was followed by a report of the committee on nominations for officers for the coming year The nominations were unanimously accepted by the members present They are *President*, G L Webster, *First Vice President*, S W Morrison, *Second Vice President* R A G Linke, *Thrd Vice-President*, H M Emig, *Secretary-Treasurer*, L Templeton, *Delegate to the House of Delegates*, L Templeton, *Committee Chairmen* *Membership*, Thomas F Rylands, *Legislation*, J Riemenschneider, *Practice*, I A Becker, *Medical Relations*, D Bernard Fantus, *Publicity*, A E Ormes

A motion was passed to appoint a committee to draft a resolution against the repeal of the local Arvey ordinance, the repeal of which would prevent the medical schools of the city from using the impounded and unclaimed dogs for research and scientific purposes

The speaker of the evening was O C Durham of the Abbott Laboratories He discussed 'Allergy from the Standpoint of the Manufacturer and Pharmacist' The following is a brief summary of the discussion

The field of allergy is comparatively new Only a few years back the Medical Schools were not giving training in this now important subject

The word "allergy" was coined to mean an over-sensitiveness of the body to some particular thing About ten per cent of the people are affected by some ordinary thing that does not affect the average person

People only recognized the afflictions of allergism less than 100 years ago An English doctor afflicted by pollens began an investigation He made collections of pollens, collections of air samples, laboratory tests, skin tests and extractions, this was about 1870

In 1903, a German doctor made serums by injecting the pollens into horses His attention was called to the fact that the horses, by their nature of eating, probably already were inoculated with the pollens The serums obtained were not a success

As late as 1906 most doctors did not think that pollens caused allergisms The idea prevailed that there was not enough pollen in the air to cause a reaction Proof now shows that the per cent of pollen needed to give reactions is very small The treatment now is to inject the pollen in small doses, gradually increasing the doses so that the patient becomes accustomed to the pollen The sufferers should either take these treatments or stay away from the source of the disturbance

Dextrose and water are most commonly used as the vehicle for pollen injection

There are geographical calendar and individual complications in pollen reactions The pollens are caught on glass plates and are easily identified This gives a clue as to what pollens are in the air and narrows down the possibilities of the ones causing the trouble Slides were shown that gave much information as to pollen production, collection, methods of transmission and extraction

The standard treatment is to give sixteen doses with increasing strengths The injections are made hypodermically just below the outer skin Skin reactions are the clue to the offending pollen Many pollens belong to the same botanical group, hence the patient may be sensitive to all these but should be immunized only against those pollens of the group that are in the particular locality

Mention was made of allergisms toward many things that we eat, such as rice, tomatoes and cabbage It was emphasized that all is not known about allergism, why particular substances cause a disturbance with some people and not with others, the exact chemical nature of the substances, or how they act on the tissues of the body However sufficient progress has been made so that day extracts are made of the offending pollens and in most cases give relief to sufferers

L TEMPLETON, *Secretary-Treasurer*

NEW YORK

The December meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held in the Brooklyn College of Pharmacy, Long Island University, on the evening of December 10, 1934. About ninety members and their guests attended.

As the meeting was called to order, President Ballard expressed the thanks of the New York Branch to the Kings County Pharmaceutical Society for their kind invitation to hold the December meeting in the Brooklyn College of Pharmacy. The report of the secretary was then read and accepted.

Chairman Lehman, of the Committee on Education and Legislation now reported as follows:

A bill is expected to be introduced in the next Congress, instituting Unemployment Insurance, the cost of which is to be met by a 4% tax on pay rolls. Whether the employer or the employee is to pay the tax, has not been decided as yet.

Owing to the defeat of Congressman Clyde Kelly of Pennsylvania, a valuable ally is lost to the sponsors of price stabilization. It is hoped, however, that another strong member of the House of Representatives will take up the burden of introducing another Capper-Kelly bill.

A bill amending the Pure Food and Drugs law will be offered at the next session of Congress. Senator Copeland is preparing an amended Tugwell Bill which he hopes will meet all objections. This was announced by Secretary of Agriculture Wallace on November 24th. An admirable draft of an amended pure food and drugs law was published by W. Bruce Philip, former Washington representative of the N. A. R. D., which could be adopted in its entirety, and fill all requirements.

The NRA has approved the amendment to the Retail Drug Code making the payment of assessments mandatory. The budget is still under consideration, however.

Violators of Code Laws have been found guilty by the courts in New York and Virginia. In New York the violator was guilty of substitution and the one in Virginia violated the minimum price provision.

The committee on legislation of the New York State Pharmaceutical Association intends to introduce several bills in this session of the Legislature, among them one preventing the sale of prophylactic remedies and appliances (for the purpose of preventing venereal infection) by anyone except a registered pharmacist, another, a price stabilization bill similar to the California Law (Little of Junior Capper-Kelly Bill) and also several important amendments to the pharmacy laws.

Mayor La Guardia signed the 2% sales tax law which went into effect December 10th. Sales are taxed on all merchandise except foods, beer, physicians' prescriptions and newspapers. The tax is to be paid by the purchaser in the following manner: All sales of 12¢ or under are free of tax, all sales from 13¢ to 62¢, inclusive, 1¢ tax, all sales from 63¢ to \$1.00, inclusive, 2¢ tax, 1¢ tax on every 50¢ or fraction thereof, when the amount of sale is more than \$1.00.

Regarding the Bronx Drug Clerks Strike, Judge Frankenthaler denied the demand for an injunction against picketing, which was to be foreseen in the present attitude against interference with peaceful picketing. The matter will have to be argued in court.

Dr. Ballard thanked Chairman Lehman for his report and called upon Auditor Bilhuber, for a report. He announced that he had examined the accounts of the Branch and had found everything in perfect order.

Chairman Dauer, of the Committee on Progress of Pharmacy, then reported on several new proprietary preparations, among them: Tuberculin, P. P. D., Theelin in Oil, Ergone (Sensibamin), Larostudin, Gastric-Mucin and others.

President Ballard then announced the appointment of the following members on the Nominating Committee to report at the next meeting: Chairman, R. S. Lehman, E. A. Bilhuber and L. N. Brown.

The business part of the meeting being over, the chairman introduced the first guest speaker of the evening, Dr. Frederick Schroeder, who discussed "Modern Medicine in Relation to Prescription Writing."

Dr. Schroeder briefly reviewed some of the good work done in prescription writing propaganda last winter; he expressed the opinion that the plan of approach was, however, not entirely satisfactory, and that results were not sufficient for the time and effort spent.

In conducting the propaganda campaign the following program was followed

- 1 Lecturers were sent to hospitals to discuss prescription writing with internes
- 2 Formularies were mailed monthly to physicians
- 3 The failure of medical schools to teach therapeutics was criticized and efforts were made to reinstate the course
- 4 The exhibit of U S P and N I products provided by Dr Lascoff was frequently used
- 5 Physicians were urged not to write for proprietary products, particularly where a similar product was official

In all this, nevertheless, one important point was ignored, Dr Schroeder maintained and this was the subject he wished to discuss

In introducing his idea, the speaker began by pointing out that therapeutics is a modern branch of medicine. The slow and late development of therapeutics was due to the fact that it is founded on a thorough knowledge of physiology, pathology and pharmacology. It has only been in recent times that great advances were made in these branches. Furthermore, the study of therapeutics was long hampered by a school of therapeutic nihilism.

In the second half of the nineteenth century real progress began with the study of the effects of drugs on animals. The profound effects of organic chemicals were soon discovered and anesthetics and disinfectants came into use. Systematic research was instituted, biochemistry became a science and provided a knowledge of vitamins and endocrines. Endocrine therapy began in 1891 with the administration of thyroid, in 1921, Insulin came into use for diabetes and now we have a remedy for pernicious anaemia—Liver.

Progress in chemo therapeutics and in the development of biological products is progressing rapidly, and new and far more satisfactory remedies have been found for many of the ailments to which man is heir.

The results of all of this have produced the following

- 1 Preparation of medicines goes from pharmacist to manufacturer
- 2 The choice of remedy becomes difficult for the physician, because of intensive advertising
- 3 New standards of value are necessary in comparing these new products

In summing up, Dr Schroeder showed that years ago, for many diseases and ailments numerous prescriptions were written, to day, specific biologicals are available, new chemo therapeutic agents, or proper diet rules are followed. Systematic treatment has replaced symptomatic. All this progress in therapeutics has contributed very largely to a reduction in prescription writing. Dr Schroeder suggested that the pharmacist keep himself thoroughly acquainted with these new advances, he should go back to an all drug pharmacy, and should direct his efforts to encouraging prescription writing among veterinarians who still use "old therapy."

Following Dr Schroeder, the chairman introduced Dr Jacob Sarnoff who spoke on the "Romance of Surgery."

Unfortunately it is impossible to give, in writing, a satisfactory report of Dr Sarnoff's presentations since most of his material consisted of special moving picture films showing surgical operations in progress. The pictures were greatly admired by every one and the comments made by Dr Sarnoff made the presentation intensely interesting.

In connection with Dr Schroeder's address Dr Sarnoff pointed out that modern surgery was also largely responsible for a reduction in prescription writing.

At the close of Dr Sarnoff's address a rising vote of thanks was accorded both speakers.

RUDOLF O HAUCK Secretary

NORTHERN OHIO

The monthly meeting of the Northern Ohio Branch was held on November 9, 1934, at the Faculty Club of Western Reserve University.

This meeting was given over to discussion of the report of a committee appointed for the purpose of formulating a set of principles of cooperation between the Cleveland Academy of Medicine and the Cleveland Academy of Pharmacy.

The committee reported that in conjunction with a similar committee representing the Academy of Medicine it had adopted an expression of thought in printed form, which will enable

both practicing physician and pharmacist to cooperate with one another for the good of the patient. This expression of thought was approved and a copy of the resolution ordered forwarded to all members on the rosters of the Academies of Medicine and Pharmacy in Cleveland. It reads as follows:

A The welfare of the public requires a close cooperation between an intelligent well-trained medical profession and a pharmaceutical profession equally intelligent and equally well trained in its special field.

B Personal contact between the physician and the pharmacist is essential in securing and maintaining this cooperation.

C The relationship between these two groups is not stationary but will require a continuous modification and elaboration of concepts and principles with changing conditions.

CONCEPTS

Following are the concepts upon which the above principles are based:

- 1 The public is entitled to the best possible medical care.
- 2 Such medical care postulates not alone competent doctors but accurate and ethical pharmaceutical service.
- 3 The natural corollary is that these two are mutually interdependent.
- 4 The mutual understanding of the codes of conduct of the two groups obviously will facilitate the service each can render to the other.
- 5 The establishment of an understanding acquaintance between the pharmacist and the physician who practices in his district is essential for intelligent cooperation.
- 6 The maintenance of this understanding once established depends upon the ability of the pharmacist to meet his obligation as a scientifically trained person.
- 7 This understanding acquaintance is based upon personal contact not only in the pharmacy but in the office of the physician as well.
- 8 Under these circumstances the discussion of mutual problems is facilitated and the obligation of the pharmacist to make available to the doctor information of the progress of pharmacy can be best met.
- 9 Furthermore the public is entitled to the best and most accurate professional pharmaceutical service at the lowest cost consistent with a reasonable profit to the pharmacist for this service.
- 10 Such a service cannot be furnished to the public through the use of proprietary medicines of known or unknown formulas since they are not designed for this purpose.
- 11 The use of proprietaries by doctors, either by prescriptions, sample or word of mouth, tends to favor self-medication with its attendant dangers to the patient.
- 12 It is the obligation of the medical men to be familiar with the action of drugs and prescription writing so that he will not have to take advantage of formulas suggested by proprietary medicine manufacturers or by their detail men.
- 13 The pharmacist by virtue of the accuracy of his information should supplant the detail men.
- 14 The discussion of details of the mechanics of pharmacy will naturally follow the establishment of this cooperation between physician and pharmacist.

By mechanics we mean counter prescribing, office dispensing, methods of handling prescribed proprietaries, cost of extra services aside from cost of materials and true pharmaceutical service and similar details affecting the working relationship between physician and pharmacist.

The ninth meeting of the Northern Ohio Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION for the year 1934 was held at the Faculty Club of Western Reserve University, Cleveland, Friday evening, December 14th.

A resolution was passed directing the secretary to formulate certain by-laws that may be adopted later by the Branch in order that more definite standards of practice may be promulgated in relation to the public and, especially, to the medical profession. The most controversial factors involved are:

- (a) Type of window displays.
- (b) Relative prominence of professional and non-professional items of merchandise on counter displays.

(c) Itemized list of minimum equipment in the prescription department

(d) Minimum list of reference books in library

The following officers for 1935 were elected

President, Harry E. Speer, *Vice-President*, Ellsworth Loesch, *Secretary*, Neil T. Chamberlin, *Treasurer*, Herbert Decker

Members of the Council are

1935, E. D. Davy, F. W. Gehring, Eugene Reiny, H. E. Speer

1936, A. L. Flandermeyer, W. W. Hosler, Ellsworth Loesch, Edward Spease

1937, Herbert Decker, Z. M. Gibson, N. E. Scribner, A. E. Walleck

1938, F. J. Bacon, N. T. Chamberlin, A. P. Gegenheimer, E. L. McFetridge

NEIL T. CHAMBERLIN, *Secretary*

PHILADELPHIA

The November meeting of the Philadelphia Branch of the A. P. H. A. was held at the Philadelphia College of Pharmacy and Science on Tuesday evening, November 13, 1934

The speaker was Dr. David Klein, president of the Wilson Laboratories of Chicago, who spoke on glandular products from the pharmaceutical standpoint

He began with a discussion of the present Pharmacopœial assays for substances such as pepsin and suggested that a standard pepsin be used in connection with the present method

For the assay of Pancreatin he suggested the preparation of a better substrate as the starch used at present is liable to be converted in heating

In addition to the assay for powdered Thyroid it would be advisable to include assays for the tablets and capsules as well

He then spoke of desiccation and defatting of glandular products and mentioned the most advisable methods to be used for different glands

The need for chemical tests for products such as anterior and posterior pituitary and liver extract was made apparent

Dr. Klein stated that color uniformity was impossible to maintain in ovarian products because of difference in pigmentation of summer and winter foods

He was not in favor of the use of ratios for the determination of the relationship between fresh and dried glandular materials. He suggested the adoption of standard dosages for products such as Thyroid so as to prevent confusion among physicians

Dr. Klein concluded his lecture with a discussion of the active principles of the ovary, pituitary, suprarenal and thyroid. Colored pictures of the glands were shown as lantern slides

About 30 minutes of discussion preceded the adjournment

E. H. MacLaughlin, *Secretary*

F E R A PRESCRIPTION PRICE SCHEDULE

BY L. A. SELTZER

Prescriptions covered by this schedule are classified as follows: Simple Liquids, Compound Liquid Mixtures, Liquids Administered in Drop Doses, Bulk Powders, Capsules, Powders, Tablets, Suppositories, Ointments, Compound Ointments, Lotions and Gargles

Simple Liquids are those which contain one item only such as U. S. P. and N. F. or other liquid preparation commonly carried in readiness for dispensing. In computing the cost of *Simple Liquids*, the material is priced at 15 cents per oz. to which a fee of 25 cents is added, this sum divided by 2 constitutes the price. Thus a 4 oz. mixture should be priced at 43 cents.

Compound Liquid Mixtures are those consisting of two or more ingredients, the dispensing of which constitutes compounding. In computing the price of *Compound Liquids*, the material is priced at 25 cents per oz., to which a fee of 25 cents is added, this sum divided by 2 constitutes the price. Thus a 4 oz. mixture in this class should be priced 63 cents.

Liquids Administered in Drop Doses—In computing the price of prescriptions of liquids administered in drop doses the material is priced at 25 cents per oz., to which a fee of 75 cents is

added, this sum divided by 2 constitutes the price. Thus a 1-oz or 2 oz prescription in this class should be priced at 50 cents and 63 cents, respectively.

Bulk Powders—In computing the price of medicine dispensed in the form of bulk powder the material is priced at 25 cents per oz. by weight, to which a compounding fee of 50 cents is added, this sum divided by 2 constitutes the price. Thus a 4 oz prescription in this class should be priced 75 cents.

Capsules and Powders—In computing the price of capsules and powders the material is priced at the rate of 3 cents for each unit, plus a 50 cent fee, this sum divided by 2 constitutes the price. Thus twelve units in either of those two classes should be priced 43 cents.

Tablets—In computing the price of tablets, the price is based on the manufacturer's whole sale list plus $\frac{1}{2}$ cent for each tablet, plus a 50 cent fee, this sum divided by 2 constitutes the price.

Suppositories—In computing the price of suppositories, the material is priced at 5 cents for each unit, plus compounding fee of \$1.00 divided by 2 constitutes the price. Thus, twelve suppositories should be priced 80 cents.

Ointments—In computing the price of ointments, the price of 1 oz., 2 oz. and 3 oz., is determined empirically at 50 cents, 75 cents and \$1.00 respectively, which prices are divided by 2. In the event four or more ounces are prescribed, the material is charged at the rate of $12\frac{1}{2}$ cents per ounce plus a \$1.00 fee, the sum in each case divided by 2 constitutes the price. Thus the final price of 1-oz. should be 25 cents, 2 oz., 38 cents, 3 oz. 50 cents, 4 oz., 75 cents, 6-oz 88 cents, 8 oz., \$1.00.

Compound Ointments are those containing two or more ingredients, the dispensing of which constitutes compounding. In computing the price of *Compound Ointments*, the price of 1 oz., 2-oz., 3 oz. is determined empirically at 50 cents, 60 cents and 85 cents respectively. In the event that four or more ounces are prescribed the material is charged at the rate of 25 cents per oz. plus \$1.00 compounding fee, the sum in each case being divided by 2. (S. L. Hilton suggests a higher basic price for ointments, because of additional time and labor required.)

Lotions—In computing the price of lotions, the material is priced at 10 cents per oz., plus a 50-cent fee, divided by 2 equals the price. Thus, 4 oz. calamine lotion should be priced 45 cents.

Gargles—In computing the price of gargles the material is priced at 5 cents per oz. plus a 50-cent fee, divided by 2 equals price. Thus, 4-oz. Dobell's Solution should be priced 35 cents.

Exceptions—In the event that in any prescription the cost of any ingredient exceeds the amount allotted as material, then the actual net cost of such expensive ingredient should be added to the amount provided for cost of material in any of the above formulas.

Specials—Through your Committee the F. C. R. A. has arranged to supply Insulin at 15 per cent above wholesale cost. Mineral oil, cod liver oil, milk of magnesia, etc., when prescribed in the quantities usually marketed under their respective labels and in case the labels must be replaced by a prescription label giving physician's directions for use are priced as follows: Double the ruling selling price, add 25 cents for labeling fee and divide this sum by 2.

Warning—With reference to prescriptions dispensed which are not U. S. P. or N. F. you are cautioned that the government will not allow a larger fee than a like amount of official preparation would cost. If it exceeds that amount you have recourse to calling the physician or returning the prescription to the patient without filling.

Do not fill prescriptions for bandages, surgical dressings or other preparations which are available for office treatments.

THE ATLANTIC CITY SESSION AMERICAN MEDICAL ASSOCIATION

The fifteen sections of the Scientific Assembly A. M. A., have appointed exhibit committees to assist in the promotion of section exhibits at the Atlantic City session and in the coordination of activities between the Scientific Assembly and the Scientific Exhibit.

EDUCATIONAL DIRECTORY

Part IV Educational Associations and Directors, "Educational Directory," 1935, issued by the U. S. Department of the Interior lists the American Association of Colleges of Pharmacy and the AMERICAN PHARMACEUTICAL ASSOCIATION.

EDITORIAL NOTES

THE SOCIAL SECURITY PROGRAM

It is overwhelmingly important," President Roosevelt advised Congress in his special message, "to avoid any danger of permanently discrediting the sound and necessary policy of Federal legislation for economic security by attempting to apply it on too ambitious a scale before actual experience has provided guidance for the permanently safe direction of such efforts"

The *New York Times* states editorially "Although it is truly sweeping in nature, the President's social security program has been carefully worked out with unusual precautions to keep it on a practical basis For this reason it will be disappointing to any who expected the Committee on Economic Security to work miracles But thoughtful students of social problems may be expected to indorse most of the underlying principles out of which this policy has evolved"

UNITED STATES CIVIL SERVICE EXAMINATIONS

The United States Civil Service Commission has announced open competitive examinations as follows Principal Pharmacologist, Senior Pharmacologist, Pharmacologist, Associate Pharmacologist, Assistant Pharmacologist

Applications for the positions named for employment under the Food and Drug Administration, Department of Agriculture, must be on file with the U S Civil Service Commission at Washington, D C, not later than March 11, 1935

The entrance salaries range from \$2600 00 a year for the assistant grade to \$5600 00 a year for the principal grade, subject to a deduction of not to exceed 5 per cent during the fiscal year ending June 30, 1935 as a measure of economy, and also to a deduction of 3 1/2 per cent toward a retirement annuity

Certain specified education and experience are required

Full information may be obtained from the Secretary of the United States Civil Service Board of Examiners at the post office or custom-house in any city which has a post office of the first or the second class or from the United States Civil Service Commission, Washington, D C

BROADCASTS

Purdue University School of Pharmacy, through its Extension Department, is conducting weekly broadcasts at 12 45 to 1 00 P M each Wednesday The chief purpose of these talks is to impress the laity with the facts about their druggist and his position in the community in which he practices

Such topics as "The Prescription," "The Story of Camphor," "Pharmacy in the Home," "The Clinical Thermometer," "Evolution of Drugs" and others are used Druggists are urged to tell their customers to tune in on these talks coming from station WBAA which operates on 890 kilocycles

PUBLIC HEALTH COUNCIL OF KANSAS

The Public Health Council of Kansas, composed of members of the professions of medicine, dentistry and pharmacy, has been organized The officers are *President*, Harry Lutz, M D, Augusta, *Vice-President*, W C Westcott, D D S, Leon, *Secretary*, MacChilds, Pharm D, El Dorado *Treasurer* C M Kelley D D S, El Dorado

The first bulletin of the Council has been issued and gives the history of the organization, its constitution, rules and regulations Units will be established in counties, a purpose is to supply medical and related aid and cooperate in promotions in which one or all of the professions are interested Those desiring information about the organization may address Secretary MacChilds El Dorado

A NEW BASE FOR SUPPOSITORIES

H Gfeller states that suppositories of cacao butter soon become rancid, and if the fat has a melting point corresponding to the lower limit of the Swiss Pharmacopoeia (29° C) they may melt in hot weather He proposes to substitute a hardened arachis oil of m p 32° to 33° C This is a lower melting point than that of the Oleum Arachidis Hydrogenatum of the new Pharmacopoeia corresponding to a lower degree of hydrogenation The acid value of this material was 0-3 the iodine value 67.3 It becomes rancid much less quickly than cacao butter, it solidifies quickly, is odorless and colorless The transformation of the unsaturated triolein to tristearin is an advantage as

it facilitates the incorporation of aqueous solutions—*Quarterly Journal of Pharmacy and Pharmacology*

PERSONAL AND NEWS ITEMS.

The Foster Hall reproductions of the songs of Stephen Foster at the central building of the Public Library were donated by Josiah K. Lilly. He devoted years to the study of Stephen Foster's work and established Foster Hall for the perpetuation of the poet's memory.

The *Merchants' Index* publishes an article on "Mankind and Medicines," by Chairman Anton Hogstad, Jr., of the National Pharmacy Week Executive Committee.

Louis Wait Rising, University of Washington School of Pharmacy, comes from Rutgers University. Prior to going to Rutgers, Professor Rising was connected with the University of South Carolina School of Pharmacy as associate professor. He received his pharmacy degrees at Oregon State College. Both Mr. and Mrs. Rising are natives of Oregon.

Dr. Wolfgang Felix von Oettingen, formerly Assistant Professor of Pharmacology at Western Reserve University, Cleveland, has been named for the supervision of the Haskell Laboratory of Industrial Toxicology of the E. I. du Pont de Nemours & Co., Wilmington, dedicated January 22nd. A complete library is to be provided for use in studying toxicological problems in the field of industrial hygiene.

Tribute is paid to Frederick J. Wulling, a former president of the AMERICAN PHARMACEUTICAL ASSOCIATION, under "American Contemporaries" in the News Edition of *Industrial and Engineering Chemistry*, of January 10, 1935. The writer of the article is C. H. Rogers, whose contact with Dean Wulling enables him to present a pen picture of a man, who is honored at home and by his associates and fellow workers. The article was not read in time to comment on this deserved tribute.

Dr. Erwin E. Nelson, of the University of Michigan, has been appointed Principal Pharmacologist in charge of the Drug Division of the Food and Drug Administration, according to an announcement by W. G. Campbell, Chief. Doctor Nelson has already assumed his new duties.

Dr. Hugh S. Cumming, surgeon general of the United States Public Health Service, returned on December 18th after visiting Buenos Aires to attend the ninth annual Pan American Sanitary Conference.

Eli Lilly & Co. has established under the

auspices of the American Chemical Society a research award of one thousand dollars and a bronze medal to stimulate research in biological chemistry.

Sir Henry Wellecome was decorated with the Cross of the Legion of Honor of France, November 23rd.

C. H. Searle, with Mrs. Searle, is leaving within the next few days on a business trip to Honolulu, Japan, China and the Philippines.

H. J. Holthoefer has been elected for the tenth term as secretary of the Chicago Retail Druggists' Association. This is the 50th anniversary of the organization and the members are putting forth every effort to make this a successful year.

Hajime Hoshi, president of the Hoshi Pharmaceutical Co., Ltd., of Tokyo, which controls almost 20,000 drug stores in the Orient, was a recent visitor in New York.

The Winthrop Chemical Company, Inc., manufacturers of ethical pharmaceuticals, has acquired all tangible and other assets of the H. A. Metz Laboratories, Inc., with which it has been closely associated since 1926. Both companies have been engaged for many years in the development of the synthetic chemical industry in the United States.

An old time drug store exhibit was presented to the Milwaukee Public Museum by local druggists. The suggestion for the exhibit came from John Diller who suggested it as a memorial to his brother, George A. Diller.

The Chemical Foundation, Inc., New York City, has favored the JOURNAL with a copy of "The Farm Chemurgic" by Wm. J. Hale. The author instructively presents the importance of the farm to national and industrial life. We have also received from the Chemical Foundation, Inc., a brief in the matter of a proposed reciprocal trade treaty between the United States and Switzerland submitted on behalf of Chemistry in the United States, by Francis P. Garvan, representing the Chemical Foundation, Inc., the Chemical Alliance, Inc., Synthetic Organic Chemical Manufacturers' Association, Manufacturing Chemists Association of the United States. It is a plea for chemical industry in the United States. Every business in the country, including agriculture, is becoming daily more and more dependent upon chemical industry, and the public should be informed.

The Chemical Foundation has also favored us with a reprint copy of a letter to the President from George N. Peck on foreign trade.

SOCIETIES AND COLLEGES

NEW JERSEY FORMULARY

The Committee on Professional Relations of the New Jersey Pharmaceutical Association and Sub Committee on Medical Practice of the Welfare Committee of the Medical Society of New Jersey are cooperating in the development of a Formulary. A series of formulas has been endorsed and from time to time these formulas will be published and thought is being given to supplying a loose leaf binder to physicians for filing the formulas in permanent form.

THE NATIONAL ASSOCIATION OF DRUG CLERKS, INC., TO BE DISSOLVED

Advice has been received that it has been decided to liquidate the Druggists' National Home and dissolve the Illinois Corporation not for profit. The National Association of Drug Clerks.

NEW JERSEY BOARD OF PHARMACY

Failure to display a renewal certificate in New Jersey constitutes a violation of the Pharmacy Act and is punishable by a fine of not less than \$25.00.

The regulations for the Act are entitled 'Pharmacy or Drug Store Defined,' 'Registered Pharmacist Continuously in Charge,' 'Permit Required,' 'Change of Location,' 'Change of Ownership,' 'Prescription Equipment Required,' 'Number of Pharmacists per Store,' 'Display of Permit,' 'Renewal of Permit,' 'Information Required,' 'Temporary Permits,' 'Permit Required of Each Store,' 'Suspension or Revocation of Permit,' 'Failure to Receive Notice No Excuse.'

REVOCATION LAW

The Board of Pharmacy of the State of New Jersey may refuse an application for examination or may suspend or revoke the certificate of a registered pharmacist or a registered assistant pharmacist for any of the following causes: When the application or registration is shown to have been obtained by misrepresentation or fraudulent means, or when the applicant or registrant is guilty of chronic or persistent inebriety, or addiction to the use of narcotic drugs or has been convicted of violating any law of this or any other State or of the United States relating to narcotic drugs or has been convicted of violating the provisions of

any law relating to the sale of liquors, or has been twice convicted of violating any law relating to the practice of pharmacy, or has been convicted of a crime involving moral turpitude, or has impersonated an applicant for registration before the Board. Before a certificate shall be refused, suspended or revoked, the accused person shall be furnished with a copy of the complaint and given a hearing before the Board. Any person to whom a certificate shall be denied by the Board or whose certificate shall be suspended or revoked by the Board shall have the right to appeal by *certiorari* to the Supreme Court for a review of such action."

HOSPITAL ABANDONS LABORATORY PRACTICE IN MEDICINE

The custom of charging private patients in its university hospital for 'purely professional services' by the laboratory departments will be abandoned by George Washington University School of Medicine, in accordance with a resolution which the faculty adopted. This action was taken in order that such purely professional fees may be handled directly between the consultant and the patient. Professional services such as the interpretation of roentgenograms and supervision of administration of roentgen therapy are the responsibility of the consultant, the resolution further points out. On the other hand, the faculty regards the technical work of its laboratories as purely nonprofessional and approves in principle the levying of charges to any person or patient for technical services rendered and for the use of its laboratory facilities. Concluding the resolution, the faculty submits the thesis that the practice of medicine in public or private laboratories, staffed by non professional people, begins only if at all, at the point at which such technical data are interpreted and applied to the patient for the diagnosis, treatment and prognosis of disease processes.

INSECTICIDE, DISINFECTANT ASSOCIATION

Increased support of the code of fair competition and a closer observance of contemplated restrictive legislation pointing toward a revision in Federal and State food and drug acts were urged at the twenty first annual meeting of the National Association of Insecticide and Disinfectant Manufacturers held December 10th and 11th.

Many scientific papers and discussions were read and interest was shown in code matters and the possibility that certain restrictive legislative tendencies would materialize. A committee was appointed to study laws, proposed laws and legislative tendencies affecting manufacturers of insecticides and disinfectants. Dr Robert C White asked the members for continued support. Ovid J Roberts, NRA Deputy Administrator, who addressed the convention Tuesday, was confident that approval of the budget would be made shortly, and urged continued interest in code affairs.

The Association elected the following officers and governors: *President*, C P McCormick, Baltimore, Md., *First Vice President*, W H Eddy, Rochester, N Y, *Second Vice President*, William Griesener, Baltimore, Md., *Secretary*, John H Wright, New York City, *Treasurer*, John Powell, New York City.

RHODE ISLAND PHARMACEUTICAL ASSOCIATION

Rhode Island Pharmaceutical Association reelected Clarence A Vars, president, Joseph L McDonald, Providence, vice president, and James J Gill, Providence, was reelected secretary-treasurer. The Association, at its annual meeting in Providence on January 9th, voted to submit a list of ten names to the Governor of leading pharmacists qualified to advise relative to pharmaceutical activities. It is understood that the purpose of the administration is to merge all activities of public health professions in one body.

BROOKLYN PHARMACEUTICAL ASSOCIATION

The pharmaceutical associations of Brooklyn have united those bodies in one organization under the name of Brooklyn Independent Pharmacists' Association.

OKLAHOMA PHARMACEUTICAL ASSOCIATION

Oklahoma Pharmaceutical Association is endeavoring to enact a law which will require a licensed practicing pharmacist to supervise the sale of all drugs, poisons or preparations classed as drugs. Another change provides that all moneys received over and above the expenses of the State Board of Pharmacy shall be retained by the Board as a treasury fund for the succeeding year.

Another provision strengthens the law relating to peddling of medicines and another will give to the Board of Pharmacy power to appoint its own attorney to prosecute violations of the law.

PHI DELTA CHI

The Grand Council of Phi Delta Chi, professional fraternity of pharmacy and chemistry, will convene in annual session at the Emerson Hotel in Baltimore, February 7th-8th. Iota Chapter of the University of Maryland College of Pharmacy will be the host.

We have received from pharmacist Svend Nielsen of Copenhagen a reprint on American Pharmacy. Reference is made to the several contributions on professional pharmacy by Professor C B Jordan. The title of the contribution is *Amerikanske Apoteksforhold*.

We are indebted to Secretary H C Christensen for a set of Proceedings, 25 volumes of the National Association of Boards of Pharmacy, from 1908 to 1933.

A serum he described as able to kill cancer cells removed from the human body and do no harm to healthy tissue similarly removed was announced December 5th by Dr Thomas Lumsden, whose last ten years have been devoted to the fight on cancer.

A CORRECTION

Howard H Crosbie, writing relative to his article in November JOURNAL, page 1111, states that the second line under Fig 1, last sentence, should read "Right, After injection of 2 cc—Sept 12 1934," not—*Right*. After injection of 1.75 cc—Sept 26, 1934." He writes that the latter statement invalidates the logic of the reading matter—we are therefore pleased to comply with the author's request in making the correction.

PATRICK J CUDDYER

Patrick J Cuddyer, 73 S Boston druggist active in civic affairs, died November 30th, from a heart attack while in his drug store. His death follows by three weeks that of his wife, Mary E Devine Cuddyer.

Mr Cuddyer was a past-president of the Massachusetts Pharmaceutical Association and of the South Boston Citizens' Association, president of the Trade Association of South Boston and a member of the executive boards of the Boston and National Associations of Retail Druggists.

LEGAL AND LEGISLATIVE

REPORT OF THE COUNCIL ON PHARMACY AND CHEMISTRY ON REVISION OF THE FOOD AND DRUGS ACT IN SPECIAL REFERENCE TO DRUGS

The following report, published in the *Journal of the American Medical Association* of January 12th, is reprinted here as a source of information on the views endorsed by the Board of Trustees of the American Medical Association on Federal food and drug legislation

'1 To include provisions for so regulating all forms of drug advertising that it shall be truthful in statement and not deceptive by implication, the terms 'advertising' to include all ways and means of bringing articles to the attention of the public for commercial purposes

"2 To provide that responsibility for advertising rest with the individual or firm issuing it unless such individual or firm produces a guaranty as to the truthfulness of the advertising claims and the guarantor is amenable to the terms of the act in which case the guarantor shall be responsible

"3 To provide that the active ingredients and the amounts or proportions thereof in all mixed drug products not listed in official compendiums (U S P and N F) be disclosed on the labels of such products and in the advertising of them

"4 To prohibit the sale of drugs and drug preparations under names recognized in official compendiums (U S P and N F), unless such drugs and drug preparations meet the standards and specifications laid down in such compendiums

"5 To require suitable declaration on labels and in advertising of any and all habit-forming drugs, whether sold singly or in mixtures together with explicit warning that such may be habit forming, provided that such declaration be not required in the case of drugs or mixtures of drugs dispensed on prescription and which are to be used according to directions of a physician

"6 To provide for official announcement by the government of such drugs as may now be held, or in the future be determined, to be habit forming

"7 To prohibit the mention of disease names on the label of drugs or drug preparations, or in advertising thereof unless such drug or drug preparation is a cure for the disease named, or unless such drug or drug prepara-

tion is a palliative and the nature of the palliative action is stated

'8 To extend the provision of the law to include cosmetics and the advertising thereof the term 'cosmetics' to include all substances and preparations intended for cleansing, altering the appearance or promoting the attractiveness of the person unmedicated soaps excepted

"9 To extend the scope of the term 'drug' to include devices, substances and preparations intended for the treatment of disease and all devices and all substances and preparations, other than food, intended to affect the structure or any function of the body, this provision to be for purposes of the act and not to regulate legalized practice of the healing art

'10 To prohibit the addition of drugs to foods and confections intended or offered for general human consumption but not to prohibit such addition to, or other modification of foods and confections intended or offered to meet special nutritional requirements or dietary needs, provided the label and advertising of products so treated plainly declare the character and purpose of such modifications

"11 To require that testimonials and opinions used in advertising of drugs and drug preparations be accompanied by the name and address of the writers thereof and to consider such testimonials and opinions as advertising claims of the advertiser

12 To provide by permit or license or other means for government control over the sale and distribution of such drugs and therapeutic agents as cannot be adequately controlled by gross inspection or chemical examination of the finished product except that this shall not apply to the provisions of the Serums and Vaccines Act of 1902 and amendment thereto

"13 To require each importer, manufacturer, jobber and retailer engaged in interstate commerce in drugs and therapeutic agents to register with the government his name, place of business and the character of the business in which he is engaged or proposes to engage, such registration to be granted without cost to the applicant and accepted only on evidence showing adequacy of plant equipment and personnel for the business proposed

"14 To provide for cooperation between federal and state governments in the enforcement of food and drug laws in their respective

jurisdictions on a plan similar to that provided in 'An Act to Create in the Treasury Department a Bureau of Narcotics, and for Other Purposes, approved June 14, 1930'

15 To require labels on drugs and drug preparations to bear the name and address of the manufacturer, seller or distributor, and to bear a statement of the net weight or volume of contents

'16 To provide for more adequate penalties, which will be commensurate with the seriousness of violations''

FOOD AND DRUG BILLS IN CONGRESS

There are now three bills in Congress which seek to amend or displace the present Food and Drugs Act, and there is a possibility for the presentation of others

Senator Royal S. Copeland has introduced S 5 and this has been referred to the Committee on Commerce

Representative James M. Mead of Buffalo, N. Y., has presented H. R. 3972 and this has been referred to the Committee on Interstate and Foreign Commerce

The *Druggists Circular* states that the Mead bill differs from the Copeland and McCarran bills in the senate in three major particulars (1) It would amend the existing act, rather than write a wholly new law, (2) its definitive provisions are specific rather than a greater or less delegation of authority to the Secretary of Agriculture, (3) it places control of advertising in the hands of the Federal Trade Commission, with injunctive relief in emergency

Senator Pat McCarran of Nevada has introduced S 580 which embodies the revision plan of Charles Wesley Dunn

The numbers of the bills are given so that officers and members of legislative committees can apply to their Senators and Representatives for copies of the bills

The president has not endorsed any of the bills, but is most interested in the enactment of a law at this session of Congress

CAUSES FOR REMOVAL OF CODE AUTHORITIES

An administrative order issued by the Recovery Board states causes for removal of members and employees of code authorities. These are

(1) Conviction of code violation or removal of Blue Eagle involving any firm with which the member is in any way connected

(2) Commission of a criminal, tortious or

illegal act in connection with the activities of the code authority

(3) Conviction of crime involving moral turpitude, after selection as a member of the code authority

(4) Obstruction of the administration of the code

(5) Neglect of duty

NIRB SEEKS TO END MULTI CODE RULES

The National Industrial Recovery Board has approved an order under which retailers will be required to pay only one code assessment regardless of the number of retail codes which affect the business. The principal line of business must be certified

PENNSYLVANIA PRESCRIPTION TAX UPHELD

The Supreme Court of Pennsylvania has ruled that the tax on doctors' prescriptions, provided for in the State Emergency Relief Sales Tax Act of 1932, is legal. The ruling is of importance to druggists, inasmuch as it is estimated that back taxes will have to be paid on a state tax that no longer exists

Prescriptions in Utah come under the 2 per cent sales tax

HEALTH INSURANCE BILL

A resolution calling for "the best and most effective kind of federal legislation to provide a system of health insurance throughout the United States" has been introduced in the Senate by Senator Hugo L. Black of Alabama. It proposes a "full" investigation by the Senate Committee on Education and Labor

Simultaneously, with the introduction of the resolution, the American Association for Social Security made public a social security bill which will be introduced as a model measure in 43 state legislatures

It is understood that Senator Black later will introduce a federal subsidy bill with the social security bill as a basis, plus the findings of the Senate committee

The bill for the states includes a health insurance system under which the great proportion of those earning less than \$3000.00 a year would receive essential medical services and part compensation of loss of income by illness

Basically the social security measure aims at the establishment of a statewide insurance fund supported by employees, employers and

the state. The purpose of Senator Black's bill is to provide a subsidy to states enacting health insurance on the lines drawn by the social security bill.

Abraham Epstein, executive secretary of the social security organization, declared that the bill is not an attempt to reorganize medicine — From *Drug Topics*

ADVERTISEMENT BILL

Representative John T. Buckbee, of Illinois has introduced a bill under which the mails and radio would be denied to a person disseminating misleading advertising, penalty is provided.

TAX-FREE ALCOHOL

Representative Woodruff of Michigan introduced H R 1425 which would authorize the withdrawal of alcohol tax free for the use of any clinic operating for charity and not for profit including use in compounding of bona fide medicines for treatment outside of such clinics but not for sale.

BOARD DIRECTED TO ISSUE LICENSE

In a Mississippi case a pharmacist who had been granted a license in Louisiana applied for a license in Mississippi. The law makes it mandatory that the State board of pharmacy license as a registered pharmacist any person of good moral character who had after examination been licensed to practice pharmacy in another state prior to December 31 1927. A review of the case states that the Board had taken no action in the matter and hence the court action. After review of the case the court reversed the judgment of the lower court and directed the State Board of Pharmacy to issue a license to the applicant to practice as a registered pharmacist.

DRUG STORE SIGNS IDENTIFY THE ESTABLISHMENT

The defense in four cases in California were found guilty in each case and appealed. Their appeals were consolidated. Two cases were reversed because the complaint failed to prove and there was no proof adduced to show that the signs designated in the law were displayed on the store owned by the defendants. The court accordingly reversed the convictions in these two cases. In the other two, because of an error in assessing penalties on these defendants, the cases were remanded to the trial court with directions to impose the proper penalties.

WEST VIRGINIA CHAIN STORE LICENSE TAX UPHELD

The right of states to levy a tax on chain stores was upheld by the Supreme Court of the United States in a recent decision of a case brought by the Standard Oil Company of New Jersey.

The decision specifically upheld the chain store license tax which is in force in West Virginia.

RECOMMENDATION FOR REVISION OF NRA

The National Industrial Recovery Board has received a memorandum from the Consumers Advisory Board containing recommendations for the revision of the National Industrial Recovery Act. Although there has been no opportunity for formal consideration of these recommendations, which were submitted January 5th, the National Industrial Recovery Board immediately made them public in the belief that discussion of all such proposals is desirable.

BLUE EAGLES

The National Industrial Recovery Board announced recently that Blue Eagles for particular trades and industries marked "1934" as well as those originally issued under the President's Reemployment Agreement, may be used in 1935.

NARCOTIC PEDLERS SENTENCED

Fifteen narcotic pedlers were sentenced by Judge William H. Atwell in the United States District Court at Dallas.

TAX COMMISSION REFUNDS IN OHIO

The Tax Commission of Ohio has issued a notice to dealers relative to refunds on unused cosmetic stamps. The Cosmetic law was repealed January 1st and there will be no cosmetic tax until after the sales tax receipts are obtainable by dealers.

A MISLABELED ELIXIR OF TERPIN HYDRATE AND CODEINE

A qualifying word, such as "special" used in conjunction with the name of a product listed in the National Formulary, is not sufficient legal grounds for varying an N F formula, Judge D. J. Patterson of the United States District Court, Southern District of

New York, ruled in the case of the United States of America against seized bottles of *Chlor Terpin Hydrate and Codeine*

Testimony showed that the product did not conform to the standard required by the National Formulary. The claimant contended that the word "special" after the name on the label was an indication that the product is not the *Chlor of Terpin Hydrate and Codeine* defined in the Formulary, but is a variation. After hearing testimony Judge Patterson gave the following opinion:

The question is not what the chemist or the druggist may understand by the addition of the word 'special' to the title. The Food and Drugs Act was passed as a protection to the uninformed, that they might be assured that an article purchased was what it purported to be.

Certainly the average consumer would not be put on guard that a compound called '*chlor terpin hydrate and codeine (special)*' was not the *chlor of terpin hydrate and codeine* listed in the formulary. The word 'special' might well signify to him merely that the ingredients were especially pure or that the product was manufactured with special care. If a manufacturer wishes to use a National Formulary name for a non-conforming product it is his duty to give the public unmistakable notice that in its composition there has been a departure from the formula given in the Formulary."

The Judge then quoted from the regulations for enforcement of the Food and Drugs Act Regulation 7 (b), which provides: "A drug sold under a name, or a synonym, recognized in the United States Pharmacopœia or the National Formulary which does not conform to the standard of strength, quality or purity for the article as determined by the test laid down therein shall be labeled with a statement to the effect that the drug is not a United States Pharmacopœia or National Formulary article."

On the basis of this, Judge Patterson ruled that the bottles were misbranded.

Judge Patterson also gave his opinion on whether there was adulteration or misbranding on the score that the contents of the bottles did not correspond with the declarations on the labels. His opinion on this read in part:

"The labels stated that each ounce contained one grain of codeine sulphate and eight grains of terpin hydrate. There was testimony by government chemists that on analyses there

was more terpin hydrate than the quantity declared and less codeine sulphate. On the other hand, there was testimony that when compounded the products had precisely the quantities specified on the label, and there was testimony that the test for terpin hydrate is not a satisfactory one.

"The variations found by the government chemists, taken as a whole, are not wide and I am not prepared to say that they are beyond the zone of experimental error and tolerance in manufacture. The burden of proof is on the United States and the proof does not establish adulteration or misbranding by reason of discrepancy between the quantities set forth on the labels and the contents of the bottles.

'There will be a decree of forfeiture for adulteration and misbranding. Findings in conformity with this opinion may be submitted.'—*Drug Trade News*

TAX ON TOILETRIES

It is stated that the battle in Congress will be to prevent an increase in taxes on toiletries and not in an effort to eliminate the taxes.

NEW NRA POLICY OF PUBLICIZING DRUG CODE VIOLATIONS

Settlement of a complaint against Ford's Cut Rate Drug Stores, Buffalo, N. Y., which charged violation of the loss limitation provision of the retail drug code has been announced by the NRA Compliance Division. The settlement, which was in the form of an affidavit signed by Otis C. Altfeld, is the first to be announced by the Compliance Division under a new policy which contemplates full publicity concerning alleged code violations.

Complaint was filed by S. N. Vaughn, secretary of the Buffalo Retail Drug Code Authority. A number of specific violations were charged in an affidavit presented to the board by Mr. Vaughn among them being the selling of many products at cut prices.

The National Industrial Recovery Board has appointed Dr. Gustav Peck as assistant to the Administrative Officer on employment problems in codes and their administration. This appointment is in line with the Board's policy of allotting specific problems to personnel well versed in the subjects assigned them.

Dr. Peck was graduated from Columbia University and received his Ph.D. degree from Brookings Institution.

OBITUARY

FREDERICK BARNETT KILMER

Frederick Barnett Kilmer, director of the laboratories of Johnson & Johnson, New Brunswick N J, and father of Joyce Kilmer, the poet who was killed in action in France, died December 28th, at his home in New Brunswick aged eighty-three years

Mr Kilmer was born in Chapinville, Conn, the son of Charles Kilmer, a Methodist clergyman, and Mary Ann Langdon Kilmer. He was educated in the public schools of Binghamton, N Y, Wyoming Seminary Kingston, Pa, and the New York College of Pharmacy. He took special courses in chemistry at Columbia, Yale and Rutgers. He owned a drug store in New Brunswick before he was chosen to head Johnson & Johnson's scientific department in 1899.

Mr Kilmer had been president of the New Brunswick Board of Health, adviser to the New Jersey State Board of Health and a member of the American Public Health Association. He was a member of a number of foreign and American organizations among them the American Chemical Society, the American Institute of Chemical Engineers, the Chemists Club of New York. He was a former vice president of the American Drug Manufacturers Association and a member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1886.

Mr Kilmer married Miss Annie E Kilburn December 25, 1871. They had four children all of whom are dead. Mrs Kilmer died three years ago. Further reference is made to the deceased on page 3 of this issue of the JOURNAL.

JOSEPH H DOW

Joseph Henry Dow, member of the AMERICAN PHARMACEUTICAL ASSOCIATION, well and favorably known Maine pharmacist, died at his residence in Portland, December 29th, aged 76 years. He was chairman of the Entertainment Committee when the ASSOCIATION met in Portland.

Mr Dow was born in Portland the son of Joseph and Sara Dow and attended the Portland public schools. He was a charter member of the Portland Cadets, rising in rank to sergeant and 2nd lieutenant, but withdrawing upon his acceptance of a position as a drug salesman with Cook, Everett and Pennell which entailed long absences from Portland. He was one of the original members of the Cadet drill

squad, and in recognition of his interests in this organization and his services to it he was elected every year from 1910 president of the Cadets, and in 1928, life president of the Honorary Association.

As a salesman for two Portland firms and with Brewer and Co. of Worcester, his connection at the time of his death, he traveled all over the State for 55 years and had friends in every community that boasted a drug store.

Partly as a result of this wide acquaintance, Mr Dow conceived the idea of forming the Maine Pharmaceutical Association. He was for many years a member of its executive committee, and for 15 years had been chairman of its committee on general arrangements for the annual meetings.

He was also instrumental in the formation of the Maine Commercial Travelers' Association in which he from time to time held office.

Surviving him are his son, Walter P Dow, two daughters, Mrs Guy F Dunton and Mrs Verne A Stahl, and two brothers George W of West Southport, and Charles now a resident of California. His wife, who was Annie C Curtis of Biddeford, died in 1909.

SMITH C WILSON

SMITH C WILSON, member of the AMERICAN PHARMACEUTICAL ASSOCIATION and prominent in Nebraska drug circles, died December 8th, at Bryan Memorial Hospital, Lincoln, aged 73 years. The following is prepared from a sketch by Secretary J G McBride.

Born at Bergens Mills New Jersey, Mr Wilson came west half a century ago and since that time had been in the drug business. He first went to Cheyenne, Wyoming, and later moved to St. Louis, where he joined Meyer Brothers' wholesale drug house. Mr Wilson then became connected with the Capital Drug Company, a Lincoln wholesale concern, and later entered the retail business.

In 1929, he was elected president of the Nebraska Pharmaceutical Association in which he had worked for forty years. Through his association work he was one of the best known and most influential druggists in the state.

Last February, Mr Wilson was elected president of the Nebraska Society of the Sons of the American Revolution. He was one of the two Nebraska members of the Society of Cincinnati, deriving his eligibility from the

New Jersey branch His descent was through his mother from Captain James Anderson

The following letter from John O'Brien, of Omaha, is reprinted from the *Northwestern Druggist*

"Smith was a man gifted with rare ability. He was vigorous, hopeful and uplifting. He was endowed with great capacity for work, illuminated with a great purpose, unrivaled in aggressiveness, rich in sympathy and consideration for his fellowmen. His genius has often been shown in the constructive work that he did in local, state and national pharmaceutical affairs for the past thirty years. He has served in the ranks. He has served as chairman of every committee in his state organization, and he has filled the office of president with honor to himself and credit to his fellowmen. Smith Wilson was a man of his convictions and he had the moral courage to pass them on to others, not by dictation but by arguments addressed to common sense.

"Mr Wilson's hobby was organization work and he took a great interest in attending conventions and delighted in renewing old friendships. He boasted that he had only missed one meeting of the N Ph A in forty-five years. Almost yearly he attended the conventions of the Iowa, South Dakota, Kansas and Missouri associations. He was a lover of the out-of-doors and never missed a chance to fish or hunt. Only this fall he made a trip of over one thousand miles to hunt pheasants in Dakota.

"He is survived by one son and a grandson, his wife having preceded him in death five years ago."

HUGO KANTROWITZ

Hugo Kantrowitz, member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1907, died January 18th, at his home in Richmond Hill, N Y, aged 80 years.

The deceased was born in Breslau, Germany, April 8, 1854, and came to this country with his widowed mother and other members of the family in 1856. He received his early education in Philadelphia and as a youth was employed with the *Philadelphia Demokrat*, a German newspaper. In 1878, he removed to New York and engaged with the *New Yorker Zeitung*.

In 1880 the *Deutsche Apotheker Zeitung* was established and in its promotion and service Mr Kantrowitz was active until its discontinuance a few years ago, and as editor and publisher he furthered a relation of German and

American pharmacists which reflects credit. The *Zeitung* was the official organ of the German Apothecaries Society and maintained a professional relationship with other pharmaceutical publications and the editor was always a welcome visitor in their offices. He took a deep interest in the Veteran Druggists' Association and the German Apothecaries Society and was an honored life-long member of both organizations.

He was a member of New York College of Pharmacy, Columbia University, of New York Pharmaceutical Association, of the German Press Club (New York) and of the Steuben Society of America. He was a regular attendant at the annual meetings of the State association and of the AMERICAN PHARMACEUTICAL ASSOCIATION.

Mr and Mrs Kantrowitz celebrated their golden wedding anniversary in 1926, the latter and a daughter, Mrs Claire Muller, survive the deceased. Nathaniel Nicolai in speaking of him said: "At an age well past seventy—he enjoyed life more like a youth just experiencing his first freedom. More than fifty years he served pharmacy—loyally, unselfishly, gladly, efficiently. He served both continents—was known in Europe as well as in the United States, the country of his adoption, was universally respected and beloved. The German apothecaries here, owe much to his life and work."

ISRAEL H SHURTLEFF

Israel Hammond Shurtleff, member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1875, died in New Bedford, Mass., on December 15th, while engaged in his pharmacy, a business founded by him in 1878.

Mr Shurtleff was born in Mattapoisett, Mass., April 7, 1849, the son of Alvah and Joana Shurtleff. After the completion of his earlier education he engaged with James E. Blake and, later, with William A. Pease of New Bedford. In 1878, he entered business on his own account and continued actively until his death, his son, Frederick A. Shurtleff, is now the manager of the pharmacy. Mr and Mrs Shurtleff celebrated the golden anniversary of their marriage in 1880.

Mr Shurtleff had been a member of the Massachusetts State Pharmaceutical Association since its organization and a member of the Independent Order of Odd Fellows for more than fifty years.

BOOK NOTICES AND REVIEWS

Our Willie By JOHN URI LLOYD author of Etidorpha, Stringtown on the Pike Red Head, Warwick of the Knohs Scroggins, Felix Moses the Beloved Jew Published by John G Kidd & Son, Inc Cincinnati 375 pages Price \$2 50

In reviewing a book by one who has contributed largely to the success of the AMERICAN PHARMACEUTICAL ASSOCIATION, has served well in its offices and held membership in it for a longer period of time than any other member and is still deeply and actively interested, the reviewer very willingly permits the promptings of friendship and regard to accompany his thoughts even though they do not enter into these lines. Preceding books by the same author were read by this writer as issued and copies of them are part of his library—this personal note will be pardoned.

This year the author of *Our Willie* celebrated his 85th birthday and the story is published more than thirty years after a large part of it had been written, it was completed because of a promise to Mrs Lloyd a few days before her departure on November 27, 1932.

Our Willie may be designated a companion volume to *Stringtown on the Pike* in it the author introduces Silas and Sarah, of the primitive highlanders of Boone County, Kentucky. The love for their son who has brought hope and happiness to their humble home also becomes the source of grief. The characters depicted play their part before the readers—pathos, humor and thrilling action form a trinity that endows the plots and counterplots of the book with the vividness of reality, spiced with a mystery that intrigues the reader's interest.

Clara is the heroine, the childhood sweetheart of *Our Willie* is constantly loyal, "Judge Elford is the lovable but just judge who impresses the readers with the majesty as well as the humanity of the law, Squire Gettem is the villain, who is the nemesis of *Our Willie*, of Silas and Sarah of the slave boy Kola and who almost outwits Judge Elford."

Daily life of the section might echoing with muffled hoof beats and war days add to the action of the story.

The illustrations are interesting they are from photographs by Mrs J U Lloyd, Olita Lloyd daughter of J T Lloyd, and the author is the youthful fisherman in the frontispiece. J K Lilly has contributed a reproduction of

the front cover of Stephen A Foster's *Melody*, "Willie We Have Missed You," dated 1854.

Hand Book of Chemistry Compiled and edited by NORBERT ADOLPH LANGE, Ph D, Assistant Professor of Organic Chemistry at Case School of Applied Science, Lecturer in Organic Chemistry at Cleveland College of Western Reserve University, member of the American Chemical Society and of the Deutsche Chemische Gesellschaft—assisted by Gordon M Forker and Richard Stevens Burington, Ph D, Assistant Professor of Mathematics at Case School of Applied Science, published by Hand Book Publishers, Inc Sandusky, Ohio 1545 pages Price \$6 00 Bound in fabricoid.

This *Hand Book of Chemistry* differs from other books of this kind because of the large amount of material contained for those engaged in all divisions of the chemical industry. The author states that this book is the result of a number of years' experience in compiling and editing of data useful to chemists. An effort has been made to select material to meet the needs of chemists who should have the information at hand or without prolonged search and for those who have not the facilities of a large technical library.

In glancing through the pages one is impressed with the successful effort made to select a great variety of information from all branches of science as well as in the commercial fields. The information presented is in condensed form, much of it arranged in a tabular way so as to conserve space and give the information that is needed by chemists, physicists, mineralogists, engineers, librarians, patent attorneys, pharmacists, dieticians, manufacturers, physicians and others. Thus are tabulated physical constants of inorganic compounds, nomenclature of organic compounds, names and formulas of organic radicals are given together with information regarding name synonym, formula boiling and melting points etc. Other tabulations are concerned with properties of materials as to their physical, thermal properties, etc.

Among outstanding new features is information regarding hazardous chemicals their handling, changes in atomic weight, between 1894 and 1933, a mineral table, tables for water chemists, classification of crystals, organic reagents, laboratory solutions, etc.

Other pages are given over to refrigeration antifreeze solutions, definitions of pharmaceutical terms and various conversion factors

A number of pages list and define laboratory solutions. A number of pages are given to laboratory arts and recipes. More than 200 pages are devoted to logarithms in varied calculations and applications.

The extent of information given is represented by the index of thirty pages.

Modern Drug Encyclopedia and Therapeutic Guide by JACOB GUTMAN, M.D., Pharm.D., F.A.C.P. Consultant, Manhattan General Hospital New York, Riverside, Shore Road Williamsburg Maternity and Borough Park General Hospitals, Brooklyn, formerly Professor of Materia Medica, College of Dentistry, University of State of New Jersey, Professor, Chemical Chemistry, Jersey City College of Pharmacy, Instructor in Medicine New York Post Graduate Medical School and Hospital Attending Physician, Wyckoff Heights and Unity Hospitals, Brooklyn. Publisher, Paul B. Hoeber, Inc. 76 Fifth Ave., New York. 1394 pages. Price \$7.50.

The author states that this treatise is designed to meet the demand of the progressive physician for information concerning the most modern therapeutic agencies placed at his command by research laboratories. It presents without bias or comment all the popular non-pharmacopœial preparations and other remedies found useful in the treatment of disease.

The contents is presented in 15 chapters including the following: 1040 Drugs of Known Constitution and Action, 408 Effective Combinations of Two or More Fully Defined Ingredients, 346 Preparations of Unstated or Incompletely Defined Components, 860 Endocrine Preparations, 1563 Hypodermic Medicaments, 535 Biologicals, 2223 Individual and 121 Group Allergens, 209 Foods and Beverages, 122 Bottled Mineral Waters, Natural and Artificial, 644 Miscellaneous Products, Therapeutic Guide, Bibliography, Manufacturers and Distributors' Index, Drug Index.

The titles of the divisions indicate the purpose and scope of the book, for which there is evidently a need and the extent of the references is presented by an index of 220 pages. The encyclopedia deals largely with medicinals that are controlled by manufacturing houses and gives the name of each house in connection

with that of the medicinal, one section of the book is given over to an alphabetical list of the names and addresses of the manufacturers under each of which names is a list of the house's specialties.

Most of the information contained in the volume may be found in medical and pharmaceutical publications and literature sent out by manufacturers, but reference thereto is not readily located unless indexed, hence physicians, pharmacists, dentists and nurses will find "The Encyclopedia and Therapeutic Guide" a valuable time saver.

WAGNER BILL S 1130

The Committee on Economic Security in a report states that it is not prepared at this time to make recommendation for a system of health insurance. Cooperation has been asked of advisory groups representing the medical and dental professions and hospital management in the development of a plan for health insurance which will be beneficial alike to the public and the professions concerned.

Senator Wagner of New York has submitted S 1130, known as the Wagner Bill for Social Insurance which provides for a social insurance board appointed by the President. The Committee on Economic Security recognizes that the successful operation of a plan depends in a large measure upon the provision of sound relations between the insured population and the professional practitioners or institutions furnishing medical services under the insurance plan.

The report of the Committee submits the main lines along which its studies are proceeding. The fundamental goals of health insurance, the administration of the services of the medical professions, exclusion of commercial or other intermediary agents, the basis of benefits of the insurance, the payments for the service, state wide basis under a federal law, cash payments in partial replacements of wage loss, cost of health and medical services, correlation of existing health and medical services, health and medical services for persons without income.

The Committee concludes that—'The role of the federal government is conceived to be principally (a) to establish minimum standards for health insurance practice and (b) to provide subsidies, grants or other financial aids or incentives to states which undertake the development of health insurance systems which meet the federal standards.

As the measure will affect pharmacy, it is necessary for pharmacists to study its trend so that they may cooperate in shaping this important legislation

NOTICE TO CONTRIBUTORS TO THE JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION

The following notice has been prepared from comments received from members of the Board of Review of Papers and of the Publication Committee

Manuscripts should be sent to Editor E. G. Eberle, 2215 Constitution Ave., N. W., Washington, D. C.

All manuscripts should be typewritten in double spacing on one side of paper 8 1/2 x 11 inches and should be mailed in a flat package—not rolled. The original (*not* carbon) copy should be sent. The original drawings, not photographs of drawings, should accompany the manuscript. Authors should indicate on the manuscript the approximate position of text figures. All drawings should be marked with the author's name and address.

A condensed title running page headline, not to exceed thirty-five letters, should be given on a separate sheet and placed at the beginning of each article.

Numerals are used for figures for all definite weights, measurements, percentages and degrees of temperature (for example 2 Kg., 1 inch, 20.5 cc., 300° C.). Spell out all indefinite and approximate periods of time and other numerals which are used in a general manner (for example one hundred years ago, about two and one half hours, seven times).

Standard abbreviations should be used whenever weights and measures are given in the metric system e. g. 10 Kg., 2.25 cc., etc. The forms to be used are cc., Kg., mg., mm., L. and M.

Figures should be numbered from 1 up, beginning with the text figures (line engravings are always treated as text figures and should be designed as such) and continuing through the plates. The reduction desired should be clearly indicated on the margin of the drawing. All drawings should be made with India ink, preferably on white tracing paper or cloth. If coordinate paper is used, a blue-lined paper must be chosen. Usually it is desirable to ink in the large squares so that the curves can be more easily read. Lettering should be plain and large enough to reproduce well when the drawing is reduced to the width of a printed page (usually about 4 inches). Photographs intended for half tone reproduction should be securely mounted with colorless paste.

'Figure' should be spelled out at the beginning of a sentence, elsewhere it is abbreviated to 'Fig.,' per cent.—2 words.

The expense for a limited number of figures and plates will be borne by the JOURNAL, expense for cuts in excess of this number must be defrayed by the author.

References to the literature cited should be grouped at the end of the manuscript under the *References*. The citations should be numbered consecutively in the order of their appearance (their location in the text should be indicated by full sized figures included in parentheses). The sequence followed in the citations should be: Author's name (with initials), name of publication, volume number, page number and the date in parenthesis. Abbreviations for journals should conform to the style of *Chemical Abstracts* published by the American Chemical Society.

(1) Author A. Y., *Am. J. Physiol.*, 79, 289 (1927).

Papers presented at the Sections of the AMERICAN PHARMACEUTICAL ASSOCIATION's annual meeting become the property of the Association and may at the discretion of the Editor be published in the JOURNAL. Papers presented at these Sections may be published in other periodicals only after the release of the papers by the Board of Review of Papers of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The Editor will appreciate comments from Board of Review and Committee on Publication members, authors and others interested.

THE UNITED STATES PUBLIC HEALTH SERVICE

PARTS OF THE SURGEON GENERAL'S REPORT TO CONGRESS FOR 1934

It is interesting to note that for the calendar year 1933 the general death rate, 10.5 per 1000 population, was the lowest ever recorded in the United States, and the rate for 1932 was next lowest, 10.8 per 1000. While health conditions remained comparatively good for the first half of 1934, the death rates for many localities were higher than those for the preceding year.

In spite of the economic conditions, the number of deaths from tuberculosis continued to decrease. For the calendar year 1933 the death rate was 59 per 100,000 population—5 per cent below the previous low minimum. The typhoid fever death rate was also the lowest ever recorded—only 3.5 deaths per 100,000, which was 8 per cent below the previous minimum. The diphtheria rate dropped to 3.0 per 100,000—also the lowest death rate ever recorded by the Public Health Service for this disease.

Smallpox, the principal scourge of mankind in the last century, still caused more than 75,000 deaths in countries sufficiently advanced in health matters to keep vital statistics records, but less than 40 of these deaths occurred in the United States, although nearly 7000 cases of the disease were reported. Several European countries have advanced so far in preventive activities that they did not have a single case of smallpox in 1933.

The Public Health Service covers a broad field in its research activities in the cause and prevention of disease. Its principal laboratory is the National Institute of Health in Washington, but it also maintains field laboratories in various parts of the country. The subjects of research include, among others, cancer, encephalitis, heart disease, leprosy, malaria, psittacosis, Rocky Mountain spotted fever, tularemia, tick fever, child hygiene, dental conditions, industrial dermatoses and milk sanitation.

By means of animal experimentation, a new method was discovered for the treatment of bichloride poisoning in human cases. It was shown in actual cases that death from otherwise fatal doses of bichloride can be prevented when formaldehyde sulphonylate is given by mouth and injection into the vein within a reasonable time after the poison has been swallowed.

The Public Health Service was recently authorized by law to conduct two Narcotic Farms, i. e., hospitals for the treatment of Federal prisoners who are narcotic addicts, and to furnish medical and psychiatric care to prisoners in Federal penal and correctional institutions. The first of these Narcotic Farms is under construction at Lexington, Ky., and will be completed by April 1935. The other Farm is located at Fort Worth, Texas, and funds for beginning construction were made available through the Public Works Administration. At the close of the year the Public Health Service was operating 17 medical units in connection with the care of the inmates of Federal penal and correctional institutions.

In the field of public health, new problems constantly arise and new dangers appear, such as those illustrated by the unusual type of encephalitis appearing in St. Louis in 1933, the extensive outbreak of amoebic dysentery in Chicago, and the necessity for the control of distillery wastes which are now being emptied into already heavily overtaxed and polluted streams, thus seriously affecting the water supplies of the country. Constant vigilance is required for the early detection and study of these new continually arising dangers to the public health in order successfully to combat them.

A HOMER SMITH

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIV

FEBRUARY, 1935

No 2

THE PRESIDENT OF THE AMERICAN DRUG MANUFACTURERS' ASSOCIATION

Alfred Homer Smith, reelected president of the American Drug Manufacturers' Association, 1934-1935, was born in Smyrna, Delaware, December 17, 1879, the son of Alfred Henry and Emily (Brown) Smith. After completing his studies in Smyrna high school, he engaged in a retail pharmacy and then matriculated at the Philadelphia College of Pharmacy and Science, graduating in 1902. Thereafter he was salesman for H. K. Mulford Company, then district manager and secretary and general sales manager of the corporation.

He received appointment as Lieutenant Colonel in the U. S. Army during the World War and served on the War Industries Board, Council on National Defense and National Advisory Council, Treasury Department, U. S. A.

From 1920-1922, Mr. Smith was secretary and member of the Board of Directors of E. R. Squibb & Sons and is now president of Sharp & Dohme.

Before his election to the presidency of the American Drug Manufacturers' Association, Mr. Smith served on a number of important committees, as secretary and first vice-president of the Association.

He is a member of the Board of Trustees of the Philadelphia College of Pharmacy and Science and holds membership in a number of organizations, among them, the Manufacturers, Bankers, Art, Philadelphia Country and Corinthian Yacht Clubs; he is a life member of the AMERICAN PHARMACEUTICAL ASSOCIATION.

February 3, 1908, Mr. Smith married Evelyn Hagen, of Lancaster, Pa. (b. Charlotte, N. C.), they reside in Alden Park, Germantown, Philadelphia, Pa.

EDITORIAL

E G EBERLE, EDITOR

2215 Constitution Ave., WASHINGTON, D C

FIRST AID WEEK

THE week of March 11th to 16th has been designated "First Aid Week," a purpose is to acquaint the public with the means for rendering first aid to injured and to those who suddenly become ill. Another purpose is to display preparations that may be employed in cases of injury and illness.

How far the pharmacist can go in rendering service when called upon to relieve the afflicted is a subject that should receive consideration, for selfish motives may bring about unfortunate results. There can be no objection to displays of first-aid articles but the rulings on the extent of medical advice by pharmacists are not uniform in all states. A leading Massachusetts case lays down the principle that "If a pharmacist sells medicine, receiving payment therefor, and gives advice gratuitously as to the use to be made of it, he is not holding himself out as a physician." The various licensure acts, however, are more and more tending to restrict the legal limits of such advice.

In 1928, the United States Public Health Service prepared an article, published in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION (page 699), which advises that every one become familiar with first-aid methods for treating the injured. "First aid has been defined as the temporary care of an injured person by simple, commonsense methods, based on principles of medicine and surgery, that may be applied easily by persons not professionally trained in these subjects." It should be noted that the work of first aid ceases when the injured person has been turned over to the care of a physician.

When it is recalled that more than 28,000 persons are killed in the United States by traffic accidents, over 13,000 by falls, more than 6000 by burns and drowning, over 27,000 by other accidental means and a greater number are more or less seriously injured and many are taken suddenly ill, the importance of first aid is realized and the effort to supply the needs under these conditions must be considered as a worthy service.

Every home needs first-aid means, and to belittle efforts as mercenary, because sales may bring financial returns, is not proper or right. The advice of this comment is directed to use First Aid Week for rendering service and to encourage study of the proper means and correct methods for application, so that commonsense advice can be given to those who need it. The displays should be planned to acquaint the public with the professional service of pharmacists and not bring into evidence items that are strictly merchandise. A week devoted to display of the lines indicated is deserving of encouragement, and it is hoped that all pharmacists will take an active part in this annual event.

THE NARCOTIC DRUG TRAFFIC

DURING recent months there have been quite a number of convictions for illegal sale of narcotics. At a meeting in Geneva of the Advisory Committee on Traffic in Drugs of the League of Nations, it was stated that although the steady flow of drugs from licensed factories into illicit traffic had much decreased, clandestine

tine factories were springing up and becoming a more abundant source of supply than the authorized factories had been. Study is being given to the organization of a specialized police force for the detection and closure of these factories and the development of an effective way of combating illicit traffic.

Jean Perrigault reported on the conditions in the Paris (France) press which were verified by the Commission. Production in some countries is kept to a high level and it is from the overflow that large amounts of the smuggled products reach the United States, *where earnest efforts are made to confine the supply of narcotics to lawful use*. There is lack of effort to control in sections of the Far East, the drug peddler is a menace, but countries that permit the manufacture of narcotics without proper restriction of their use are contributing a much greater harm. Smoking opium is being manufactured in excess of that being used under license and the surplus is a source of morphine and heroin for illegal purposes.

He who conducts his business on a dishonest basis must realize that it is only a question of time when he shall have to quit, and to the extent that there is dishonesty in business, to that extent is such business jeopardized. There is a selfishness in narcotic production more sordid than that which comes from the desire for gain, a selfishness which restrains the doing of service and lack of uplifting interest in the misfortune of the afflicted. Great and desirable as government may be, failure to use it in the interest of humanity adds to the responsibility of those to whom the power of government has been given. It is better to set human beings free than to enslave them, to extend aid than to oppress, to construct than to destroy, to give health than to make miserable, to lift up than to press down.

A SERVICE LIBRARY

THE library of the AMERICAN INSTITUTE OF PHARMACY is developing and members have an opportunity in aiding this service by the donation of books pertaining to pharmacy and allied sciences. The library has rendered service to divisions of the Government and departments have found desired information in its volumes, also individuals and schools. The mails frequently bring requests for information and it is gratifying that in most instances it has been possible to render service.

Modern libraries are provided with windows suitable for exhibits. A writer on the subject of window displays in the *Library Journal* states that these should be changed at regular intervals, they should deal with timely subjects, carefully planned—the changes based on a sequence or they may differ from preceding displays, the purpose of all of them is to interest the public.

The History of Science Society held its December meeting in the AMERICAN INSTITUTE OF PHARMACY and for this occasion several show-case displays were arranged of books dealing with the history of pharmacy which attracted the attention of the visitors and interested them. A related effort in display was made when the Round Table Medical Club held its January meeting in the building, a number of changes were made in the display and this was held over for the visit, on February 9th, of Phi Delta Chi delegates to the conclave in Baltimore, hailing from Massachusetts, New York, Nebraska, Maryland, Ohio, Iowa, Idaho, Kentucky, Colorado, North Carolina, Oklahoma, New Jersey and California.

The District of Columbia Retail Druggists' Association held its February session in the AMERICAN INSTITUTE OF PHARMACY. Comment is made on these events to impress the value of the library and to interest the visitors in increasing the number of books so that more extended library service may be rendered by the AMERICAN PHARMACEUTICAL ASSOCIATION. Numbers of volumes may not have great significance without coordinated selection in order to meet the requirements of pharmacists. The divisions of the AMERICAN INSTITUTE OF PHARMACY, it is hoped, will become service features of the ASSOCIATION.

PRIZE-WINNING PHARMACY WEEK WINDOW

Apothecaries Hall established more than a century ago in New Haven Conn. was voted the Pharmacy Week prize for 1934. The pharmacy is managed by S. G. Gessner, son of a life time member of the AMERICAN PHARMACEUTICAL ASSOCIATION, Emil A. Gessner (for sketch see page 1071, JOURNAL A. P. H. A., 1928). The latter died February 3, 1930, aged 80 years.

In 1934, a brief history of Apothecaries Hall was published in connection with the celebration of the 150th anniversary of New Haven County Medical Association and the 113th anniversary of Apothecaries Hall.

The prize-winning window display showed a miniature prescription room, equipped with fixtures, shelf bottles, utensils, show globes and sick room supplies. The cabinets are 29 inches high and 14 inches wide, the laboratory table is equipped and is 14 inches deep, 38 inches wide and 10 inches high, the refrigerator is 12 inches high and in front of it are samples of biologicals. On the prescription counter are preparations in process of compounding.

The store has an interesting collection of antique pharmaceutical equipment and Mr. Gessner uses some of them in displays. We congratulate the prize winner and the many who entered into the contest and thereby gave publicity to professional pharmacy.

The following were selected for the ten prize winning ribbons donated by the National Association of Retail Druggists, in the order named: Public Drug Company, Philadelphia, Pa.; John E. O'Brien, Omaha, Neb.; Frank Nau, Portland, Ore.; Terrant Drug Company, Birmingham, Ala.; F. S. Johnston Drug Co., Parsons, W. Va.; Carl J. Heinrich, Superior, Wis.; Morgan & Mullard, Baltimore, Md.; John A. Klingstedt, Rockford, Ill.; L. L. Eisentraut, Iowa; H. W. Reuter, St. Louis, Mo.

The following received honorable mention: Freund Pharmacy, Indianapolis, Ind.; Peoples Drug Store, Wilmington, Del.; Finley's New Store, Greenville, Miss.; Dr. Peters' Drug Store, Schulenburg, Tex.; Ballou Latimer Drug Co., Boise, Idaho; Hoagland's Drug Store, New Brunswick, N. J.; Ace Drug Co., San Diego, Cal.; R. J. Allen Drug Co., Sioux City, Iowa; Nathan A. Mazer, Denver, Colo.; Funk's Pharmacy, Cleveland, Ohio.

Members of National Pharmacy Week Window Display Contest Committee: Chairman, John F. McCloskey, E. A. Kimzey, J. Culver, P. Grossman, A. Worner.

A STUDY OF CALOMEL FROM THE PHYSICAL AND THE CHEMICAL STANDPOINT *

BY CHARLES H IAWALL AND JOSEPH W D HARRISSON

The two chlorides of mercury have had a long and interesting history. The mercuric chloride dates from the Arabian period under Geber in the 9th century, while the mercurous chloride seems to have first appeared in the 16th century and is described in the works of Beguin and Crollius, under the name of "dulcified mercury."

It has appeared in more physical forms and under a greater diversity of Latin and common names than any other official chemical salt.

It has appeared in every edition of the United States Pharmacopœia.

In the U S P of 1820 directions were given for the preparation of calomel from "oxy muriate of mercury" (corrosive sublimate) and purified mercury, which was three times sublimed and then levigated and elutriated.

In 1830 the process was changed in that mercuric sulphate was first prepared from mercury and sulphuric acid, and this was then mixed with salt and sublimed and the sublimate subsequently purified with solution of ammonium chloride and boiling water and finally levigated and elutriated.

In 1840 the same process was directed as in 1830 with the addition of a test to exclude soluble chlorides.

No further change was made until 1880 when the formula was discontinued and identity tests were added as well as tests for absence of mercuric chloride.

It was not until 1910 that an assay method was introduced. It was in the 1890 Pharmacopœia that a descriptive requirement was introduced which has remained essentially unchanged for four decades and which reads as follows:

'A white impalpable powder becoming yellowish white on being triturated with strong pressure, and showing only small isolated crystals under a magnifying power of 100 diameters.'

This requirement probably originated in the fact that in European pharmacy two calomels had been recognized, one for sublimed calomel (which was described as distinctly crystalline) and the other for calomel prepared with steam, which was described (as in the paragraph quoted above) as showing under the same magnification (100 diameters) only a few isolated crystals. This same requirement occurs in the 6th edition of the German Pharmacopœia (1926) and in the 4th edition of the Belgian Pharmacopœia (1930).

The reason for this investigation is a rather curious and unusual one.

A private client came to us with the statement that he had suffered from a non-specific urethritis which had been caused by the irritating effect of a prophylactic ointment which had been injected into the urethra.

* Scientific Section, A Ph A, Washington meeting, 1934

Investigation of this ointment showed the presence of a large number of sharp pointed acicular crystals of calomel and as none of the calomels which were easily accessible showed a microscopic appearance, anything like the specimen in question, it was decided to make a complete study of the calomels made by different manufacturers both in America and in Europe

The American calomels were obtained by corresponding with the respective manufacturers, while the European calomels were obtained through the kind assistance of Dr. Joseph Rosin, of Merck and Company. In this investigation we have examined sixteen specimens of at least seven different origins, as follows

American manufacturer	A	2 specimens
American manufacturer	B	6 specimens
American manufacturer	C	1 specimen
German manufacturer	A	3 specimens
French manufacturer	A	1 specimen
French manufacturer	B	1 specimen
English	A	1 specimen
Of unknown origin		1 specimen

For many years there have been three different types of calomel described in the literature, differentiated by their methods of manufacture and their titles, and by specific recognition in some of the European pharmacopœias

These different types are discussed at some length in "Hager's Handbuch der Pharmaceutischen Praxis," the following abstracts being taken from the 5th edition of that famous work, published in Berlin in 1907, where photographs are shown of their comparative appearance when examined under the microscope

They are distinguished by the following Latin titles

- A *Hydrargyrum chloratum præparatum*
- B *Hydrargyrum chloratum vapore paratum*
- C *Hydrargyrum chloratum præcipitatum*

Type A is made by subliming a mixture of mercuric chloride and metallic mercury

This type is first produced in white, glistening masses of crystalline texture, the product being subsequently reduced to a fine powder by levigation and purified with water in unglazed porcelain mortars or in ball mills

It occurs as a fine, impalpable, yellowish white, dustless powder, which has a tendency to agglutinate and which under microscopic examination is found to consist of broken crystal fragments which are larger in size than those observed in other types

Type B is made by permitting calomel vapor (obtained by a reaction similar to that described above or by starting with the crude product made as above, before levigation) to come in contact with steam or cold air in a closed vessel or chamber. Under these conditions the calomel condenses in the form of small crystals and crystal aggregates. It is not always necessary to levigate this variety but it is sometimes done

It occurs as a dusty powder which does not show a tendency to cohere when pressed between the fingers. Under the microscope it shows translucent prismatic crystals of a great variety of sizes and shapes and of which the individual particles are smaller than in A

Type C is made by precipitation. There is a choice of a number of methods of which the two following are typical. In one method a dilute solution (1 in 30) of mercuric chloride is saturated with purified sulphur dioxide. After several hours standing to complete the reduction and precipitation, the precipitate is collected, washed and dried. In another method mercurous nitrate solution is precipitated with a diluted hydrochloric acid and the precipitate subsequently collected, washed and dried.

Precipitated calomel is a heavy, fine, amorphous, white powder, greasy to the touch and very adherent to the fingers. It is the finest of all of the types in the size of the particles when subjected to microscopic examination.

All three of these types are light sensitive in the presence of moisture and must be dried and handled in the dark before finally packaging for the market.

Types A and C have the property of agglutinating and both varieties are unsuitable for dusting purposes.

Calomel specimen No 1 (Specimens Nos 4, 10, 12 and 15 were of similar appearance)

Calomel specimen No 2 (Specimens Nos 3 and 14 were of similar appearance, No 14, however, contained more acicular crystals)

Type B does not agglutinate and is suitable for dusting, and according to Hager is the variety to be dispensed when "calomel" is ordered.

Type A is known by the following Latin names

Hydrargyri subchloridum

Hydrargyrum chloratum

Hydrargyrum chloratum mite

Hydrargyrum chloratum mite sublimatum paratum

Hydrargyrum chloratum mite praeeparatum seu levigatum

Type B is known by the following Latin names

Hydrargyri chloridum nate

Hydrargyrum chloratum vapore paratum

Calomel vapore paratum

Type C is known by the following Latin names

Hydrargyrum chloratum via humida paratum

Hydrargyrum chloratum mite praecipitatione paratum

The specimens were labeled as follows (omitting the name of the manufacturer)¹

1, Calomel, U S P special, finely powdered, 2, Calomel, mercurous chloride, C P, 3, Calomel, U S P, mercurous chloride, 4, Calomel, U S P X special, fine powder, 5, Calomel, mild mercurous chloride, U S P, 6, Calomel, reagent, 7, Calomel, mild mercurous chloride, U S P X, 8, Hydrarg chlor mite, sublimatum, 9, Hydrarg chlor mite, vapore paratum, 10, Hydrarg chlor mite, precip, *via* humida paratum, 11, Protochlorure demercure, calomel a la vapeur, 12 Protochlorure de mercure, precipite blanc, 13, Calomel, 14, Calomel, 15, Calomel, U S P special fine powder, 16, Calomel, sublimed, not powdered

Calomel specimen from ointment (a)

Calomel specimen No 5 (Specimens Nos 8 9 11, 13 and 16 were of similar appearance)

TABULATION OF RESULTS OF EXAMINATION OF CALOMEL SPECIMENS, APPLYING U S P TESTS

No		Assay %	Other U S P Tests
1	American manufacturer A	99 96	O K.
2	American manufacturer B	99 67	O K.
3	American manufacturer C	99 51	O K
4	American manufacturer B	99 95	O K
5	American manufacturer A	100 09	O K
6	American manufacturer B	99 91	O K
7	American manufacturer B	100 05	O K
8	German manufacturer A	99 42	O K
9	German manufacturer A	99 39	O K
10	German manufacturer A	99 69	O K
11	French manufacturer A	98 93	O K
12	French manufacturer B	99 13	O K except 0.15% residue on heating
13	English manufacturer	98 78	O K
14	American manufacturer (identity unknown)	99 13	O K
15	American manufacturer (identity unknown)	100 06	O K
16	American manufacturer (unpowdered)	100 36	O K

A small portion of the calomel was mixed on a microscope slide with a 60% aqueous solution of glycerin

An examination was first made with a 10 X eyepiece and a 4-mm objective, referred to as "low power" Further examination was then made with a 20 X eye-

¹ Five illustrations of photomicrographs of Calomel specimens are shown

NOTE The word "number" is omitted preceding specimen

piece and a 4-mm objective, referred to as "high power" The measurements were made with a stage micrometer under 8-mm objective with a 20 X eyepiece

No 1—American manufacturer A Under low power this specimen appeared crystalline but on examination under high power the particles are seen to be round or oval and do not show a crystalline structure The largest particles are less than 0.1μ in length

No 2—About half the total number of particles are clear columnar crystals about 2μ in length with the width from one fourth to one eighth of the length There are a few slender acicular crystals About half the number of particles are rosettes and crystal aggregates ranging in diameter from 0.5 to 1.5μ

No 3—This specimen is very similar in appearance to No 2 except that some of the rosettes are 2μ in diameter

No 4—This specimen is very similar in appearance to No 1

No 5—This specimen shows more crystal fragments than rosette aggregates, although they are not acicular

The crystal fragments range in size from 0.25μ to 1μ and a few even as large as 2μ The rosettes average from 0.5 to 1μ in diameter

No 6—This specimen is composed almost entirely of rosettes ranging in size from 0.5 to 2μ in diameter There is an occasional sharp pointed columnar crystal about 3μ in length

No 7—This specimen is almost identical with No 6 except that the range in size of the rosettes seems to be slightly greater the smaller being 0.25μ and the larger 3μ

No 8—This specimen is composed of fairly round rosettes mostly uniform in size, a few as small as 0.25μ in diameter and a few as large as 1μ The separate crystals are very few in number

No 9—This specimen consists entirely of small rosettes and crystal aggregates mostly ranging from 0.25 to 0.5μ in diameter a few reaching 1μ in size There are no acicular crystals in this specimen

No 10—This specimen consists almost entirely of very small blunt cylinders of uniform diameter which show no evident crystalline character under any magnification The length of these particles is about 0.1μ and the diameter is about one-fourth of the length

No 11—This specimen is composed mainly of rosettes and crystal aggregates ranging from 0.25 to 1μ in diameter There are a few separate columnar or prismatic crystals, some more than 2μ in length, and a number of smaller particles, probably broken fragments of these columnar crystals

No 12—This consists of many small irregular-shaped particles ranging from 0.2μ down to 0.05μ in size The larger particles may be aggregates of the smaller ones There are very few columnar or prismatic crystals

No 13—This specimen is composed entirely of rosettes and crystal aggregates, averaging from 0.25μ to 0.75μ with a few as large as 1μ

No 14—This specimen which is of unknown origin, contains the largest proportions of acicular or columnar crystals of any specimen examined

The acicular crystals range from 0.5 to 2.5μ in length, the width being from $1/8$ to $1/4$ the length

The rosette aggregates which constitute the remainder of the specimen are rather uniform in size, averaging 0.75μ in diameter

No 15—This specimen consists of small particles mostly cylindrical or rod shaped, some few of which show a crystalline structure The largest rod-shaped particles are about 0.2μ in length, but there are many particles less than 0.1μ in diameter

Calomel specimen No 6 (Specimen No 7 was of similar appearance)

No 16 —This specimen shows a variety of forms of particles. There are some isolated crystals (not acicular), a few rosettes, a number of crystalline aggregates and some very small particles. The range in size is from 0.05 to 0.1 μ .

No 17 —(a) and (b) is a specimen of the calomel extracted from the ointment which led to the investigation.

In these specimens large and pointed crystals, some of which appear to have been eroded, are in evidence.

None of the commercial calomels are identical with this specimen in appearance, and it is possible that some alteration in the physical condition of the crystals in the ointment sample may have resulted as a consequence of the action of the fat of the ointment base on the calomel after the ointment was prepared.

The results of the survey are interesting as showing the high quality to which the specimens conformed and also as illustrating the wide variance in size and type of particles as shown by the photomicrograph illustrations, all of which are on the same basis of magnification.

THE ASSAY OF CITRINE OINTMENT *

AN EXPERIMENTAL STUDY ¹

BY THOMAS G. WRIGHT

INTRODUCTION

The Citrine Ointment of to day is an ointment which is essentially a mixture of mercuric nitrate with a fatty base formed by the action of nitric acid upon lard. An ointment by this name first appeared in the London Pharmacopœia of 1650 and since that date there has been a wide difference of opinion as to its composition, stability and assay. The original preparation was a mixture of coral, limpet shells, white marble, white lead, quartz and tragacanth, incorporated with a base of hogs' lard, suet and hens' grease, but contained no mercury.

Nitrate of Mercury Ointment approximating in composition the present Citrine Ointment, first appeared in the Edinburgh Pharmacopœia of 1722 and was introduced, according to Christison's Dispensatory, as a substitute for a then popular proprietary remedy, 'Golden Eye Ointment,' an ointment of yellow oxide of mercury. It was not until 1746 that a similar ointment was admitted to the London Pharmacopœia. A milder ointment, one made with twice the quantity of lard, was made official in the Edinburgh Pharmacopœia of 1792. An ointment composed of mercury, nitric acid, lard and olive oil was included in the Dublin Pharmacopœia of 1807. This ointment was admitted to the British Pharmacopœia of 1864, and one of similar composition was admitted to the French Pharmacopœia at a later date. In this country, the ointment received official recognition as early as 1820, when it appeared in the Pharmacopœia of the United States under the title of Unguentum Hydrargyri Nitratis. It was readmitted at each succeeding revision of the Pharmacopœia until that of 1920 when it was dropped. Its official status, however, was not changed as it was immediately given a place in the National Formulary.

From the date of its introduction into the Edinburgh Pharmacopœia to the present time, many different formulas have been suggested for the preparation of the ointment, the principal objectives being to simplify the preparation of the elaidin base and to improve the keeping qualities of the ointment. This phase of the subject in so far as it pertains to the work reported in this paper, will be discussed in detail under the composition of the ointment.

* Scientific Section, A. P. H. A., Washington meeting, 1935.

¹ From the laboratory of A. G. DuMez, Professor of Pharmacy, School of Pharmacy of the University of Maryland. Compiled from a thesis submitted to the Faculty of the Graduate School of the University of Maryland in partial fulfillment of the requirements for the degree of Master of Science.

Considerable literature is available dealing with the preparation and stability of the ointment (1), some work on the composition of the ointment has been reported, but little has been published regarding its assay. Work along this line is therefore needed and particularly at this time when the National Formulary is being revised. It was primarily for this reason that the study reported in this paper was undertaken.

COMPOSITION OF THE OINTMENT

Before undertaking an analysis of any kind it is desirable that as much information as possible be obtained on the composition of the material to be analyzed. This is particularly true in the case of Citric Ointment. While the component of importance, from a pharmaceutical standpoint, in this instance is mercury, the analytical method selected for the quantitative determination of the mercury will depend largely upon the form in which the latter occurs in the ointment.

As stated in the introduction, the composition of the ointment has been the subject of study by several investigators (2), and while the results obtained by them, particularly those obtained by the early investigators, were not in complete accord, the following general conclusions may be drawn. The ointment is essentially a homogeneous mixture of mercuric nitrate solution with a fatty base called elaidin. It is quite probable that it contains some basic oxides of mercury in addition to the normal nitrate and that a portion of the mercury is also present as mercuric elaidate, resulting from the interaction of elaidin with mercuric nitrate.

Citric Ointment is prepared by first dissolving metallic mercury in a strong solution of nitric acid, a violent reaction occurring between these two substances with the formation of mercuric nitrate, as the chief product and probably some other compounds of nitrogen of little importance in this connection. Some investigators have expressed the view that this solution is a mixture of many chemical compounds. J. Laidley (3) believed the solution to be a mixture of mercurous and mercuric nitrates, while A. Astruc (4) considered the solution to be composed of mercuric nitrate, mercurous nitrate, nitrogen peroxide, nitrogen dioxide and free nitric acid.

The second step in the preparation of the ointment is that of preparing the base. The latter is the product resulting from the reaction occurring when nitric acid is added to lard. Lard is chiefly a mixture of the glyceryl esters of stearic, palmitic and oleic acids, the glyceryl ester of oleic acid predominating. When nitric acid is added to this mixture, it is reduced to nitrous acid and this in turn reacts with the oleic acid ester to form the isomer, elaidin, which is the ointment base. Some investigators have contended that the yellow color of the ointment is due to elaidin. H. C. Cook (5) held this view. Astruc and M. Donovan (6) on the other hand, reported the color to be due to basic mercuric nitrate, Hg_2OHNO_3 , arising from the action of nitrogen dioxide on mercuric nitrate. A. Baumé (7) claimed that a "soap" having no yellow color is formed when nitric acid reacts with fat and that precipitation of mercury in the ointment is the cause for the color formation. The explanation of Baumé is now known to be fallacious since the fat turns yellow before the mercury solution is added, and is due to the action of the nitric acid alone.

The final step in the preparation of the ointment is that of incorporating the mercury with the base. This is accomplished by dissolving the required amount of mercury in nitric acid and stirring the solution into the fat. At this point in

the preparation of the ointment, most investigators believe that a series of reactions takes place with the formation of compounds in which mercury is organically combined. This belief is probably well founded, and the compounds of mercury most likely to be formed are the salts of the fatty acids liberated in the partial hydrolysis of the glyceryl esters. The ointment, therefore, probably contains some mercuric oleate, palmitate and stearate. Elaidate of mercury should also be present for the same reason.

ASSAY METHODS

Chemical assay methods, especially those designed for the determination of pharmaceutical preparations, should be methods that are practical from the standpoint of material and apparatus used, ease of carrying out the procedure, and time consumed, but should, nevertheless, be sufficiently accurate to give results which may be depended upon arriving at a fair evaluation of the substance assayed, even though other substances of a similar nature may be present.

The assay methods for ointments containing mercury compounds, reported in the literature, were reviewed to determine if they could be adapted to the assay of Citrine Ointment. In the main, these methods consisted of the decomposition of the ointment with acid and subsequent titration of the remaining mercury solution. Most of these were rejected without experimental trial because of their complexity and because the time required to complete the assays was too great to permit of their use in practice. The procedure of I. V. S. Stanislaus and E. A. Eaton for the assay of Citrine Ointment (8) was reviewed. The method consists of treating the ointment with a solution of potassium hydroxide, allowing the mixture to stand for 24 to 48 hours for complete subsidence of the mercury oxides, precipitation of the mercury as sulphides, addition of iodine solution, and subsequent titration with sodium thiosulphate solution. Although this method seemed to be satisfactory from a theoretical standpoint, it was deemed to be unsatisfactory because of the length of time required to carry it out, and was, therefore, not given an experimental trial. The method of Strickland (9) in which the ointment is decomposed by nitric acid and the remaining mercury solution titrated with potassium thiocyanate, seemed to meet most of the requirements of a good assay process. It was, therefore, used as a basis for beginning the work reported in this paper.

EXPERIMENTAL PART

For the purpose of providing material for assay, the mercury content of which was known, it was necessary to prepare a batch of ointment using mercury of known purity. A quantity of the ointment was therefore prepared according to the directions given in the National Formulary V. Nitric acid (sp. gr., 1.42) was used and the fat was the best grade of lard obtainable. The lard was melted in a large porcelain evaporating dish at a temperature not exceeding 45° C. The nitric acid was added and the mixture was heated until the reaction between the lard and acid was complete and all of the olein was converted into the isomer elaidin. The specified quantity of mercury was then dissolved in nitric acid without the aid of heat and added to the elaidin base, which had been allowed to cool. The resulting product was stirred continuously with a glass rod until a uniform mixture of the consistence of an ointment was obtained. The ointment, when cool, was transferred to an amber colored glass jar, which was covered tightly with a ground glass cover. No contact was made, at any point in the procedure, with metallic utensils.

The mercury used in the preparation of the ointment was assayed for purity by the method of the United States Pharmacopœia X. Twelve determinations were carried out, the results of which are given in the following table.

TABLE I—ASSAY OF METALLIC MERCURY BY U S P X METHOD

Sample* No	1	2	3	4	5	6
Hg found in %	99.29	99.04	99.74	98.75	99.82	99.91

D	69.3710	2000	10	30.0	0.01003	68.9640	99.41

Summary Sample No 1 (0.52% Hg lost)
 Sample No 2 (0.48% Hg lost)
 Sample No 3 (0.59% Hg lost)

During the preparation of the ointment the reaction between the mercury and nitric acid becomes violent, with the evolution of considerable heat. Since mercury is a volatile substance, it was believed that there might be an appreciable loss, due to the heat thus generated, and that this condition was responsible for the low results obtained in the assay of the ointment by the different methods in use. To determine the accuracy of this belief three batches of mercuric nitrate solution were made using the approximate quantities of mercury and nitric acid necessary to prepare 50, 500 and 1000 Gm. of Citrine Ointment. The temperature seemed to increase directly with the size of the quantities of reacting materials used, hence the preparation of the three batches of solution in the quantities stated. The mercury required was accurately weighed and dissolved in the nitric acid which was also weighed. No external heat was applied in these cases. The solutions were titrated with *N/10* potassium thiocyanate solution in the usual manner, the results compared with the weight of mercury used and the percentage loss of mercury computed. However, the loss in mercury, if any, was not over 0.59 per cent in any case and this loss was constant irrespective of the quantity of solution prepared as shown by the results presented in the foregoing table.

As previously stated, the method of Strickland (9) seemed to meet most of the requirements for a good assay process, and the analysis of the ointment by this method was therefore taken up. This method, as published, was originally intended for the assay of Mercurial Ointment, of the United States Pharmacopœia, but, according to the originator, it would also serve for the assay of Citrine Ointment.

About 10 Gm of the ointment, accurately weighed, was heated under a reflux condenser with 100 cc of nitric acid and the heating continued until all of the mercury had been dissolved and the fatty base completely broken down. The resulting solution was filtered through cotton into a 200-cc graduated flask and a 3 per cent potassium permanganate solution was added until a permanent pink color was obtained. The solution was then decolorized with 3 per cent ferrous sulphate solution and the volume accurately made up to 200 cc with distilled water. An aliquot of this solution was titrated with *N*/10 potassium thiocyanate solution. One cc of potassium thiocyanate solution is equivalent to 0.01003 Gm of mercury.

The method as outlined in the foregoing was subjected to test in the laboratory and was found to be unsatisfactory as the results obtained with it were low and variable, as shown in Table III.

TABLE III—ASSAY OF CITRINE OINTMENT BY STRICKLAND'S METHOD

Sample No	1	2	3	4	5	6	7
Hg found in %	4.93	5.37	2.41	4.21	6.79	4.97	2.79
Hg theoretical in %*	6.97	6.97	6.97	6.97	6.97	6.97	6.97

* The theoretical percentage of mercury present was computed from the quantity of triple distilled mercury used in the preparation of the ointment, and which assayed 99.67 per cent pure metallic mercury by the U. S. P. X method.

Many hours of refluxing were required to completely break down the organic matter present in the ointment, and volatilization, due to this continued heating, was probably the chief cause of the loss of mercury.

The addition of potassium permanganate solution also gave some difficulty as a large volume of the permanganate solution was often required to bring about the permanent pink coloration.

Various other methods of analysis were tested but the results obtained were the same as those of the above procedure in every case.

Due to the low results obtained it was believed that some of the organic compounds were not completely broken up and that the resulting solution did not, therefore, contain all of the mercury. A stronger oxidizing agent was thought to be essential for complete decomposition of these compounds. The oxidizing mixture selected for trial consisted of perchloric acid (sp. gr., 1.615), 1 part, fuming nitric acid (sp. gr., 1.49), 2 parts, and distilled water, 2 parts. This combination proved to be a more efficient oxidizing mixture than nitric acid or a mixture of nitric and sulphuric acids, and was satisfactory in other respects. A method of assay based on the use of this oxidizing mixture has therefore, developed. A description of the method follows.

Place about 5 Gm of the ointment, accurately weighed, in a flask containing 50 cc of the above acid mixture and reflux until a clear solution is obtained and the brown fumes are no longer distinguishable. Dilute the solution with about 20 cc of distilled water, and pass it through a filter paper into a 100-cc volumetric flask. Wash the funnel with sufficient distilled water to bring the volume up to 100 cc. Take a 20-cc aliquot of this solution and titrate it with *N*/10 potassium thiocyanate solution, using ferric alum as the indicator, until a permanent reddish brown color is obtained. The condenser and flask used should be fitted with ground glass connections in order to avoid contamination and error which might occur from the action of the acid mixture upon either cork or rubber stoppers.

In the first trials, the assay was carried out by refluxing on a water bath and although the results obtained were all within a close range of the theoretical amount of mercury in the ointment and did not show a great variation, the time necessary for refluxing was about three and one-half hours. The results of these determinations are shown in Table IV.

TABLE IV—ASSAY OF CITRINE OINTMENT BY PERCHLORIC-NITRIC ACID METHOD HEATED OVER WATER BATH

Sample No	1	2	3	4	5	6	7	8
Hg found in %	8.60	8.57	8.10	8.34	8.61	8.24	8.11	8.38
Hg theoretical in %	8.67	8.67	8.67	8.67	8.67	8.67	8.67	8.67

In order to reduce the time factor of the assay the water bath was eliminated and the ointment was refluxed over a low open flame. With this modification of the procedure, it was found that one hour was sufficient time to decolorize the solution in every case. Two batches of the ointment were prepared and were labeled, "batch A" and "batch B." Seven assays in which this procedure was followed were run on "batch A" and ten determinations were made with "batch B." The results obtained were not only constant but as nearly accurate as can be expected of a method of this type.

CONCLUSIONS

From the results obtained in the experiments described above, the following conclusions are drawn:

- 1 Citrine Ointment is a homogeneous mixture consisting of mercuric nitrate and other mercury compounds which are uniformly distributed.

- 2 Most assay methods heretofore published are impractical for the determination of the mercury in this ointment because they are too complicated, too lengthy, and because they do not give constant results in the hands of different analysts.

- 3 Only a very slight amount of the mercury used is lost in the preparation of the ointment.

- 4 Citrine Ointment can be accurately assayed by the method proposed.

- 5 The method proposed is simple, rapid and practical.

THE PHARMACOLOGY OF GALINSOGA *¹

A SERIES OF MICRO-RESPIROMETER STUDIES

BY MARTIN A YAVORSKY WITH EDWARD C REIF ²

Preliminary experiments on the pharmacology of Galinsoga (1) indicate the presence of a principle or principles in the plant, which cause a drop in the blood pressure of the dog when certain preparations are injected intravenously

The chemistry of the plant has been studied by Dr Karl Muller (2) No reference, however, has been made to the presence of a potent or active constituent

The purpose of this paper is to describe certain experiments that were conducted to increase our knowledge of the pharmacology of Galinsoga and to add more information concerning the oxygen consumption by tissues, especially the influence upon the same by plant drugs

It is a well-known fact that tissues removed from the body of a recently killed animal will, if suspended in a suitable medium, utilize oxygen for an indefinite period. Oxidations in animal tissues can be studied by means of a micro respirometer, various types of which are described by Warburg and his collaborators (3)

Extensive studies on the influence of certain compounds on the oxygen consumption of many tissues have been made by Voegtlin, Rosenthal and Johnson (4), (5)

The action of Vitamin C on the oxidations of tissue *in vitro* has been reported by Harrison (6)

Oxygen consumption by the tissues used in this series of experiments was

* Scientific Section, A Ph A Washington meeting, 1935

¹ Submitted as partial requirement for B S in Pharmacy, School of Pharmacy, University of Pittsburgh

² Professor of Materia Medica and Botany, School of Pharmacy, University of Pittsburgh

measured in the Warburg vessels with the Haldane Barcroft manometers, using the technique described by Warburg (3)

The heart tissue of the healthy guinea pig was selected for the studies on *Galinsoga*. The tissue was finely minced according to the method used by Voegtlin and collaborators (4). This fresh tissue was used in 100-mg quantities, accurately weighed and immediately transferred to the respirometer trough. All results are reported on a basis of 100 mg of fresh tissue. Air was the source of oxygen and the carbon dioxide was absorbed by a solution of sodium hydroxide contained in a separate compartment in the respirometer trough. With few exceptions the experiments were run for a period of two (2) hours.

Experiment No. 1—Object To determine the influence of a 1% Infusion of *Galinsoga*

1—100 mg of heart tissue in Locke's Solution 2 and 3—100 mg of heart tissue in 1% Infusion of *Galinsoga*

Results The effect of the Infusion of *Galinsoga* on the same heart tissue is clearly shown. The increase in oxygen consumption caused by similar quantities of the same infusion was 95.5%.

Experiment No. 2—Object To determine if a stronger infusion would cause a relatively greater increase in oxygen consumption.

1—100 mg of heart tissue in Locke's Solution 2—100 mg of heart tissue in 2% Infusion of *Galinsoga* 3—100 mg of heart tissue in 2% Infusion of *Galinsoga*

Results This infusion caused an increase of 106.5 to 108% in the oxygen consumption. It appears as though the double strength infusion contains little more of the active constituents than the 1% infusion.

The material used consisted of the dried leaves, stems not over three (3) mm in diameter and flowers of *Galinsoga parviflora*. Infusions were made of this material according to the general method by adding boiling water to the material and allowing to stand for one (1) hour before filtering. These infusions were made using 1 and 2 Gm of the drug for 100 cc of the finished product, respectively. After filtration these preparations were buffered with the salts used in the preparation of Locke's Solution and in the same concentrations, dextrose being omitted. In all experiments where an infusion was used, 3 cc was the quantity added to the respirometer trough.

pared, treated with Litharge, filtered, Hydrogen Sulphide was passed through the filtrate, filtered, concentrated on a water-bath, product was a sticky brown mass containing crystals 100 mg of the heart tissue was suspended in Locke's Solution containing 100 mg of this crystalline mass A control was run to determine the uptake of Oxygen by 100 mg of the same material A heart tissue control in Locke's Solution was also run

Results 1—Oxygen uptake by 100 mg of the mass of crystals 2—100 mg of heart tissue in Locke's Solution containing 100 mg of the crystalline mass 3—100 mg of heart tissue in Locke's Solution

Curve 2 shows an inhibition of oxygen consumption when the crystals are added to the Locke's Solution in which is suspended the heart tissue

Experiment No 9—Object To study the influence of an Infusion of Digitalis on the oxygen consumption of heart tissue and to compare the activity of the same with the activity of an Infusion of Galinsoga

1—100 mg of heart tissue in Locke's Solution 2—100 mg of heart tissue in 1% Infusion of Galinsoga 3—100 mg of heart tissue in 1% Infusion of Digitalis 4—100 mg of heart tissue in 1% Infusion of Digitalis

Results Curves 3 and 4 indicate the action of Infusion of Digitalis in the quantities and concentration used is uniform and that Infusion of Digitalis increases the oxygen consumption of heart tissue Infusion of Digitalis in the quantities used caused an increase of 76.3 and 83% respectively Infusion of Galinsoga in the same concentration caused an increase of 105% in oxygen consumption

Experiment No 10—Object To determine the oxygen uptake by 1 and 2% Infusions of Galinsoga No tissues were used in this experiment

1—1% Infusion of Galinsoga 2—Same 3—2% Infusion of Galinsoga 4—Same

Results—While the infusion in the quantities used in these experiments show little in the way of oxygen uptake blank should always be run and proper corrections made

7 Infusion of Digitalis apparently contains a principle which causes an increase in oxygen consumption

8 This series of experiments suggest the possibility that studies of the influence of drugs on the oxidative processes in animal tissues to be measured by the use of a micro-respirometer might be the basis of the following investigations

(a) The potency of principles in plant and animal drugs

(b) The activity of the various fractions that occur during the investigative stages of drug extraction

- (c) The activity of various cardiac drugs on cardiac muscle and other tissues
- (d) The development of a method of biological assay for the standardization of the cardiac group of drugs

PHYTOCHEMICAL NOTES * 1

No 112 PRELIMINARY CHEMICAL EXAMINATION OF CORYDALIS AUREA

BY HAROLD EPPSON

Thirty-five kilograms of air-dried herb collected in full bloom near Laramie, Wyoming, at an altitude of about 7400 ft. were percolated with alcohol in a Lloyd extractor, yielding 8920 Gm. of extractive, calculated on a moisture-free basis.

The alcoholic extract was extracted with petroleum ether, yielding an oily extract that weighed 1382 Gm. This was saponified with alcoholic KOH in the usual manner.

Isolation of Dimyristylcarbinol—The saponified petroleum-ether extract was heated to remove the alcohol. Upon cooling a solid, waxy, yellow-red material formed on the surface. Additional similar material was obtained from the ether extract of the saponified fat. After repeated recrystallization from alcohol and methyl alcohol a light cream-colored material was obtained which melted at 81–82°. The acetylated product, after two recrystallizations from alcohol, melted at 44–45°. Elementary analyses yielded the following results:

	I	II	Computed for $C_{29}H_{50}O_2$
C	79.4%	79.5%	79.3%
H	13.3%	13.4%	13.3%

Upon saponification the acetate yielded as saponification values, 124, 119 and 120, respectively. The regenerated alcohol, after recrystallization from both methyl and ethyl alcohol, melted at 81–82°. Elementary analyses yielded the following results:

	I	II	Computed for $C_{27}H_{48}O$
C	81.6%	81.8%	81.7%
H	14.2%	14.2%	14.2%

* Scientific Section, A. Ph. A., Madison meeting, 1933

1 From the laboratory of Edward Kremers

According to Kipping,¹ dimyristylcarbinol melts at 80.5–81° and its acetate at 45–45.5° Sando² records the melting point of the alcohol at 81.5–82°

The total amount of non-saponifiable material obtained by shaking the saponified mixture with ether amounted to 340 Gm

The saponified fat, after removal of the non-saponifiable material, was treated with sulphuric acid to liberate the free fatty acids The free acids were treated according to the Twitchell³ method, with slight modifications and thereby separated into 180 Gm of solid fatty acids and 234 Gm of liquid fatty acids

The main alcoholic extract after extraction with petroleum ether was diluted with water and acetic acid to about 33 liters, sufficient acetic acid being added to make it about one per cent acid After standing for two and one-half days the precipitated resinous fraction, weighing about 540 Gm air dry, was filtered off The filtrate was made alkaline with ammonium hydroxide A flocculent gray-green precipitate formed and was filtered off

Alkaloid C 1—This gray-green precipitate was extracted with ether while still moist It was then dried somewhat and extracted with ether made alkaline with ammonium hydroxide Upon standing in an open beaker, the ether extract deposited a mass of nodular crystals weighing 53.5 Gm, and colored green from contaminating chlorophyll

By fractional crystallization 22 Gm of alkaloid, m p 135–138° and 31 Gm of alkaloid, m p 135–139° were obtained, called alkaloid C 1 This alkaloid is colorless in concentrated H₂SO₄ and gives immediate red color with concentrated HNO₃ It is optically active, $[\alpha]_D^{20} -265$ (in chloroform or absolute alcohol) Upon recrystallization the m p was 138–140° and $[\alpha]_D^{25} -271$ Determination of the methoxy groups gave 33.47 and 32.7 per cent, respectively

Upon cooling the HI mixture from the methoxy determination a precipitate formed This was filtered off and washed with water, giving a cream-colored powder, m p 278–280° with decomposition

Alkaloid C 2—The ammonium hydroxide precipitate after extraction with ether was dried and powdered and, further extracted with ether, made alkaline with ammonium hydroxide This ether upon evaporation deposited some needle-like crystals of alkaloid C 2 These were recrystallized from alcohol when they formed as flat shiny plates, melting at 148–149° They gave a yellow color instantly with concentrated HNO₃

This alkaloid is optically inactive The hydrochloride forms needles, recrystallized from hot water, melting at 238–239° A methoxy determination run by the Hewitt and Moore modification of the Zeisel method gave 33.7 and 34 per cent, respectively From the formula given below by Chou this shows the presence of four methoxyl groups The demethylated product recovered from the HI reaction mixture formed a cream-colored crystalline precipitate, m p gradually darkens, decomposes 278–280°

This alkaloid is probably the same as that isolated from *Corydalis aurea* by Heyl⁴ and from *C. ambigua* by Chou⁵ Chou gives the formula as C₂₀H₂₃O₄N

¹ *J Chem Soc*, 63 459 (1893)

² *J Biol Chem* 56, 457 (1927)

³ *Ind Eng Chem* 13 906 (1921)

⁴ *Apoth Ztg* 25, 137 (1910)

⁵ *Chinese J Physiol*, 2, 203 (1928), 3 69 (1929)

and the melting point of the hydrochloride as 218° , acid oxalate, m p 208° , acid sulphate, m p 238° and neutral sulphate, m p 220°

The filtrate from the ammonium hydroxide precipitate was extracted with ether. Upon standing a mixed mass of alkaloid crystals formed. From the mixed crystals a few large crystals were separated out mechanically. These weighed 6 Gm and melted partially at 100° and finally at $140-142^{\circ}$, with a rotation of $[\alpha]_D^{25} -272$. They are probably the same as C 1.

The remainder of the mixed crystal mass, weighing 30 Gm was treated with hot 95 per cent alcohol which dissolved out the clear crystals and left the round opaque nodules (D 2).

Alkaloid D 2—These insoluble nodules weighed 10 Gm, m p $197-198^{\circ}$. Recrystallized from chloroform-alcohol they melted at $200-202^{\circ}$. The chloroformic solution was yellow with a green fluorescence. The acid oxalate forms prisms, m p $242-243^{\circ}$. This alkaloid is optically inactive and contains no methoxy groups. It is similar to *Corydalis C* isolated from *C. ambigua* by Chou and which he compares to protopine.

The alcoholic solution from which the insoluble alkaloid D 2 had been filtered did not form any crystals upon standing. After solution in acid and precipitation with alkali the alkaloidal material was dissolved in alcohol and treated with charcoal. After standing several weeks some large crystals formed. These crystals melted at $140-142^{\circ}$. They have an optical rotation of $[\alpha]_D^{25} -275$. The hydrochloride forms columns from hot water, m p 260° . A methoxy determination gave 32.7 per cent methoxy groups. This alkaloid is very similar if not identical with alkaloid C 1.

AN ATTEMPT TO KETONIZE ERGOSTEROL * 1

BY E. MONESS AND W. G. CHRISTIANSEN

At the Indianapolis meeting of the American Chemical Society in March 1931, Dr. Bills reported on the heat of combustion of ergosterol. From his work he concludes that in the activation of ergosterol there is no absorption of energy, but that the activation depends upon chemical isomerization.

It is known that ergosterol has a complex molecule, part of which is alicyclic and contains an alcoholic hydroxyl group and an ethylenic linkage. Aliphatic ketones are capable of existing in an enolic form, and in some instances the compound is a mixture of the keto and enol forms. The extent to which the compound exists either as the keto or enol form is dependent upon the structure of the compound. Acetyl acetone may be used as an example.

When a compound is capable of reacting in both the keto and enol forms it will react entirely in accordance with the ketonic structure or entirely in accordance with the enolic structure, depending on the particular reaction which is being ap-

* Scientific Section, A. P. H. A., Washington meeting, 1935. ¹ Research Department of the Chemical and Pharmaceutical Laboratories, E. R. Squibb and Sons, Brooklyn, N. Y.

pled Ergosterol is known in its enolic form but as yet there is no evidence of its existence in the keto form

If it is true that the activation of ergosterol by ultraviolet light depends upon a chemical isomerization, and if ergosterol could be made to form a keto isomer, such rearrangement should result in a substance possessing anti-rachitic activity, or capable of being activated The simplest reagent which reacts specifically with ketones is hydroxylamine, and this substance was therefore used in an attempt to form the oxime of ergosterol We realized, of course, that a possible keto-enol isomerization might not be the explanation of the activation of ergosterol, but in view of Dr Bills' conclusion that activation is due to chemical isomerization, and in view of the fact that keto-enol isomerism is here theoretically possible, it was of sufficient interest to warrant investigation

In carrying out the actual experiment we subjected ergosterol to a reaction with hydroxylamine under conditions which were known to give an almost quantitative yield in the formation of the oxime of cyclohexanone Ergosterol, however failed to react and was recovered unchanged from the reaction mixture

EXPERIMENTAL

First, we repeated the work of Bayer (1) in the preparation of the oxime of cyclohexanone, in order to make certain that the conditions of the work were such as to insure a nearly quantitative yield of the oxime We then proceeded to react ergosterol with hydroxylamine, under the same conditions, as follows

1 152 Gm of pure ergosterol, m p 158°C , were dissolved in 40 cc of boiling absolute alcohol under reflux To this solution was added 0 4 Gm (2 mols) of hydroxylamine hydrochloride, and 0 6 Gm (slightly more than 2 mols) of sodium bicarbonate The mixture was refluxed for 3 hours It was then evaporated to dryness and extracted with ether The ether extract was evaporated to dryness, yielding 0 8 Gm of a white substance having a melting point of 157°C We had thus recovered most of our ergosterol in an unchanged condition

OPENING OF THE LEXINGTON FEDERAL NARCOTIC FARM

The first United States Narcotic Farm, near Lexington, Ky, will open for the reception for admissions on or about May 1st According to the *Journal A M A*, of February 16th it will accommodate a maximum of 1000 persons and is designed to accommodate males only Its object and purposes are to rehabilitate, restore to health and train to be self supporting and self reliant those who are admitted thereto The control management and discipline are to be maintained for the safe

keeping of the individual and the protection of the community Experiments are to be carried on to determine the best methods of treatment and research in this field and the results disseminated to the medical profession and the general public to the end that states may make some provision for establishing a similar policy for helping to solve the problem of drug addiction The function of the institution at Lexington therefore assumes the character of a treatment and research center and of an educational and rehabilitation center with certain custodial features superimposed

ADSORPTION OF STRYCHNINE SULPHATE BY VARIOUS CHARCOALS
AND BY LLOYD'S REAGENT¹BY JOHN F SUCHY² AND R V RICE

In various phases of industry charcoal ranging from the crude technical product to the highly activated form finds much practical application. The pharmacist in his field is often called upon to use charcoal either as a filtering or as an adsorbent medium and as a rule but little consideration is given to the amount of active medicinal ingredient which may be lost in the process. It is also of interest to know relatively the adsorbing power of these filtering media.

The present research was undertaken to gain some information as to the diminution of potency of strychnine sulphate solutions when brought in contact with a number of commercial charcoals and with Lloyd's Reagent. The results obtained show relatively the adsorbing powers of these media with respect to almost any dissolved substance (1).

EXPERIMENTAL

Identical procedures were followed in all cases to show the variation of adsorption of strychnine sulphate by the various adsorbing media. Groups of from five to ten samples were run together, each sample representing a different concentration of strychnine sulphate.

The following procedure was employed:

Exactly one Gm of adsorbent was weighed out and a calculated quantity of strychnine sulphate added. To this was added exactly 100 cc of distilled water and the mixture tightly stoppered and warmed on a steam-bath until solution of the alkaloidal salt was effected. Each flask was then cooled to 25° C and allowed to stand for 24 hours in a wall case where the variation of temperature was not over 2 degrees. The contents were shaken frequently to aid in reaching equilibrium. After the proper time interval, the mixtures were filtered and a 25 cc portion of each was pipetted into a separatory funnel. The solution in each case was made alkaline with 5 cc of 10 per cent ammonia and allowed to stand a short time until completion of precipitation. The strychnine was then entirely extracted with chloroform, the latter being added in small portions. Each chloroformic solution was filtered into a tared beaker which was then placed in a 50 degree oven where the solvent was evaporated. The residuc was finally dried in another oven at 100° C for about 30 minutes, weighed and calculated as the sulphate. The difference between this result and the original weight of the sulphate gave the amount of the latter adsorbed per Gm of charcoal.

Each sample of the strychnine salt used in this study was assayed by dissolving a carefully weighed quantity in water, making the solution alkaline with ammonia and extracting the resulting alkaloid with chloroform. The strychnine thus obtained was calculated as the sulphate. Any deviation from the pure salt was taken into consideration in all subsequent determinations.

In order to obtain an idea of the amount of strychnine sulphate adsorbed by the filter paper used in the process, a series of blank determinations was run, the charcoal being omitted. The other details of the procedure were identical. The results obtained showed such small deviations from no adsorption that any loss due to this factor was neglected.

¹ This article is based on a dissertation by R V Rice presented in partial fulfillment of the degree of Master of Science at the University of Montana, 1934.

² Professor of Pharmacy University of Montana

DISCUSSION

I Solvent—Water Time—24 Hours—Seven different charcoals and Lloyd's Reagent were used in this investigation Charcoals designated by number are activated forms sold on the market to-day

By plotting the original concentration of strychnine sulphate against the amount adsorbed per Gm of charcoal, an isotherm was obtained in each case as is shown in Figs 1 and 2 which represent the adsorption efficiency

Charcoal No 1 proved by far the best adsorbent of the group, adsorption being complete up to a concentration of nearly 5 Gm per L None of the other charcoals used showed total adsorption beyond concentrations of 2 Gm per L On the other hand, willow charcoal (Curve No 7), the type used in most pharmaceutical operations, proved by far the poorest adsorbent of the group, taking up only 11 per cent of the salt when the original concentration was but 1 Gm per L

Bone black (Curve No 6) showed a surprisingly high adsorbing power Like the willow charcoal there was no finite concentration at which total adsorption took place, but the percentage of adsorption dropped much less rapidly with increasing concentrations

The other carbons used proved intermediate in their affinity for the alkaloidal salt No 2 and No 4 gave total adsorption in concentrations to almost 2 Gm per L, while No 3 and No 5 adsorbed completely up to about 1 Gm per L Lloyd's Reagent (Curve No 8) also proved an intermediate adsorbent but differed from the others in that the percentage adsorbed at higher concentrations fell much less rapidly

In order to make a direct comparison of the adsorption efficiency of each charcoal in the different concentrations, the results were tabulated to show the per cent of strychnine sulphate adsorbed These results are shown in Table I

TABLE I—PER CENT OF STRYCHNINE SULPHATE ADSORBED

Adsorbent	1	2	3	4	5	6	7	8	10	12
Charcoal No 1	100	100	100	100	97.7	89.0	77.9	69.0	56.1	47.1
Charcoal No 2	100	94.5	76.3	62.6	52.0	44.2	38.9	34.4	28.8	25.9
Charcoal No 3	100	95.5	80.4	69.3	60.1	51.7	44.7	39.2	31.5	26.4
Charcoal No 4	100	89.0	66.3	51.9	41.9	35.2	30.3	26.5	21.7	18.5
Charcoal No 5	94.0	75.6	63.3	54.5	48.0	42.8	38.4	34.6	28.6	24.0
Bone black	36.3	36.0	35.4	34.7	33.5	31.7	29.8	27.9	24.7	21.6
Lloyd's Reagent	100	83.2	75.4	65.2	55.5	49.0	43.7	39.3	33.2	28.3
Willow charcoal	11.0	10.3	10.0	7.8	6.3	5.3	4.5	3.8	3.2	2.6

II Langmuir's Equation—Langmuir's equation for the expression of adsorption isotherms has been found in most cases to hold more nearly true over wider ranges of concentration than does Freundlich's equation (2)

These equations are

1 Langmuir's equation, $\frac{C}{Q} = \frac{1}{ab} + \frac{C}{b}$, where C is the original concentration, Q is the quantity adsorbed and a and b are constants

2 Freundlich's equation, $\left(\frac{x}{m}\right)^n = kc$, where x is the amount adsorbed, m is the weight of adsorbent and c is the original concentration, k and n being constants

By plotting logarithms of the values of x/m against c of Freundlich's equation a straight line results if the original curve obtained by plotting v/m against c proves

Fig 1

Fig 3

Fig 4

Fig 2

Fig 5

to be a parabola (3) As can be seen by inspection of the isotherms of Figs 1 and 2, none of these curves is by any means perfect parabolas, hence Freundlich's equation is not suitable for the expression of these isotherms

On the other hand the plotting of C/Q against C of Langmuir's equation gives a near straight line in most of the cases tried. The plots of these values are shown in Figs 3 and 4. It was found that the sample of willow charcoal used yielded such extremely high values for C/Q that plotting of its curve in these figures was impossible. The large variation also obtained in the values of C/Q indicates that this equation does not represent the isotherm very satisfactorily. All the other curves conform quite well to the equation as shown by the figures (see Figs 3 and 4. Curve 6—bone black, Curve 8—Lloyd's Reagent)

TABLE II—CONSTANTS OF LANGMUIR'S EQUATION

Charcoal	<i>a</i>	<i>b</i>
No 1	1 154	0 610
No 2	0 144	0 336
No 3	1 969	0 231
No 4	0 329	0 483
No 5	0 318	0 393
Bone black	0 062	0 734
Lloyd's Reagent	0 455	0 400

The constants a and b of Langmuir's equation were calculated for each carbon by plotting the curves of Figs 3 and 4 on quite a large scale in order to obtain the slope of the lines and their Y-intercepts more accurately. These values are shown in Table II.

III Solvent—Water Time—48 Hours—The same procedure employed in the preceding 24-hour determinations was followed in this case, with the exception that the period of contact was prolonged to 48 hours. Isotherms were determined for Charcoal No 1 and Charcoal No 3.

Charcoal No 1 gave an isotherm identical with the one obtained in the shorter period of contact. This means that equilibrium must have been reached between the adsorbent and the strychnine sulphate solution within 24 hours of contact and this equilibrium was permanent for at least an additional 24 hours.

Charcoal No 3 on the other hand adsorbed more alkaloid when left in contact with the solution for 48 hours than it did in the shorter period of time. The results indicate that it takes more than 24 hours for Char-

Fig 6

coal No 3 and strychnine sulphate solution to reach adsorption equilibrium. The 48-hour curve in this instance probably represents the equilibrium but no determina-

tion involving a longer period of time was run to prove this presumption Curve 1 of Fig 5 is the 48-hour isotherm while Curve 2 is the result obtained in the shorter period of contact

IV Solvent—Alcohol Time—24 Hours—The amount of adsorption is

dependent upon the surface tension of the solvent (4), hence the use of alcohol in place of water should give a different isotherm when all the other factors are constant

The effects of such a change were determined in the cases of Charcoals No 1 and No 2, using commercial alcohol sp gr 0.810 at 26° C which corresponds to about 94 per cent by volume

Figure 6 shows the results secured by use of Charcoal No 1, Curve 1 with alcohol and Curve 2 with water A marked drop in adsorption is evidenced in the alcohol solution, showing total adsorption to a concentration of only 1.5 Gm per

Fig 7

L of alkaloidal salt The alcohol curve also shows a maximum of adsorption at about 9 Gm per L concentration, whereas the water curve rises slowly but steadily upward after the usual sharp bend Table III gives a direct comparison of the amounts adsorbed in each case

TABLE III—PER CENT ADSORBED BY CHARCOAL No 1

Solvent	Concentration—Gm per L.									
	1	2	3	4	5	6	7	8	10	
Water	100	100	100	100	97.7	89.0	77.9	69.0	56.1	
Alcohol	100	95.2	90.9	86.2	78.1	68.2	59.9	53.3	42.6	

Charcoal No 2 with alcohol (Fig 7, Curve 1), shows the same type of diminution in adsorption as does Charcoal No 1 The highest point of total adsorption occurs at a concentration of about 1 Gm per L This point is somewhat lower than that of Charcoal No 1 and the maximum of the curve occurs at about 6 Gm per L concentration in contrast to 9 Gm per L concentration in the case of Charcoal No 1 Table IV presents a direct comparison of quantities adsorbed at different concentrations in the two solvents

TABLE IV—PER CENT ADSORBED BY CHARCOAL No 2

Solvent	Concentration—Gm per L.								
	1	2	3	4	5	6	7	8	10
Water	100	94.5	76.3	62.6	52.0	44.2	38.9	34.4	28.8
Alcohol	100	78.0	61.5	50.3	42.5	35.7	30.4	25.3	20.2

SUMMARY

- 1 The media studied vary widely in their ability to adsorb strychnine sulphate
- 2 One charcoal was found to require more than 24 hours to reach an equilibrium of adsorption

3 Langmuir's equation represents the adsorption curves better than does Freundlich's equation

4 The ability of Charcoals No 1 and No 2 to adsorb strychnine sulphate from solution is less when the salt is dissolved in alcohol than when it is dissolved in water

THE STABILIZATION OF SOLUTION OF IRON AND AMMONIUM ACETATE, U S P X¹

BY WILLIAM J HUSA² AND LYELL J KLOTZ

Husa and Birmingham (1) found that the stability of Solution of Iron and Ammonium Acetate is affected by various factors such as light, heat and variations in the proportions of the ingredients. In the present investigation, further experimentation was undertaken with a view toward increasing the stability of Solution of Iron and Ammonium Acetate, commonly known as Basham's Mixture

Order of Mixing—In the preparation of colloidal solutions, the order of mixing is often an important factor in the stability of the finished product, particularly when substances capable of acting as protective colloids are present. Birmingham (2) prepared Basham's Mixture by 12 different orders of mixing and stored the resulting preparations under three conditions, *i e*, sunlight, darkness and diffused light. Order of mixing appeared to have no effect upon the stability, except in a few cases of diffused light.

Since the tests carried out by Birmingham in diffused light gave some indication that order of mixing might be a factor to consider, further tests were carried out on this point. The materials used were of U S P grade, the ammonium carbonate assaying 31.2% ammonia and the diluted acetic acid being adjusted to 6.0%. Solutions were prepared by two methods: (a) hand mixing, shaking well after the addition of each ingredient, and (b) mechanical mixing, adding each ingredient drop by drop from a burette into a beaker fitted with an electric stirrer, five minutes being allowed after the final addition of each ingredient and efficient mechanical stirring being maintained throughout the process.

In order to designate the orders of mixing concisely, the following numbers are assigned to the various ingredients:

- | | |
|--------------------------------|-------------------|
| 1 Solution of Ammonium Acetate | 4 Aromatic Elixir |
| 2 Diluted Acetic Acid | 5 Glycerin |
| 3 Tincture of Ferric Chloride | 6 Water |

¹ Section on Practical Pharmacy and Dispensing, A. P. H. A., Washington meeting, 1934

² Head Professor of Pharmacy, University of Florida

The orders of mixing were as follows, certain ingredients being omitted in some cases as indicated

MECHANICAL AGITATION

1 + 2 + 3 + 4 + 5 + 6, 3 + 5 + 4 + 1 + 2 + 6, 3 + 5 + 4 + 2 + 1 + 6, 3 + 5 + 2 + 1 + 4 + 6, 3 + 5 + 1 + 2 + 4 + 6, 3 + 1 + 2 + 5 + 4 + 6, 1 + 5 + 3 + 2 + 4 + 6, 1 + 3 + 2 + 5 + 4 + 6, 1 + 2 + 5 + 4 + 3 + 6, 3 + 4 + 1 + 2 + 5 + 6, 3 + 4 + 2 + 1 + 5 + 6, 1 + 3 + 4 + 5 + 6 (2 omitted), 1 + 3 + 5 + 4 + 6

HAND AGITATION

1 + 2 + 3 + 4 + 5 + 6, 1 + 3 + 5 + 4 + 6 (2 omitted)

The solutions were stored under various conditions, 25-cc portions being placed in 1-oz prescription bottles. The solutions were observed daily for evidences of precipitation.

TABLE I—THE EFFECT OF VARIOUS CONCENTRATIONS OF DILUTED ACETIC ACID ON THE STABILITY OF SOLUTION IRON AND AMMONIUM ACETATE

Diluted Acetic Acid	Time of Ppt. Days	Diluted Acetic Acid	Time of Ppt., Days
0% (s)	9	8% (s)	19
0%	9	8%	19
2% (s)	11	12% (s)	51
2%	11	12%	52
4% (s)	11	18% (s)	*
4%	11	18%	*
6% (s)	14		
6%	14		

* Did not precipitate during the test period of 60 days

Mechanically mixed samples following the U S P X order of mixing precipitated in 22 days in diffused light and in 29 days in darkness, hand-mixed samples precipitated after practically the same interval. The samples prepared by various other orders of mixing precipitated in 13 to 26 days in diffused light and in 18 to 31 days in darkness. Since differences of a few days might be attributed to experimental error and in any case would not be of much practical significance, it may be safely concluded that the variations in order of mixing showed no advantage over the U S P method. It is further evident that mechanical mixing offers no advantage over hand mixing as far as stability is concerned. Samples of all the above solutions were also stored in a refrigerator at about 6° C, after 18 months, all the samples were still perfectly free from precipitation. It is thus apparent that storage of the solution at refrigerator temperature constitutes an excellent method of avoiding the troublesome deterioration.

Effect of Various Concentrations of Acetic Acid—Samples of Solution of Iron and Ammonium Acetate were prepared containing 0%, 2%, 4%, 6%, 8%, 12% and 18% of Diluted Acetic Acid in the finished preparation. Two 30-cc portions of each sample were placed in 4-oz prescription bottles in diffused light. One sample was shaken daily and the other allowed to remain undisturbed. Table I shows the time of precipitation of these solutions. Samples marked (s) were shaken daily.

It was concluded from the data in Table I, that the time of precipitation is inversely proportional to the quantity of acetic acid present, and that daily agitation has no effect upon the time of precipitate formation

Effect of Addition of Alkali—Specified quantities of a normal solution of sodium hydroxide were added to samples of Solution of Iron and Ammonium Acetate before diluting the mixture to volume with distilled water. Samples were stored in diffused light. Data are shown in Table II.

TABLE II—THE EFFECT OF ADDITION OF ALKALI UPON THE STABILITY OF SOLUTION OF IRON AND AMMONIUM ACETATE

N Alkali in Solution	Time of Ppt., Days	N Alkali in Solution	Time of Ppt. Days
0.5% (s)	7	5.0% (s)	9-27*
0.5%	7	5.0%	10-29*
1.0% (s)	6	10.0% (s)	**
1.0%	6	10.0%	**
2.0% (s)	5		
2.0%	7		

* Precipitated at the end of 9 and 10 days, respectively, the precipitate redissolved within a few hours and did not reappear until the expiration of 27 and 29 days, respectively.

** Did not precipitate during the test period of 60 days.

It was concluded from the data in Table II, that additions of alkali in concentrations of 5% or more of normal solution exert a stabilizing influence upon this preparation. This observation is in accord with theory in that it is well known that ferric hydroxide is more readily peptized in neutral or alkaline than in acid media (3).

Effect of Concentration of Ingredients—Husa and Birmingham (1) have shown that an increase in the concentration of certain ingredients resulted in increased stability of Solution of Iron and Ammonium Acetate. Walter Taylor (4) stated that a double strength preparation is stable, his statement being based upon the U. S. P. formula of 1890. Although the present U. S. P. formula cannot be doubled in strength by the use of the ingredients contained, it is possible to perform the concentration by substituting the proper amount of acetic acid or glacial acetic acid for the required quantity of Diluted Acetic Acid.

In order to determine the stability of a preparation made exactly twice as strong as the present official solution, samples of solution were prepared according to the following formula:

Solution of Iron and Ammonium Acetate

Tincture of Ferric Chloride	80 cc
Glacial Acetic Acid	65 cc
Ammonium Carbonate	50 Gm
Aromatic Elixir	240 cc
Glycerin	240 cc
Distilled Water, q. s.	1000 cc

Mix the glacial acetic acid with 350 cc of distilled water and to this mixture gradually add the ammonium carbonate. After effervescence has ceased, add successively, the tincture of ferric chloride, the aromatic elixir, and the glycerin, and lastly, enough distilled water to make the product measure 1000 cc.

This solution was then stored under the usual conditions in 1-oz prescription bottles, portions of the solutions also being placed in the electric oven at approximately 50° C. In addition, 8-oz bottles of the concentrated preparation were stored under the usual conditions and at the end of each month, 1 fl oz of the concentrate was diluted with an equal volume of distilled water and stored for comparison with a control sample. Data follow in Table III.

TABLE III—THE EFFECT OF DOUBLING THE CONCENTRATION OF ALL INGREDIENTS IN SOLUTION OF IRON AND AMMONIUM ACETATE

Sample	Sunlight.	No. of Days before Ppt Occurred		Oven
		Diffused Light.	Darkness	
U S P Control	5	55	60	1
Concentrate	26	No ppt 6 months	No ppt 6 months	10

In addition, samples prepared by diluting the concentrate were fully as stable as freshly prepared control specimens, no difference being observed in any case between the times of precipitation.

It was concluded from the data in Table III, that a stable preparation can be prepared by doubling the quantities of active ingredients in Solution of Iron and Ammonium Acetate.

SUMMARY

1 The deterioration of Basham's Mixture may be avoided by storing the solution at refrigerator temperature.

2 Basham's Mixture is very stable when prepared double strength, this concentrated preparation may be diluted to double its volume with distilled water just before it is dispensed.

3 The stability of Basham's Mixture may be improved by increasing the proportion of acetic acid or by the addition of alkali, but since these changes would alter the product somewhat, they are not considered as practical as the methods listed under 1 and 2.

ANALYSIS OF MAGNESIUM CARBONATE *

BY HAROLD R. BOWERS ¹

Samples of Magnesium Carbonate were obtained from eight sources. These were subjected to routine analysis to discover how closely they compared, particularly as to MgO content and to find out how wide a range existed. Also to

* Section on Practical Pharmacy and Dispensing, A. Ph. A. Washington meeting 1934

¹ Assistant Professor of Pharmacy, University of Southern California College of Pharmacy
Los Angeles Calif

discover if the various samples conformed to the U S P requirement as to limit of CaO The results of the analysis are given in the following table

TABLE I

Samples	% MgO	% CO ₂	% H ₂ O	% Al and Fe.		% CaO
1	41 89	29 70	27 52	T	T	0 51
2	46 90	39 50	12 00	T	T	0 58
3	46 90	36 30	16 00	T	T	0 50
4	42 08	35 50	22 10	T	T	0 16
5	43 90	35 80	20 00	T	T	0 01
6	48 50	39 60	11 20	T	T	0 42
7	41 80	36 95	20 12	T	T	0 43
8	48 35	36 44	14 30	T	T	0 41

As shown in Table I, the samples analyzed have an MgO content ranging from 41 80% to 48 50% while the CaO content for all samples is well within the limit (0 80%) set by the U S P X The Al and Fe contents are negligible

The foregoing results are of interest and importance when we consider the U S P X formula for Solution of Magnesium Citrate

Magnesium Carbonate	15 00 Gm
Citric Acid	35 00 Gm
Syrup	60 00 cc
Purified Talc	5 00 Gm
Oil of Lemon	0 10 cc
Potassium Bicarbonate	2 50 Gm
or, Sodium Bicarbonate	2 10 Gm
Distilled Water, a sufficient quantity to make	350 00 cc

On the basis of the following equations we can compute the quantity of Citric Acid to be used in the preparation of Solution of Magnesium Citrate, assuming that we wish to obtain $\text{MgHC}_6\text{H}_5\text{O}_7$ as the active agent in the finished solution

Thus, by using the calculated factors the amount of Citric Acid necessary for a given sample of Magnesium Carbonate can easily be computed

$$\begin{aligned} \text{(A)} \quad & \frac{210 \ 11}{40 \ 32} = 5 \ 2110 \text{ factor for MgO} \\ \text{(B)} \quad & \frac{210 \ 11}{200 \ 22} = 1 \ 0493 \text{ factor for KHCO}_3 \\ \text{(C)} \quad & \frac{210 \ 11}{168 \ 02} = 1 \ 2505 \text{ factor for NaHCO}_3 \end{aligned}$$

EXAMPLE For a Magnesium Carbonate of 48 5% MgO content
 $15 \times 0 \ 485 \times 5 \ 211 = 37 \ 91 \text{ Gm } \text{H}_3\text{C}_6\text{H}_5\text{O}_7 \cdot \text{H}_2\text{O}$ is required

The following table shows the results of similar calculations applied to all samples analyzed, also the total amount of $\text{H}_3\text{C}_6\text{H}_5\text{O}_7 \cdot \text{H}_2\text{O}$ required for both Magnesium Carbonate and NaHCO_3 or KHCO_3 The amount necessary for the latter two substances is, of course, a constant, $2 \ 62 \text{ Gm}$

TABLE II

Sample No	Amount of $\text{H}_3\text{C}_6\text{H}_5\text{O}_7 \cdot \text{H}_2\text{O}$ for Magnesium Carbonate Gm	Amount $\text{H}_3\text{C}_6\text{H}_5\text{O}_7 \cdot \text{H}_2\text{O}$ Required for Either KHCO_3 or NaHCO_3 Gm	Total Amount Required Gm
1	32 74	2 62	35 36
2	36 66	2 62	39 28
3	36 66	2 62	39 28
4	32 89	2 62	35 51
5	34 31	2 62	36 93
6	37 91	2 62	40 53
7	32 67	2 62	35 29
8	37 79	2 62	40 41

Table II reveals (a) that for all of the samples analyzed the amount of Citric Acid in the U S P formula is insufficient, assuming, of course, that $\text{MgH}_2\text{C}_6\text{H}_5\text{O}_7$ and either $\text{K}_2\text{HC}_6\text{H}_5\text{O}_7$ or $\text{Na}_2\text{HC}_6\text{H}_5\text{O}_7$ are desired as reaction products, (b) that in some cases, i e (2, 3, 6 and 8), the insufficiency is quite appreciable

The results also assume NaHCO_3 and KHCO_3 as 100% pure, which, of course, is not true The totals are, therefore, close approximations No provision has been made for the slight amount of CaO

It would seem then that the formula for Solution of Magnesium Citrate should be more flexible, i e, provide for varying proportions of Citric Acid proportional to the MgO content of the Magnesium Carbonate used

It is well known that Solution of Magnesium Citrate precipitates upon standing As one chemist recently stated, "Some batches have stood up for three years, others have precipitated in three weeks"

Pasteurization at 60°C for one hour retards precipitation, but does not prevent it Possibly better dispersion is thus effected

It is logical to believe that when Magnesium Carbonate, high in MgO is used, precipitation will take place more quickly and in greater quantity

It would be good Pharmacy to first analyze the Magnesium Carbonate, calculate the amount of $\text{H}_3\text{C}_6\text{H}_5\text{O}_7 \cdot \text{H}_2\text{O}$ necessary, and then *q s* to a volume such that the preparation will contain just slightly more than 1.5 Gm MgO per 100 cc

A product more uniform from the standpoint of chemical composition (qualitatively and quantitatively) and physiological action would thus be obtained

A SUGGESTED FORMULA FOR WHITE LINIMENT *

BY LAWRENCE H. BALDINGER

From time to time different formulas have appeared in the pharmacy journals for a product known commonly as *White Liniment* This liniment should not be confused with *Limentum Terebinthinæ Aceticum*, *N F V*, known also as *Limentum Album* The *White Liniments* being manufactured by a number of pharmaceutical houses at present appear to be stable emulsions of fixed oils in which suitable stimulants and rubefacients have been dissolved

White Liniment is often prepared extemporaneously by the pharmacist according to the following formula

* Section on Practical Pharmacy and Dispensing, Washington meeting, 1934

Ammonia Water

Olive Oil

Oil of Turpentine, ññ , *aequales partes*

The resulting product, however, separates on standing, especially if the olive oil is neutral, and it has been suggested (1) that two drachms of oleic acid be added to make a non-separable mixture, and that camphor or opium may be added to enhance the value of the liniment. Newman (2) has suggested a similar formula in which neatsfoot and cottonseed oils have been substituted for olive oil. Other formulas (3), (4), (5), (6) which are more suitable in the preparation of a stock *White Liniment* include the following ingredients in varying amounts: ammonium carbonate, camphor, oil of turpentine, oil of origanum, castile soap, soft soap, cottonseed oil and alcohol.

In the preparation of *Ammonia Liniment*, *N F V*, which, for all practical purposes, is a *White Liniment* without some of the rubefacient ingredients, several suggestions have been made to insure a homogeneous and permanent emulsion of creamy consistency. Raubenheimer's suggestions (7) have been adopted in part by the *N F V* Revision Committee in that sesame oil is used in *Ammonia Liniment*. Latham (8) has proposed the use of paraffin oil, oleic acid and ammonia water as ingredients for *Ammonia Liniment*.

White Liniment is essentially an oil-in-water emulsion, the emulsification being brought about by a small amount of ammonium soap in the mixture. This soap is either added as such or is produced in the mixture by a reaction between the ammonia water and some fatty acid present in the fixed oil. It is thus apparent, as pointed out by Kyser and Velbrandt (9), that a stable emulsion cannot be formed if the fixed oil is neutral or if no soap is added. These authors have stated that as the percentage of fatty acid increases up to a certain point, the emulsion improves, but becomes too viscous when the fatty acid content is high. They have recommended that fixed oils should be standardized with respect to percentage of free fatty acids. Shulze (10) has also stated from observation that some free fatty acid in oils appears to be necessary for the preparation of emulsions.

The "whiteness" of *White Liniment* is dependent upon the saponified fat present in the preparation, and upon the minuteness of the oil globules dispersed in the oil phase. Without the use of a colloid mill or a homogenizer, it would be difficult to make a permanent, non-separating liniment. It has been suggested (7), (11) that sufficient alcohol be added to reduce the density of the outer phase to that of the oil phase, or to use glycerin for increasing the viscosity of the emulsion. Neither suggestion seems to have been adopted.

A few years ago, the Carbide and Carbon Chemicals Corporation (12) introduced a new synthetic organic chemical, triethanolamine. The commercial product is a colorless liquid of faintly ammoniacal odor and great hygroscopicity. It is less alkaline than ammonia, not harmful to textiles, not caustic to the skin. Recently the Council on Pharmacy and Chemistry of the American Medical Association (13) accepted for admission to New and Nonofficial Remedies triethanolamine-crude. The report of the Council in part is as follows:

"Triethanolamine-crude is an excellent emulsifying agent for use in the preparation of ointments and other dermatologic medicaments. It combines with fatty acids to form soaps with

good detergent properties, which are soluble not only in water but also in gasoline, kerosene and oils. It is claimed to have the power of increasing the penetration of oily substances and to possess a certain amount of bacteriostatic action."

For the preparation of *White Liniment* the following formula was used. The amount of stimulants and rubifacients may be varied to suit the compounder.

WHITE LINIMENT

Cottonseed Oil	220 Gm
Oleic Acid	25 Gm
Triethanolamine	5 Gm
Camphor	9 Gm
Oil of Turpentine	40 cc
Stronger Ammonia Water	25 cc
Distilled Water <i>q s ad</i>	500 cc

To the cottonseed oil, in which is dissolved the camphor, add the oleic acid and triethanolamine, and stir vigorously, preferably with a motor stirrer. Add the oil of turpentine and continue stirring until the mixture is homogeneous. Then slowly add with constant stirring about one half the required amount of water. Stir until a thick creamy emulsion is formed. Add the stronger ammonia water and enough distilled water to complete the required volume.

This product may show a tendency to separate, particularly if diluted to a high degree with water. The product, however, can be restored to the original state by gentle shaking.

In an attempt to simplify the preparation of this product in small quantities the formula and procedure were modified slightly as follows. The camphor and cottonseed oil were replaced by an equal weight of *Camphor Liniment U S P*, and the ingredients were placed in a dry bottle and vigorously shaken to form the emulsion. The resulting product indicated that the bottle method is to be preferred in the preparation of smaller amounts of liniment.

CONCLUSION

1. Triethanolamine-crude, N N R, has been suggested as an emulsifying agent in the preparation of *White Liniment*.

2. Both the stirrer method and the bottle method have been proposed for making this emulsion.

UNIVERSITY OF NOTRE DAME,
DEPARTMENT OF PHARMACY, NOTRE DAME, INDIANA

A NOTE ON OPEN PRESCRIPTION DEPARTMENTS *

J NORMAN SILSBY ¹

The present trend toward visible prescription departments is perhaps one of the most hopeful signs of the reawakening of Pharmacy's professional pride. It is beginning to realize that it has professional obligations to itself as well as to the physician and his patient.

Pharmacists are beginning to realize that a more professional atmosphere in the store goes far toward increasing his prestige and business.

It is hoped that the trend toward the visible prescription department becomes more wide-spread, but it is a move that must be considered carefully before it is undertaken.

As no two locations are identical the pharmacist must make his own decisions as to the probable advantages to be derived from an open department. The following are a few of the things he may do well to consider before making his decision.

As the primary object of the drug store is the filling of doctor's prescriptions, the opinion of the local physicians should be sought and their suggestions given serious thought. The good-will of the physician is one of the most potent factors in building a remunerative prescription practice and every effort should be made to secure his cooperation.

With this object in view the writer interviewed a number of our local physicians and they have been unanimous in their disapproval of a department in which it was possible to see the different ingredients that enter in the finished prescription.

At this point it would be well to add a word about the meaning of the term "visible prescription department." As the writer understands the term it means a department where the customer can see the top of the work-bench on which the prescription is being prepared and is able to follow every move the pharmacist makes and see the different ingredients that go to fill the prescription. Of course if the department is one in which the customer can only see the head and shoulders of the pharmacist, the following objections do not hold.

In the recent "Prescription Ingredient Survey" a tabulation of the number of ingredients in the average prescription showed that between 41.4% and 46.8% of all prescriptions studied contained only one ingredient and from 60% to 72.7% had no more than two ingredients. The average for all prescriptions studied was 2.29%.

It can readily be seen from this report that the filling of the greater number of prescriptions consists chiefly of pouring from one bottle to another, or possibly adding a salt to a liquid or mixing two liquids. Of course the care and ability necessary in compounding the ingredients in the first place does not enter into the consideration of the customer when he sees the actual filling of the prescription. Unless the patron understands this the natural reaction of the customer will be one of resentment toward the prescriber for giving him a prescription so simple in its ultimate composition. The fact that the customer can see the ingredients in his prescription is the chief objection of the doctor. The next objection presented by the doctors was the tendency toward self-medication.

Another point that must be considered is that if the prescription calls for "a

* Section on Practical Pharmacy and Dispensing, A. Ph. A., Washington meeting, 1935.

¹ Rutgers University School of Pharmacy, Newark, N. J.

poison" to be used internally and the customer sees the label, it may engender an unwarranted fear in his mind—for to him "a poison" is a poison in any quantity

Then again, every pharmacist has had the experience of a prescription "going wrong" and being forced to throw it away and start over again. To the initiated this has no particular significance but to the patient it may mean that the pharmacist was either lacking in ability or was careless in his work.

Of course, all of these factors may not enter into the consideration of those contemplating a change but the writer thinks they will all be well repaid if they interview their local physicians and give the other points careful thought before they make any changes. In the larger stores, where the prescriptions are received at a desk and the customer is unable to identify his own prescription in process of being dispensed, none of these objections may be serious.

As an alternative to the visible prescription department the writer offers the suggestion of a visible manufacturing department where the pharmacist can make up his pharmaceuticals. Seeing a pharmacist making one of the various types of pharmaceuticals would show the patron that there is more to pharmacy than selling stamps or wrapping packages.

THE PROFESSIONAL OUTLOOK *

BY L M KANTNER

Several months ago, a gentleman who is deeply interested in professional pharmacy asked my opinion regarding the future of pharmacy. In reply I asked for his opinion on the subject. Rather dolefully we both shook our heads.

Somehow I am led to believe that the public appreciation of pharmacy has slumped. We can remember the long rows of glass-stoppered and glass-labeled bottles that were first encountered upon entering the drug store of a generation ago. The public really had a high appreciation of the professional phases of pharmacy in those days. The stores themselves seemed to radiate confidence, respectability and balance.

The change in the public reaction and the change in the drug stores are almost incredible when contrasted with the advances made in pharmacy as a whole. The educational system has made vast improvement. In earlier days, there were no legal requirements for pharmaceutical practice. Later, a specified number of years of experience was required in addition to passing a state board examination. High school training and college of pharmacy graduation came in due course. Finally, the college course has been increased from two years to four. In my opinion it can be truthfully said that pharmaceutical education is on a standard collegiate basis.

These magnificent advances came in response to the efforts of those who appreciated and understood the importance of pharmacy and the need for placing it on a sound educational foundation. It was accepted that to become a fully recognized profession sound educational training must be made a basic requirement.

Later, there developed another class of individuals who saw an opportunity to commercialize the advances pharmacy was making professionally. A deliberate

* Section on Practical Pharmacy and Dispensing, A. P. H. A. Washington meeting, 1934

effort was made to exploit the standing of the drug store Pharmacy became the object of a heartless and ruthless attack

The dignified and thought-provoking shelf bottles gave way, in some stores, to bric-a-brac, cooking utensils, gardening tools, athletic supplies, canned foods, hardware and recently, hard liquor The soda fountain has developed a lunch and dinner service, carried on in the name of pharmacy

A few days ago a prominent woman said to me that the modern drug store was a most pitiful institution The conglomerate assortment of merchandise gives the store a hodge-podge location in the public mind It is difficult to think of professional practice in a lunch-room atmosphere One is not inclined to place a high estimate on persons who seem determined to place a low value on themselves There is no difficulty in understanding the public mind—it is an unavoidable reflection of the course of action followed by thousands of retail pharmacists

There is, however, no question that we have many high type drug stores, perhaps more than ever before These stores are conducted on an ethical basis, and by persons devoted to high professional principles Such stores are a credit to pharmacy, and are efficient in every respect

Some may claim that the professional and ethical type of pharmacy is not affected by the general merchandising type, that the higher the professional standing the less the store is concerned with purely commercial matters In my opinion this view is utterly unsound In the first place, no drug store, however professional it may be, can operate in an uneconomic style The general merchandising store really sets the pace They sell thousands of items, running into fabulous sums, in direct competition with the ethical store Many of these items are used as "loss leaders" with the result that every one must compete on the same basis or be out of the picture Many of the best selling preparations have been footballed so long that there is no price other than the predatory price This list includes antiseptics, toilet preparations, cod liver oil, mineral oils, chemicals, pharmaceuticals, articles for feminine hygiene and countless other items These general merchandising stores buy these articles frequently in enormous quantities, cut them to a predatory level and thus establish the conditions under which they are sold This state of affairs is largely responsible for the general public estimate that the present-day pharmacist is just another merchant

While the writer is inclined to judge the future for pharmacy as anything but bright, he believes that the near future will see more professional pharmacies and better pharmaceutical service will be extended the public There are several reasons for this The codes have attacked some unfair trade practices, and common-sense has raised the current level of many articles heretofore sold on a predatory basis Pharmaceutical legislation of the future is certain to be more aggressive The boards of pharmacy should be clothed with discretion when applications are made for new drug stores The sale of drugs and medicines should be restricted to pharmacists, and drug stores should conform their activities and classes of sales to reasonable limitations

My optimism is based upon my inherent feeling that pharmacy is an essential and responsible public health profession Will the public save it, if we fail to do so?

COOPERATION BETWEEN DENTISTS AND PHARMACISTS *

BY SAMUEL M GORDON ¹

Dentistry and pharmacy have a common purpose in caring for the public health. This may have been overlooked, probably because of the emphasis that has been given in the past to the restorative aspects of dentistry and because of certain trends in pharmacy, notably the stocking of many shelves with diverse nostrums. The present trend in dentistry is toward prevention, just as we are aware that there is a return to the professional prescription pharmacy, where the nostrum is not permitted to enter. To be sure, the operative and prosthetic aspects of dentistry will continue to absorb a large part of dental effort, even as orthopedic surgery, to choose but one example from the field of medicine, has not been entirely displaced by the new knowledge of nutrition.

The dental curriculum of to-day emphasizes the relationships of physiology, bacteriology, pathology, biochemistry and other basic sciences to the prevention and treatment of dental disease. The study of the action and uses of drugs occupies a fair proportion of the dental curriculum.

Drugs have been used for correcting and alleviating dental disorders from earliest times. Reference to the use of drugs for the relief of toothache is found in the earliest manuscripts. Drugs were used in the attempt to control dental caries in the earliest practice of dentistry. Large amounts of plant and mineral astringents were used in the treatment of diseases of the gums. The dental profession is associated with the discovery of the anesthetic properties of ether and nitrous oxide, through Morton and Wells. Dentists were instrumental in large measure for examining clinically the local anesthetic properties of cocaine and the numerous synthetics related to it. It is estimated that the greater part of all the procaine, and a large amount of epinephrine, manufactured, is now used by dentists.

Dental surgeons treat pathological conditions of the soft and hard tissues of the oral cavity and closely adjacent areas. In the practice of oral surgery and in the routine practice of dentistry, large amounts of general and local anesthetic agents, germicides, analgesics, hypnotics, hemostatics and other classes of drugs are used.

With the appreciation that dental caries is related in some way to the problem of calcium supply and deposition, the dentist prescribes and is being urged to recommend preparations containing calcium and phosphorus, as well as various vitamin containing preparations ². One cannot speak of calcification or the laying down of bone, dentine or enamel, without at least mentioning the endocrine system, and particularly the parathyroid and its function in calcium deposition. Investigations on record, confirmed and unconfirmed, point to an interplay of other glandular secretions ³.

* Section on Education and Legislation, A. P. H. A., Washington meeting, 1934.

¹ Secretary, Council on Dental Therapeutics of the American Dental Association.

² "Diet and the Teeth," Report of the Council on Dental Therapeutics, *J. A. D. A.*, 19, 1843 (October 1932).

³ "Endocrines and Teeth," Report of the Council on Dental Therapeutics, *Ibid.*, 21, 322 (February 1934).

These points are cited to illustrate the classes of drugs that dentists may be called upon to prescribe, recommend or to advise upon. As far as I am aware from the various state dental practice acts, there are no restrictions on the prescribing or uses of drugs by dentists, other than those that apply to physicians of the regular schools.

Many *clinical* samples are sent to dentists by manufacturers of all kinds, good and bad. The purpose behind the generosity is palpable. The senders do not expect a clinical test in the fine sense of that term. Is it not reasonable to expect that they hope the package will be used and displayed in such a way that the patient remembers the name after he leaves the office, so that it may be purchased without the immediate advice of his medical adviser for similar or other conditions that may arise after his office visit? Here the drug stores also assume part of the blame for counter prescribing.

Contrary, undoubtedly, to the desire of the manufacturers of some pernicious proprietary articles, who would have the dentist serve as his advertising agent, it is gratifying to know that since the inception of the Bureau of Chemistry and the Council on Dental Therapeutics of the American Dental Association, the dental profession by far and large, are protesting these evil practices and supporting the interests of legitimate therapy, as exposed in the reports of the Council which have been appearing in the *Journal of the American Dental Association* in the past five years.

The Council on Dental Therapeutics has been pointing out to dentists the imposition practiced on them and on their patients by patent medicine exploiters parading in the more respectable guise of medicine manufacturers. It need surprise no one acquainted with the work of the Council on Pharmacy and Chemistry that similar conditions exist in the dental profession. Here are just a few of the findings. Two-thirds of a fluidounce of a pyorrhea cure, which sold for ten dollars, was found to be forty per cent sulphuric acid. Another guaranteed cure for pyorrhea, bleeding gums and all the other indefinite expressions linked in the exploiter's literature, under the term pyorrhea, sold for ten dollars for a half pound. This contained pumice, 90 per cent, and alum, 10 per cent. A tablet under the name of Anacin, which, on the whole was a variation of the well-known A P C mixture, was sold through the unwitting advertising of dentists who accepted and passed out the "clinical" samples. The "newest local anesthetic" was found to be a mixture of benzyl alcohol and chloroform. Neu-Ora claimed to be a non-toxic topical anesthetic was found to contain 15 per cent of cocaine. Vlemnick's solution was redressed in a therapeutically suggestive name and sold to dentists at an exorbitant price as a pyorrhea cure. These cases can be multiplied endlessly, and their use defeats the aims both of dentistry and pharmacy.

HOW THE DENTAL ASSOCIATION IS MEETING THE PROBLEM

The work of the Council alluded to briefly has made dentists appreciate that the interests of their patients in this respect can be fully served only by prescribing drugs not on the alluring appeals framed in some advertising office but on an intelligent understanding and use of such drugs, as the individual needs of the patient require. This connotes an understanding of the composition, actions and claims of the drugs. It is gratifying to note that dentists are beginning to ap-

preciate the importance of a wide usage of official drugs and preparations made therefrom as against non-acceptable unofficial drugs

The term "official drug" is well understood but neither the interests of dentistry or pharmacists are advanced if one puts out a mixture of several official drugs and puts them out under a non-informing name. This is a practice that deserves to be discouraged. This is being discouraged on our part by encouraging the dentist to make greater use of the official drugs, and to avail himself of the service of competent pharmacists. Progress depends on an understanding of the problem at hand. To accelerate this progress, the Council's work has, of necessity, fallen into several categories. It accepts those articles that conform to a printed set of rules. These rules relate to composition, tests for identity and purity, advertising to the public and advertising to the profession, therapeutic claims, naming of articles and rationality of mixtures. It will be at once recognized that these rules are essentially those of the Council on Pharmacy and Chemistry of the American Medical Association. Their value to the medical profession and to the public have been amply demonstrated in the past twenty-five years. Inasmuch as dentifrices present a somewhat different problem, the Council has published a separate set of provisions. Dentifrices are acceptable if, among other things, they are advertised solely as an aid to the tooth brush in cleansing the teeth. The list *Accepted Dental Remedies* now carries reference to 166 proprietary articles and many official articles, but more of this later.

With the aid of the A. D. A. Bureau of Chemistry, the Council examines proprietary articles on the market for their compliance with the rules. Many of the articles already examined are those of secret composition and advertised with claims which are palpably false or unwarranted. This constitutes a large part of the work. Reports discussing the unacceptability of these products appear in the *Journal of the American Dental Association* from time to time.

A further appreciation of wider problems in dental therapeutics is given readers of the *Journal* through a series of reports on the general subject of pharmacology and therapeutics. These general articles are prepared by members of the Council or by outsiders who are invited by the Council for their special knowledge in separate fields. By way of illustration, some of the titles of articles which have already appeared are "Causes and Treatment of Systemic Reactions in Local Anesthesia," "Endocrines and Teeth," "Glycerin in Toothpastes," "Mouth Washes," "Pre-Medication and Post-Medication for Dentists and Oral Surgeons," "Scientific and Rational Therapeutics—Its Effect on Dental Progress," "Stock Solutions and Mixtures for Local Anesthesia," "Uses and Abuses of Barbitals," "Uses of Pain Relievers in Fixed Proportions by Dentists."

In addition thousands of inquiries from dentists are answered every year on various official and nonofficial products.

ACCEPTED DENTAL REMEDIES

It is sometimes amusing, if not tragic, to meet pharmacists of all shades who have the impression that dentists do not prescribe beyond mouth washes and dentifrices. Let it be said at the outset that dentifrices and mouth washes are an extremely negligible part of the dentist's interest in materia medica. As a matter

of fact, the Council considers the ordinary run of mouth washes as no more useful than the use of talcum powder after shaving

It was suggested above that the Council includes acceptable proprietary drugs in a list designated as *Accepted Dental Remedies*. The list, which will soon appear in book form, includes not only these acceptable proprietary articles but also information on useful official drugs and preparations.¹ The inspiration for this little volume has come from "New and Nonofficial Remedies" of the Council on Pharmacy and Chemistry and "Useful Drugs" of the American Medical Association. The information, however, is devised for the members of the dental profession. Preliminary estimates indicate that this little volume will be required or recommended in almost all of the dental schools of the country. It should also have an interest for pharmacists as a point of contact with the dental profession.

In addition to the drugs listed therein, there will be appendices on metrology, solubility of drugs, symptoms and treatment of poisoning, therapeutic indices, and so forth. As an indication of the character of the drugs included, the following selected classes, taken from one of the indices of the book, may be useful:

General Anesthetics—Nitrous oxide, ether, chloroform, ethylene, ethyl chloride, etc

Local Anesthetics—Cocaine, procaine, butyn, apothesine, tutocaine and their various recipes

Drugs Acting on the Central Nervous System—Strychnine, atropine, morphine, caffeine and a wide variety of hypnotics and anodynes or analgesics, such as barbitals, acetanilid, acetphenetidin, acetylsalicylic acid, codeine, etc

Drugs Acting on the Circulation—Epinephrine, nitrites, etc

Drugs acting on the alimentary canal, and a large class of drugs of purely local action such as astringents, styptics, antiseptics, germicides, etc

The extent of the list should surprise no one when consideration is given to the relatively wide field in which the dentist works and the appreciation that has come in the last decades of the relation between the mouth and cognate apparatus and the rest of the human body.

It is not my intention to bore you with formulas or recipes. They may be obtained from many textbooks and other sources.² The important point is for pharmacists to acquaint themselves with the demands of the dentists and supply them. These products will range from such simple and innocuous products like dentifrices and non-medicated mouth washes to such agents as are used for the treatment of pyorrhea, trench mouth and the more involved surgical manipulations of dentistry.

HOW PHARMACY CAN MEET THE PROBLEM

Millions are spent yearly to advertise proprietary products to the dental profession. The advertising manager of one of the better pharmaceutical houses has pointed out that recommendations by dentists have started many an unknown proprietary on the road to fortune. Those worthy of the dentist's attention will

¹ Now available from American Dental Association. All dental schools with few exceptions make use of the book.

² Recent articles of interest in this connection are Blass, J. Lewis, Ph G, D D S "Medicinal Aids in General Dentistry," *Dental Cosmos*, 76, 239 (February 1934).

Aguiar, James E. Ph G, D D S, "Dental Medicines. Modern Pharmacologic and Therapeutic Principles Applied to Their Use in General Practice" *Dental Cosmos*, 75, 1184 (December 1933).

be in *Accepted Dental Remedies*, and no doubt will be available from pharmacies. No dental journal which goes to dentists engaged in the general practice of dentistry censors its advertising on a published basis except the *Journal of the American Dental Association*. Some of these journals are sent gratis to dentists. The circulation cost is defrayed by dental supply houses. In these journals may be found advertised the old well-known mixtures, clothed in fancy and appealing names, foreign to the nomenclature of the Pharmacopœia. *Apropos* of this, the late Professor Puckner of the Council on Pharmacy and Chemistry has aptly pointed out that if a law were enacted to oblige manufacturers to sell medicinal products under a properly descriptive name or make it illegal for a dentist or physician to use or prescribe them, the use of most proprietary remedies would be discontinued and successful newcomers might each year be counted on the fingers of one hand.

This multiplication of trade names for well-known preparations is used to disparage the well-known and useful preparations, and the assumed advantages of the new mixtures are extolled. For example, procaine base has been known to chemists, physicians and dentists for many years. Its pharmacologic properties were well worked out by Gros in 1910, and confirmed by Sollmann and others since then. Recently there has come on the market, primarily to dentists, the same procaine base in lanolin, and other non-essential ingredients, and heralded to the dentist with the following statements:

There has been a continuous search, since Koller's use of cocaine in 1884, for a drug to be used as a topical anesthetic, possessing the ability to penetrate mucous membranes, yet having low toxicity."

There are available in the Pharmacopœia, several drugs of proven usefulness for topical anesthesia, even considering the limitations of this form of anesthesia, such as benzocain, ethyl chloride, cocaine and others.

In the treatment of trench mouth, besides his operative technique, the dentist uses a wide variety of drugs, ranging from escharotics, such as chromic acid, to milder drugs like sodium perborate, and even salt solutions. In between these two extremes are found occasionally the use of mercuric chloride, hydrogen peroxide, bismuth compounds and the organic arsenicals. It is desirable that arsenicals and other unstable preparations be freshly prepared. Hence there is no rational reason why the pharmacist should not acquaint the dentist how he can furnish these preparations at a greatly reduced cost and moreover on a basis that more fully benefits both.

An incident will illustrate the benefits of intelligent cooperation. Sometime ago a dentist who had been having post-operative difficulty with the stock solution of a local anesthetic that he had been using invited my assistance. The matter was discussed with the result that a method was worked out whereby he could prepare his own solutions of procaine and epinephrine in an alkaline medium. This has been a little over a year ago. This particular dentist is highly pleased not alone with the fact that he has been able to effect a considerable saving, but more importantly, the feeling that his patients are more comfortable. Furthermore there is a sense of accomplishment and prestige that comes from knowing in detail the preparation of the material he was injecting into his patient, rather than depending on semi-secret preparations as he had been in the custom of using. This is not an isolated case. Such examples may be cited over and over again.

In the course of his practice, a dentist uses many hypnotics and analgesics. Unfortunately in the past he has been an unwitting salesman for the shot-gun mixtures so long disparaged by students of the problem. The extent of his prescribing was reached when he handed out a package with two or three tablets, but the package bore the name, in large type, and directions that invited self-medication for real or imaginary ills foreign to the purpose of the case. There is a legitimate field of interest between pharmacy and dentistry in this respect, since many dentists write prescriptions for drugs for the relief of pre- and post-operative pain. But the system is not as general as it should be. Some dentists are reluctant to write prescriptions, because of the economic aspect. If they wish their patients to have a limited number of doses, let us say of an hypnotic, they find the cost unnecessarily high. Hence they carry in their own medicine cabinets a stock for dispensing. This should by no means be discouraging to pharmacists, but should rather be seized as an opportunity. It is well known that the mode of administration is an important factor in drug action. Sometimes a cachet or a capsule may be preferable to the compressed or the triturated tablet. The situation is somewhat analogous to the use of drugs by ophthalmologists and other medical specialists. The oculist does not write a prescription for each dose of atropine he uses for mydriasis. Yet the filling of this class of prescription is a point of pride with many professional pharmacies.

Despite the successful operation of many pharmacies, meeting the highest requirements of scientific dispensing, the dentist still obtains his drugs from other sources, and to his economic disparagement and sometimes as already indicated to the unwitting abuse of his patient. For example, Eugenol sold under another name sells for ten times its real cost. Preparations essentially zinc oxide, used by dentists for so-called pulp capping, are purchased by dentists at the rate of seventy-two dollars for a pound. The pharmacist can sell C P zinc oxide at one dollar a pound and yet make more than a fair profit.

The Council has pointed out that mouth washes are of little or no value in the treatment of dental disease. Yet their limited usefulness is recognized because of the pleasant feeling they leave after operative procedures. Without becoming involved in details, Dean Schicks has rendered a useful service by placing on record certain mouth washes of open composition. These can be detailed by pharmacists to dentists at a reasonable cost.

Aside from personal solicitation which should always be employed wherever possible, the pharmacist may acquaint himself with the needs of dentists by following regularly the reports of the Council on Dental Therapeutics which appear in the *Journal of the American Dental Association*, and particularly to acquaint themselves with the material in the little book, "Accepted Dental Remedies," about to be published. The descriptions in this volume will, on the whole, be free of recipes and here the pharmacist can assist the dentist by acquainting him with the most advantageous pharmaceutical use of the various useful drugs.

Professor Schicks of Rutgers University School of Pharmacy must be regarded as a pioneer among pharmacists in bringing together both groups. The circumstance that several meetings of the American Association of Colleges of Pharmacy have been devoted to the prescription requirements of dentists is an omen for success. Further it is a source of encouragement to know of the meetings of local

dentists with members of Professor Schicks' school. This is a phase of the work that should be fostered by more schools of pharmacy, pharmacy associations and dentists. Professor Schicks' experience indicates that dentists will welcome such efforts. It appears that the schools of pharmacy and dentistry of the same university can find common meeting ground.

Just as advertisers find it profitable to spend millions in the attempt to make dentists proprietary-minded conscious, pharmacists can work to make dentists pharmacopœial conscious. Any effort of this kind that draws its inspiration from the ideals of both professions cannot help but benefit the public for whom both professions aim to serve.

THE PLACE OF A FIELD REPRESENTATIVE IN COOPERATIVE PROFESSIONAL ADVERTISING *

BY L. WAIT RISING

This era of economic decadence is witnessing the rebirth of professional pharmacy. There was a time, not so many years ago, when such a movement could only be predicted, and that with some hesitancy. But the competitive scramble in low-priced drug sundries brought on by the period of depression has changed prediction to actuality. Pharmacy is going professional. Even now a sufficiently large percentage of the existing drug stores are being made over, or will be shortly, into pharmacies with true professional ideals and methods of doing business which warrant the setting up of a new classification to take care of them. While they were the exception rather than the rule, their very minority made apparent the uselessness of dealing with them as a group.

However, this has changed. When speaking of pharmacies to-day we must differentiate between two kinds. The merchandising establishment of the "corner drug store" variety, and the prescription pharmacy, which, while no less a merchandising unit in its way, is not considered as a true retail store by the laity.

This amounts to a division of trade, and brings with it not a division but a whole new set of merchandising principles and problems that apply only to the prescription pharmacy. One of the latter is advertising. It is trite to say that a professional pharmacy cannot advertise in the same manner as the ordinary retail store. Its appeal must be both dignified and restricted and it must be directed at the physician as much or more than at the general public. Many drug stores conduct a profitable business without physician cooperation, the lack of which would quickly throttle the prescription pharmacies.

What then are the best advertising methods for securing this necessary professional friendship? Indirect contact through the mails is good and is a means of reaching the doctor periodically which is open to every pharmacist. There is no limit to the number of physicians one pharmacist can reach in this way nor to the number of times such contact can be made. A mail campaign will serve to focus some attention on the organization conducting it.

A second and perhaps the ideal way to attract professional patronage, especially if it be combined with a mail campaign, is by frequent personal contact with the

* Section on Practical Pharmacy and Dispensing, A. P. H. A., Washington meeting, 1934

physicians whose business is being sought. By this means alone can the pharmacist obtain the full measure of value for his advertising effort. To interview a physician is to be given the fullest opportunity to convince him of the merits of the pharmacy in question. There is no chance for him to throw away unnoticed advertising of this nature. It cannot be tabled to be perused some other time, only to be forgotten completely. The story of the pharmacist is put across right then. And if it is interestingly presented, there will be questions to answer that mean openings for other messages perhaps unrelated to the subject upon which it was first intended to interview the doctor, but none-the-less valuable. Through these conversations the deeper medical interests of the physician can be learned, the special pharmaceutical and therapeutic services which he would like rendered him can be ascertained. It is obvious without pointing out other advantages accruing both to the physician and the pharmacist from these periodic visits to the office of the former, that a mutually beneficial cooperative relationship can be established as a direct result.

Just how near the actual results obtained by this contact advertising approach the theoretical total possible to achieve will depend primarily on the man making the contacts. The pharmacy being represented must measure up in full to all that is claimed for it, but the fact that it does is of secondary importance when we consider the factor most responsible for the ultimate success of a personal contact campaign. Given two establishments possessing equal physical equipment, the one with the better contact man will attract more than half the professional business. In other words, inanimate advertising assets such as superior facilities are not worth as much to a business as the men who go out and tell about them.

Not all pharmacists are equally good at the telling. A large number of excellent pharmacists are unable to compete satisfactorily in a serious program of selling their organizations through personal calls. Figuratively speaking, they are forced to hide their lights under a bushel. That is poor economics. It gives all the advantage to the pharmacy possessing poorer equipment but having a better personality in representing it to the medical profession.

There is, however, a way to offset this disadvantage and to obtain the proper kind of representation, especially in the more thickly settled localities. It is one that has been tried before but with no wide acceptance following its use. This lack of acclaim probably resulted from certain difficulties which will be pointed out later. If, therefore, a simple alteration or complete removal of one or two inhibitory influences would rehabilitate an old, indifferently successful contact system, the plan certainly merits review.

The method is fundamentally this. In any community where there are a number of drug stores, let those which place a premium on the professional business cooperate in a common advertising program which can be supplemented by the individual organizations as they see fit. The stores would, of course, be carefully chosen. The proper choice of the pharmacies participating is vital. Proximity of location which means competition is not of such importance as the caliber of the various units of the organization. When a miscellaneous group is represented, there will always be one or more which by bad precept or example destroy the faith of the physicians in the entire membership. This has been forcibly demonstrated when pharmaceutical associations have attempted personal visitation work. Care-

ful selection of the participating stores eliminates that disadvantage and also eliminates inefficient direction of the campaign

The stores so united would pool the bulk of their advertising funds, thus obtaining a fair-sized treasury. The sum made available would vary, depending on the number of stores cooperating and the average annual allowance they set aside for advertising purposes, but the minimum would scarcely be less than \$2400.00.

With this budget, the group is now able to hire a full-time field representative whose chief duty will be to make office contacts with the physicians. The salary that can be paid for this work would be sufficiently large to attract men of excellent training and who possess distinct capabilities for the task in hand. This means that each of the cooperating pharmacists can now have as a part-time member of their staffs, a man more able in personal contact or detail work than themselves. This man is to be considered as only a part-time member of the individual staffs, because he is working specifically as an emissary of each pharmacy only when he is calling on the doctors designated by that pharmacy as the ones it particularly wants approached.

Two major results are immediately achieved. The pharmacists are assured of the most efficient representation among the men from whence their business springs. This major advertising problem solved, they now have more time for other important details of business.

The messages to be carried by the field representative to the physicians will naturally be influenced by many factors, but their objectives will always be the same—namely, selling the professional services and personalities of the pharmacies combining in the advertising effort. By this method the physicians in a given locality are constantly being reminded by pleasant contact with a personal representative of Blank's pharmacy that it can best serve their needs. And because the proper kind of man is doing the detailing, the doctors have a person upon whom they can rely for valuable assistance with both pharmaceutical and therapeutic problems. For this reason alone they will always be glad to see him and more than will incline to place considerable confidence in the pharmacies he represents.

In addition to his worth as a personal contact man, the field representative can earn his money in other ways. Because he is constantly meeting and studying a hundred or more doctors, his advice is invaluable in building up and coordinating advertising campaigns to be carried on by the individual units of the organization during the intervals between his visits to the physicians with whom they specifically requested to contact. He can in this fashion gear the minor advertising efforts to a higher degree of efficiency. By watching the prescribing tendencies of his doctors, he can assist materially in shifting slow prescription stock to places where it will move more quickly. Even in the matter of developing a fair pricing system for prescriptions his advice will be helpful. These suggest just a few of the ways in which a field representative having a knowledge of the problems and an interest in a number of professional pharmacies can more than pay his way.

It may be said with considerable truth that any pharmacy can, by using its regular staff, obtain for itself the personal contacts, carry on other advertising efforts, and do any number of other things calculated to build better professional relations and increase professional business. But the point is—how many of them

will do it without some organization such as has been suggested? This furnishes the stimulus which is all too often needed to galvanize individual initiative into full action

"PATENT MEDICINES"*

BY J HAMPTON HOCH

Down the street the flaming neon sign casts its ruddy lure—"Cut-Rate Patent Medicines" Cut-rate they may be, but are they patent medicines? Nostrums of proprietary origin having registered and protected names are called "patent medicines" but, in the legal sense of the word, a patent medicine is one whose composition or method of preparation or both has been patented and is not a secret because these facts appear in the patent specifications and become public property at the end of seventeen years. The distinction between a patent and a proprietary medicine, as these terms are generally used to-day, was non-existent three hundred years ago when preparations of this type originated.

Back in 17th century England, a year before Charles I ascended the throne, the "Arcanum Goddardianum," more familiarly called Goddard's Drops, was patented. This first patent medicine acquired such a wide reputation as a specific for epilepsy that Charles II, thinking to benefit humanity by making the formula accessible, purchased the secret of its preparation from Dr Goddard for 1500 pounds. And therefore it was also called "King Charles' Drops" or simply the "King's Drops" or, later, "Royal English Drops" and "English Drops." Spirit of human skull and opium, for these were the ingredients, sound revolting even for such a dread affliction as the "falling sickness," but, then, strong stomachs had our fathers of old.

The fact that Jonathan Goddard obtained a purchaser with a copious pocket undoubtedly stimulated the appearance of the many nostrums and proprietaries which followed this first one. Advertisements in the press reveal the wide distribution of trades which adopted proprietary remedies as side-lines—stationers, booksellers, tinsmiths, hosiers—all bent on selling this "sovereign cure" or "effectual remedy" and that "established medicine" which is to be had "no where else." And frequently the public was warned against imitators.

The English settlers who migrated to these shores demanded those remedies with which they were familiar in the old country and it was not long before the news-sheets of America advertised the same preparations in the same way, all of which probably made the "cover to cover" reader feel quite as if he were back in England.

Among the better known proprietaries of the 17th century which were advertised in the early newspapers of the Southern Colonies and set forth in glowing terms to the credulous reader we find Anderson's Scots' Pills, Dutch Drops, Daffy's Elixir, Lockyer's Pills and Stoughton's Elixir.

ANDERSON'S PILLS

The originator of this proprietary was a Scotch physician, Dr Patrick Anderson, who claimed to have obtained the formula in Venice. The actual formula has been disputed for a long

* Section on Historical Pharmacy, A. P. H. A., Washington meeting, 1934

time, but contained Barbadoes aloe as its main constituent along with jalap and oil of anise. Various published formulas note soap, ivory black, colocynth, gamboge, black hellebore, potassium subcarbonate, and syrup of buckthorn as excipients or additional constituents. The pills were 3 or 4 grains in weight and sold for 1 shilling the box.

After Anderson's death his daughter made and sold the pills, subsequently passing to Thomas Weir of Edinburgh the right of manufacture. Weir obtained a patent on them in 1687. In the early part of the next century Mrs. Isabella Inghish (or English), then the proprietress, explained how the genuine product was to be recognized: "The true Pills have their Boxes sealed on the Top (in black Wax) with a Lion Rampant, and 3 Mallets Argent, Dr. Anderson's Head between I I with his Name round it, and Isabella Inghish underneath, the Shield in a Scroll."

DUTCH DROPS

This proprietary, first made in Haarlem in 1672, had as its basis the residue left in the distillation of oil of turpentine. To this red, viscid and resinous matter (called Balsam of Turpentine) was added spirit of nitrous ether, tincture of guaiac and small portions of oil of amber and oil of cloves.

Two and a half centuries have rolled over the sands of time without obliterating this preparation, which is certainly noteworthy for its longevity. Dutch Drops were originally sold for half a guinea a bottle and are said to have netted the proprietors handsome returns.

DAFFY'S ELIXIR

This compound like all the more popular proprietaries was widely counterfeited and there are several formulas for its preparation. Anthony Daffy, "Student in Physick," was probably the originator, and in a pamphlet of 1673, "Elixir Salutis the choise drink of health or Health Bringing Drink," he lauds his "Secret" as "far beyond any Medicament yet known." Following Daffy's death (1750), his widow continued the business. Later, Mrs. Mary Swinton, "niece and executrix of Anthony Daffy and wife of Dr. Peter Swinton, who has prepared and in her name sold the true Daffy's Elixir," charged 6 shillings for a pint bottle. The Swinton formula called for Jalap, 3 lb, Senna, 2 oz, Coriander Seed, Aniseed, Liquorice Root and Elecampane, of each 4 oz, Spirit of Wine and Water, of each a gallon. The Tinctura Sennæ Compositæ of the British Pharmacopœia is a lineal descendent of this old proprietary.

LOCKYER'S PILLS

The vainglorious Lionel Lockyer used his tomb to advertise his most Excellent Pills called *Pillulæ Radijs Solis Extractæ*. The magniloquent epitaph in the Cathedral of St. Saviour, Southwark reads:

"Here Lockyer lies interr'd enough his name
Speakes one, hath few competitors in fame
A name soe Greate soe Generale may scorne
Inscriptions w'h doe vulgar tombs adorne,
A diminution 'tis to write in verse
His eulogies, w'h most mens' mouths rehearse
His virtues and his PILLS are soe well known
That envy can't confine them under stone
But they'l survive his dust and not expire
Till all things else at th' universall fire
This verse is lost his Pill embalmes him safe
To future times with out an Epitaph"

Although disclaiming the use of "turpeth minerale," "the sulphur of antimony" or "crude mercury" in his pills, Lockyer did not divulge its composition or method of preparation. The dose of this "Universall Medicine" seems to have been somewhat flexible since four were "a good ordinary Dose, the which contains some six Grains." Each tin of pills was "Lapt up in Papers" and bore the signatures of the proprietors "and Sealed at one end with the Doctor's Coat of Arms, being Three Boars Heads." A four-shilling box contained "above One hundred Pills (sometimes

more and sometimes less, according as they are in bigness),” for two shillings one received “about Fifty in the Half-Box ” Accuracy and pharmaceutic elegance were evidently not a *sine qua non*

An early 18th century dispensatory which purports to give the basis of Lockyer's Pill directs “Panacea of Antimony, 4 parts, Opium, 1½ parts, Extract of black Hellebore, 3 parts ”

These pills were vaunted as a cure-all in the broadest sense of the term, *viz*

‘Falling-Sickness, Frenzy, Vertigo, Rheums or Defluxions, Head ach of all Kinds, Convulsion Fits, Difficulty of Breathing, Stoppage of the Stomach, Cough, Tisick, Inflammation of the Lungs, Consumption, Want of Appetite, bad Digestion, Pain in the Stomach, Worms of all Kinds, Colick, Inflammations and Obstructions of the Liver, Corruption, Putrefaction of the Blood, Jaundies, Black and Yellow, Dropsie or Tympany, Hard Swellings, Pain and Inflammations of the Spleen, Overflowing of the Gall, Trembling of the Heart, Swoonings, Stoppage and Scalding of Urine, Bloody-Flux, Gravel and Stone in the Reins and Bladder, Rickets, King's Evil Tumours and Hard Swellings, and Ulcers on the Body, Leprosie, Scurvy, Scab, Itch, the Gonorrhoea or Running of the Reins, the Pox, the Gout, Violent and Hectick Fevers, Agues, Green-Sickness, Fits of the Mother, Stoppage of Terms, restores Radical Moisture, cleanses and strengthens the Spermatick Vessels, increases and animates the Seed in both Sexes, fortifies the Womb preserves the Embryo, strengthens the Child, prevents Miscarriage, restores the lost Delight of Nature and absolutely cures all Barrenness curable by Medicine, Antidote against all Contagious Aurs and Infectious Diseases, and perfectly resists all Foulness and Infection in the Act of Generation, mundifies and cleanses the Skin, restores and increases Beauty, makes Old Age Comely and Beautiful and the Countenance of all to be Cheerful and Sanguine ”

STOUGHTON'S ELIXIR STOMACHICUM

“Poplicola” writing in the *Gentleman's Magazine* for August 1748, says “By nostrums I mean such medicines as are kept a secret for the use of the proprietors, though advertised for the benefit of the public ” Then, indeed, Richard Stoughton's preparation certainly qualifies, for he was cunning enough not to be too exact in his patent specifications (thereby keeping his secret) and his “bitters” were not lacking in the public notices

The patent grant from Queen Anne to ‘our trusty and well-beloved Richard Stoughton, Apothecary’ is dated 1712, but the “Unicorn, in Southwark” saw many bottles of “Stoughton's Drops” or “Stoughton's Cordial Elixir” sold at 1 shilling, years before the patent was issued Perhaps the only reason for obtaining a patent was to warn off the bolder counterfeiters

Many other “patents,” some of greater and some of less renown, are to be found mentioned in the columns of the early news-sheets of the American Colonies Godfrey's Cordial, Freeman's Elixir, Squire's Elixir, Bateman's Drops, Turlington's Balsam of Life, James' Powder, Hooper's Pills, Schwanberg's Liquid Shell, Dr Ward's White Drops, Misauibus' Pills, Eaton's Styptic

Time has seen most of these preparations interred in the therapeutic graveyard, but here and there one has survived, if in a somewhat modified form, and has won through to a wider field of usefulness in our official standards

WISCONSIN PHARMACEUTICAL ASSOCIATION

The Wisconsin Pharmaceutical Association will hold a one day meeting at the Park Hotel Madison, February 27th The purpose of this meeting is to do important legislative work and to have a business session to take up such other matters as may be important Legislative subjects which will be discussed are

- 1 The proposed Wisconsin Fair Trade Act commonly called the Junior Capper-Kelly Bill
- 2 Suggested changes in pharmacy laws
- 3 Retention of medicinal liquor permit
- 4 Peddlers' Ordinance for local communities
- 5 State narcotic legislation as requested by United States Commissioner of Narcotics

EMINENT AMERICAN PHARMACOGNOSISTS OF THE
NINETEENTH CENTURY *

BY HEBER W YOUNGKEN

In approaching this topic I am at once confronted with the problem of scope. Shall I record in this humble historical effort the life and work of all of the pharmacognosists who have risen to eminence in America and whose earthly activities began during the Nineteenth Century or shall I limit the field of my theme to those of that distinguished number whose labors have ended but whose souls abide with us? I have chosen the latter course as more appropriate at this time, being duly mindful of the outstanding work and worth of the others who are still living but whose labors for the advancement of science have not ceased

JOHN M. MAISCH

JOHN M. MAISCH (1831-1893)

The pioneer in American pharmacognosy was undoubtedly John Michael Maisch, son of a German merchant, who was born at Hanau on the Main on January 30, 1831. After a brief period of education in a private school and later in a city school, he determined to enter the jewelry business when a little more than twelve years of age. While pursuing his apprenticeship he took instruction in the Realschule and Oberrealschule and soon evinced interest in botany, zoology and theology. He early conceived the idea of the union of religion and science and was encouraged to prepare for the university by his teachers. During this preparation he took chemistry under Professor Bromeis and became so interested in the

natural sciences that he gave up the idea of the ministry. He had so overexerted himself through the study of the dead languages and other preparatory subjects that his health failed and his university plans were abandoned.

In 1849 Maisch came to America. He was almost penniless when he arrived in Baltimore and, in order to supply the necessities of life, obtained work for about six months in a paper box factory. While there he met a Dr. Wiss who, in 1850, opened a drug store and hired young Maisch as his assistant. Maisch was very ambitious and eagerly sought instruction from Dr. Wiss and Dr. Vogler, making constant use of Dr. Wiss' pharmaceutical books during his spare time. The store was sold in 1851 and young Maisch obtained work in another drug store in Washington until 1853. From 1853-1855 he worked in drug stores in Philadelphia and New York and in a chemical establishment in Brooklyn.

In 1856 he returned to Philadelphia to accept employment as clerk for E. B.

* Section on Historical Pharmacy, A. P. H. A., Madison meeting, 1934

Garrigues and Robert Shoemaker and Company, positions he held until 1859. He then was called to teach in Professor Parrish's School of Pharmacy at 8th and Arch Streets.

In 1861 he accepted the call to the chair of Pharmacy and Materia Medica in the College of Pharmacy of the City of New York which he occupied for two years, working during his spare time in the laboratory of E. R. Squibb.

The Civil War was on and Maisch was called in 1863 to organize and conduct the United States Army Laboratory at Philadelphia becoming director thereof until the end of the war.

After the close of the war he conducted a drug store at 1607 Ridge Avenue, Philadelphia, until 1871 when he sold it to give his entire time to teaching and the secretaryship of the AMERICAN PHARMACEUTICAL ASSOCIATION.

In 1866, Professor Maisch was elected to the chair of Pharmacy at the Philadelphia College of Pharmacy, succeeding William Procter, Jr. The following year he exchanged chairs with Professor Parrish by mutual consent and the title of the chair was changed to Materia Medica and Botany. This chair Maisch retained for 26 years, or until the time of his death. As a teacher he impressed his strong personality upon all whose fortune it was to sit at his feet.

Professor Maisch was a prolific writer, a persistent observer and a careful investigator. He was the first American pharmacognosist to recognize the value of the microscope in the study of drugs and adulterants. His hobby was peculiarly that of a searcher after adulterants. As early as 1854 he wrote an article for the *American Journal of Pharmacy* entitled "On the Adulteration of Drugs and Chemical Preparations." Realizing the need of a microscope in his investigations he induced the college to procure one. This arrived in 1861 and Maisch is said to have employed it constantly in his work.

Among his papers bearing upon pharmacognosy were the following: "On *Chelidonium majus*," "African Saffron," "*Lycopodium clavatum*," "Matico," "Purity of Commercial Spanish Saffron," "On the Adulteration of Volatile Oils," "Sneezeweed," "On the Active Principles of *Rhus Toxicodendron*," "Maize as a Sugar Producer," "Maize Oil" and "On the Tubers of *Dioscorea* sp."

From 1870 until his death Maisch was editor of the *American Journal of Pharmacy*. He was co-editor with Dr. Alfred Stille of the "National Dispensatory" and revised or assisted in the revision of a number of text and reference works including the third edition of "A Universal Formulary" by R. Eglesfeld Griffith, M.D. (1874).

In 1882 the first edition of his "Organic Materia Medica" appeared. This text which passed through five editions became the outstanding standard in its field for several generations.

Maisch died of a malignant growth on September 10, 1893, only a short time after being the first American recipient of the Hanbury Medal for distinguished services and for original research in the natural history and chemistry of drugs.

He has rightly been called one of the master minds of American Pharmacy and he can well be ranked as one of the most industrious and versatile of workers in the field of international pharmacognosy.

EDSON S. BASTIN (1843-1897)

Edson Sewell Bastin was born in Ozaukee County, Wisconsin, on May 29, 1843. His boyhood was spent on a farm where he was obliged to work in the summer and attended the district school in the winter. His parents died before he had reached his teens which threw him on his own resources.

At the age of sixteen he entered Carroll College and pursued work there for three years. The Civil War had broken out, and in 1862 he enlisted in the 28th regiment of Wisconsin volunteer infantry. Within two years after enlistment he was commissioned Captain of the 4th Arkansas Cavalry. Following the war he was offered a cadetship at West Point, but declined the honor and instead entered Chicago University from which he graduated in 1867. In the Fall of the same year he entered the Theological School of the same University and graduated with the

B. D. in 1870. He had intended to preach but his great interest in Botany and other natural sciences influenced him to enter Pharmacy as a means to the end. He was United States Marshal in Indian Territory for several years, and in 1874 returned to Chicago to accept the position as registrar of the University of Chicago in which institution he was soon made an Instructor in Botany. In 1876 he was advanced to the Professorship of Botany and Geology and the same year was made a Lecturer on Botany in the Chicago College of Pharmacy.

In 1883 he resigned from the University of Chicago to devote his entire time to the Chicago College of Pharmacy. Here he first established a botanical and microscopical laboratory.

In 1887, he issued his "Elements of Botany" and, in 1889, the second edition of the work appeared under the title of "College

Botany." This work was destined to be his greatest masterpiece and was widely adopted in both academic and pharmaceutical colleges. In 1890, Professor Bastin resigned his position at the Chicago College of Pharmacy to accept the chair of Botany and Materia Medica in the Northwestern University School of Pharmacy. Here he started another microscopical laboratory and wrote papers on "The Flora of the South Shore of Lake Michigan," "Starches in Root Drugs," "Contributions on Plant Hairs," "Detection of Stem Admixtures in Root Drugs," "Plant Crystals" and "Notes on Vegetable Histology."

In the Autumn of 1893 he became Professor of Botany and Materia Medica at the Philadelphia College of Pharmacy as successor to Professor Maisch.

Within a year he brought about the establishment of a botanical and microscopical laboratory and published another excellent book, "Laboratory Exercises in Botany." This work contained several hundred original drawings.

During 1895 he published nine illustrated papers on local and medicinal plants.

EDSON S. BASTIN

In 1896, he and Henry Trimble began a series of papers on "The North American Coniferæ" which they published in the *American Journal of Pharmacy*. While engaged in preparing a text on pharmacognosy he was stricken with exophthalmic goitre and died as a result of cerebral hemorrhage on April 6, 1897, at the age of 54 years.

Professor Bastin was a staunch advocate of the practical study of the natural sciences. His method was that of studying the plant and drug material in hand, using books only as guides.

JULIUS O. SCHLOTTERBECK (1865-1917)

Julius Otto Schlotterbeck was born of German parentage in Ann Arbor, Michigan, September 1, 1865. He received his early education in the public schools of that city and for several years served an apprenticeship in Moore's drug store. In 1885 he matriculated in the School of Pharmacy of the University of Michigan and graduated therefrom in 1887 with the degree of Pharmaceutical Chemist. Shortly after his graduation he became manager of the Eagle Pharmacy in Pittsburgh, Pa., where he served until the Fall of 1888 when he returned to the University of Michigan to become Assistant Instructor in Pharmacognosy and Pharmacy. While serving in this position he pursued studies in the College of Literature, Science and Art of the University from which he was graduated in 1891 with the degree of B.S. in Chemistry. From 1892 to 1895 he was Instructor in Pharmacognosy and Botany in his *Alma Mater*. From 1895 to 1896 he studied abroad at the University of Berne, specializing in Pharmacognosy under the eminent Tschirch and received his Ph.D. in 1896. His inaugural dissertation was on "The Developmental History of Pharmacognostically Important Seeds."

JULIUS O. SCHLOTTERBECK

He returned to Ann Arbor in the Fall of the same year and was made Assistant Professor of Pharmacognosy. In 1904 he was advanced to Junior Professor and in 1905 to Professor and Dean of the College of Pharmacy. For a time he was consulting expert for Frederick Stearns and Company and for the J. Hungerford Smith Company.

He has been rated as one of the best teachers of pharmacognosy in the United States. Many of his pupils have attested to his ability, loyalty, faith and vision as his outstanding characters, he lived these and inspired others to live them.

He was a member of many scientific associations, secretary of the American Conference of Pharmaceutical Faculties 1904-1908 and its president from 1910-1912. He was a member of the Committee on Revision of the United States Pharma-

copœia of 1900, and chairman of the Scientific Section of the AMERICAN PHARMACEUTICAL ASSOCIATION from 1902-1903

Dr Schlotterbeck was a brilliant investigator in the fields of pharmacognosy and phytochemistry. He received two Ebert Prizes for outstanding work in the sciences. Among his original contributions are included the following: "Notes on the Behavior of Albuminate of Iron and Ferratin with Artificial Gastric Juice" (with S R Boyce), "Analysis of Kola" (with J W T Knox), "Comparative Structure of the Leaves of *Datura Stramonium*, *Atropa Belladonna* and *Hyoscyamus Niger*" (with A Van Zwaluwenburg), "Clove Bark" (with A Van Zwaluwenburg), "Developmental History of Important Seeds: Cotton Seed and Cacao Seed" (with A Van Zwaluwenburg), "The Alkaloids of *Bocconia Cordata* and the Assay of *Sanguinaria* and Its Preparations" (with Paul Murrill), "The Nature of Commercial Sanguinarine Nitrate, *Adlumia Cirrhosa*: A New Protopine Bearing Plant," "The Structure and Development of the Fruit of *Illicium Floridanum*" (with C R Eckler), "Contribution to the Chemistry of *Stylophorum Diphyllum*" (with H C Watkins), "Does *Argemone Mexicana* Contain Morphine?" "The Development and Structure of the Seed of *Stylophorum Diphyllum* and *Chelidonium Majus*," "The Alkaloids of *Adlumia Cirrhosa*" (with H C Watkins), two papers on "Contribution to the Chemistry of Chelidonine" (with Watkins and Knapp, respectively), "Contribution to the Chemistry of *Bocconia Cordata*" (with W H Blome), "The Development and Structure of the Seed of *Argemone Mexicana*" and "Vanilla Extract" (with J R Dean).

Dr Schlotterbeck was devoted to his wife and family of two boys and one girl, and was delightful company according to many of his friends. He loved music and played the piano well. He also had a fine sense of humor and possessed that rare gift of being able to tell a story well. Due to his German parentage and early training, he spoke German fluently which proved invaluable to him while studying for the doctor's degree at Berne under Tschirch.

In September 1916, while attending a meeting in New York, he was taken ill. Two periods in the hospital failed to help him and he died of a lingering illness at his home in Ann Arbor, June 1, 1917.

(To be concluded)

NEW ZEALAND PHARMACEUTICAL CONFERENCE

Pharmacists from all States and New Zealand met in Melbourne to attend the biennial meeting of the Pharmaceutical Association of Australia and New Zealand.

A varied program of work and entertainment was provided. Commencing with the meeting of the Sciences Association, pharmacy is represented by Section "O" (Pharmaceutical Science) and at the various sessions some valuable contributions of a scientific nature were made. A full session was devoted to "The Expanding Pharmaceutical Curriculum." Dr Roy Gardner, F I C, of New Zealand, presided at the Section "O" meetings, and as the official guest of the Pharmaceutical Society of Victoria,

A R Penfold, of the Sydney Technological Museum, whose work on the Eucalyptus is well known, read two special papers on the subject. Other leading pharmaceutical authorities presented communications that were interesting and instructive.

Following on the Section 'O' sessions the Pharmaceutical Association held its sessions. The Association is the clearing house of Australasian pharmacy. Embracing as it does representatives of all the pharmaceutical bodies in New Zealand and all the Australian States, it focuses attention on national problems, and shapes the pharmaceutical policy for the ensuing two years. A conference of Pharmacy Boards was held after the meeting of the Association.

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS
DEPARTMENT

The following paper by Professor Briggs together with discussions by Drs Burlage and Langenhan are very timely and of considerable interest to all teachers in colleges of pharmacy, and of particular interest to those who teach the subject of pharmacy. How many of the professors of pharmacy will agree with Dean Briggs' statement that "the work included in the Syllabus outlined under 'Theory of Pharmacy and Pharmaceutical Technique' is overemphasized and is receiving an unwarranted amount of time and credit?" Rarely do we find the professor of any subject stating that the time devoted to the subject is in excess. We will all admire Dean Briggs for his outspoken attitude, but will we agree with his conclusions?—C B JORDAN, *Editor*

THEORY OF PHARMACY AND ACADEMIC STANDARDS

W PAUL BRIGGS *

The beginning of the academic year 1932-1933 marked a mile-stone in pharmaceutical education. After half a century of very questionable requirements in quality and quantity, pharmaceutical degrees were brought to a parity with accepted academic standards. The Bachelor's degree carries with it certain implications of learning as well as rights, privileges and responsibilities. The B S degree stands for a rather definite level of attainment in the various fields of knowledge. In most instances the Baccalaureate degree in any major division of knowledge is accepted as the equivalent of the same degree in any other division. Thus, through resolution, the Profession of Pharmacy has placed the educational requirements of future pharmacists on the same plane as Engineering, Law and other respected professions. But resolutions, traditional degrees and *laissez faire* methods will not succeed in creating or preserving respect for the B S in Pharmacy degree. Such respect and acknowledgment can only be attained and preserved if the educational elements leading to this degree are sound and academically comparable to the elements forming the basis for other B S degrees.

Consider the traditional course usually titled "Theory of Pharmacy." It seems unnecessary to define this title or to describe its scope. Almost every college of pharmacy gives such a course, and the usual textbooks on Pharmacy devote from 168 to 256 pages discussing the theory of Pharmacy. The Pharmaceutical Syllabus requires 256 hours of Theory of Pharmacy, and Pharmaceutical Technique, which, the Syllabus recommends, should parallel each other. Without challenging the need for such instruction, for the moment, consider this fact, 192 didactic hours of Theory of Pharmacy and 64 laboratory hours of Pharmaceutical Technique, assuming that these courses measure up to established academic standards, would receive $13 \frac{1}{3}$ credit (semester) hours, or over 10% of the usual 120 credit (semester) hours required for the B S degree. Bear in mind that this requires more time and more credit (semester) hours than Organic Chemistry and more than Botany and Physics together. Can this be justified academically? With due respect to the purposes of the Syllabus and to the objectives of pharmaceutical educators, I submit that it cannot be justified and further that when these

* Professor of Pharmacy The George Washington University, School of Pharmacy

two pharmacy courses and any other academic course are compared, the results will place pharmaceutical education on the defensive

Over one-half (Sections B and C) of the outline in the Syllabus under Theory of Pharmacy deals with simple details which are necessarily considered in other courses. In discussing, for example, Sulphur or Alcohol under Theory of Pharmacy we are advised by the Syllabus to teach, "commercial phases incidents of historical importance nomenclature, official status, official uses, official preparations, classifications, pharmaceutical uses, methods of handling, preservation, etc." Sulphur and Alcohol, and every other item covered by Sections B and C of the Syllabus, under Theory of Pharmacy must be studied under some other course, such as Inorganic or Organic Pharmaceutical Chemistry. From an academic point of view these facts should be considered at the time these compounds are presented in the courses in Pharmaceutical Chemistry. It is probable that such information is now given in the courses in Pharmaceutical Chemistry, thus duplicating effort and needlessly consuming valuable time.

As to Sections A and D, I feel that the material suggested by the Syllabus is pertinent. However, it appears that tradition has been used as a yardstick rather than progress in developing Section A. The present-day student is educationally far advanced over those of fifty years ago, and Pharmaceutical practice has undergone far-reaching changes. Many students entering upon the study of Pharmacy to-day have had courses in High School Physics and Chemistry. Physics is recommended by the Syllabus, required by many colleges, and should be a part of the scientific training of all pharmacy students. With these conditions in mind, does it not seem that we are overemphasizing, under Theory of Pharmacy and Pharmaceutical Technique, the teaching of "Heat, Evaporation, Solution, Crystallization," etc? This knowledge a student should certainly have but it is not necessary to devote two courses to teaching it. In his laboratory work in Botany, Chemistry, Physics and Pharmacy he actually carries out each of these processes, and does so with a definite objective. Such training is far more valuable than when done in an abstract manner. Preparing Fluidextract Belladonna leaves by percolation presents a vivid picture which is not soon forgotten, but packing a percolator with sawdust smacks of kindergarten methods.

I have discussed in detail the Syllabus outline for Theory of Pharmacy and Pharmaceutical Technique with the members of our Chemistry Department. It was found through this conference that every process and theory, outlined under Pharmaceutical Technique and Section A of Theory of Pharmacy, was actually employed in either the Chemistry or Pharmacy laboratory courses. The scope and methods of teaching General or Inorganic Chemistry have been fairly well fixed and in the majority of universities an 8-credit hour course of 2 lectures and 2, 3-hour laboratories per week for a year is given. No special course is given dealing with technique or process, but when a process is used for the first time, the instructor explains it, and the student proceeds immediately to employ the process to a definite objective. Now, if in teaching Chemistry, the student learns about filtration, precipitation, etc., and uses this knowledge as a means to an end, why in teaching Pharmacy, should the same processes and techniques be taught as Theory of Pharmacy? My answer is that we have been playing "Follow the Leader." Large books were written fifty years ago which attempted to cover

every phase of the practice of pharmacy. They were, in most cases, prepared for apprentices who never expected to attend College and who often possessed less than a grammar school education. To these young men the words filtration, precipitation, vaporization, etc., were terrifying and mysterious and they needed a simple description of the processes and techniques involved. But such is not the case to day. Chemistry courses have shown us that freshmen students can work intelligently in the laboratory without spending 256 hours learning a few simple principles. A few pharmaceutical processes, such as drug extraction, may require more than superficial discussion and demonstration, but most of the work in Pharmaceutical Technique and Section A of Theory of Pharmacy, which is not covered in other courses, could be incorporated as a part of Operative Pharmacy. The old argument that repetition impresses facts upon students may be brought out in defense of the Syllabus. I would answer that argument with two questions. In what other academic courses is duplication resorted to? Are we willing to admit that pharmacy students, apart from all other university students, require repeated drilling in order to acquire knowledge? We should ask ourselves these two questions when we attempt to justify Sections B and C under Theory of Pharmacy. The propriety of Section D is granted but its position in the curriculum is questioned.

Personally, the best results have been obtained by combining the material covered by the Syllabus under Theory of Pharmacy, Pharmaceutical Technique and Operative Pharmacy, and deleting those parts here objected to. For these three courses the Syllabus requires a total of 448 hours. The set-up which has given satisfactory results is a 10-credit (semester) hour course of 96 hours of lecture and 192 hours of laboratory, a total of 288 hours, or $\frac{1}{3}$ less than recommended by the Syllabus for the three courses. In this course everything is carefully covered that the Syllabus includes under Operative Pharmacy. This work is preceded by lectures and demonstrations of the important features of Theory of Pharmacy and Pharmaceutical Technique, omitting those parts which are superfluous or which are adequately covered in other courses. Part D, under Theory of Pharmacy, which deals with the pharmacist as a member of the social order and in a professional status is omitted from this course, but is presented in Dispensing Pharmacy, where it seems to belong.

Results indicate that fundamental educational elements have not been slighted. The students complete the course with a wholesome respect for the work which they have done, they are not hurried and there is no evidence that any essential features of their training have been omitted. This is not offered with the idea that it is a perfect arrangement or that it should be universally adopted, but merely to support my personal views.

It may be that because of the professional background of pharmacy and because of the diversified knowledge which a pharmacist is expected to possess, we are justified in requiring an amount of educational training, in both hours and credits, in excess of the usual requirements for the B S degree. However, I cannot subscribe to this reasoning. When we offer a B S in Pharmacy degree we should compare it academically to a B S degree in Chemistry, Engineering, etc., and not to the purely professional degrees, such as D D S or M D. We have gone on record as approving an established degree for pharmaceutical education and

we should make our curricula conform to the established requirements for that degree. If we require an amount of work much in excess of 120-credit (semester) hours, examination of our curriculum, which is bound to come now that we are granting an academic degree, will raise a serious educational question. The answer will probably be either that our quality requirements are low or that the material of our curriculum does not warrant the credit or hours which we have assigned. By granting a purely professional degree we could avoid this inevitable analysis of our courses, but I most certainly would not recommend meeting the problem in that way.

In conclusion it seems to me that we need to carefully study our several courses, particularly Theory of Pharmacy and Pharmaceutical Technique, and adjust the time and credit evaluations on a sounder academic basis. Let me strongly emphasize here that I do not mean to minimize the necessity or value of these or any other Pharmaceutical courses outlined by the Syllabus. The issue which I raise is essentially a modernization of our traditional courses in the light of academic standards. In the hope of provoking discussion let me restate my stand, that the work included in the Syllabus outlines under Theory of Pharmacy and Pharmaceutical Technique is overemphasized and is receiving an unwarranted amount of time and credit (semester) hours, and, that the entire four-year course in Pharmacy can and should be brought in line with other baccalaureate degree courses in terms of clock hours and credit (semester) hours.

THEORY OF PHARMACY AND ACADEMIC STANDARDS

A DISCUSSION OF A PAPER BY THIS TITLE PRESENTED BY W. PAUL BRIGGS

BY HENRY M. BURLAGE *

In discussing Dean Briggs' paper I wish, first of all, to congratulate him on his efforts and to say that, on the whole, I agree with the content and intent of such discussion. There is no doubt in anyone's mind that the adoption of the minimum four-year course by the colleges of the Association has cast upon the educators in the Profession of Pharmacy new responsibilities. Now that such a course has been obtained after years of struggle and planning, these educators should not sit back with an air of complacency but should direct new efforts to modernizing, stabilizing and unifying a curriculum which was established to meet an unfortunate two- and three-year requirement and as a result has been haphazard in its structure. I am glad to note that Dean Briggs sets forth in part the responsibilities accompanying the new "mile-stone in pharmaceutical education."

In his discussion, the author has singled out those sections of the Pharmaceutical Syllabus, which in my own mind are of greatest importance in our pharmaceutical curriculum in building a theoretical and professional background. It probably would have been much better if the various subdivisions of Theory of Pharmacy, Technique and Operative Pharmacy had been outlined as separate

* Professor of Pharmacy, School of Pharmacy, University of North Carolina, Chapel Hill, N. C.

courses to clarify a confusing situation, especially as to time allotment. This latter fact is evidenced in a study of the curricula and courses of the various member colleges. The greatest thought and consideration should be given to these Sections.

With regard to Sections B and C under Theory of Pharmacy (Syllabus, pages 113-117) there certainly is much in the outline that needs changing to avoid unnecessary duplication. These divisions should be developed still further to include work that is not given in basic courses of General Chemistry (Inorganic Pharmaceutical Chemistry) or Organic Chemistry (Organic Pharmaceutical Chemistry). The courses in chemistry, if basic, cannot certainly give the important aspects of the inorganic and organic medicaments and their requirements, standards, etc. Section B should include non-repetitious material about the official inorganic compounds, studying them from the angle of their periodic classification—not alphabetically as is usually done—accompanied by laboratory work performing the necessary U S P tests and more especially preparing and studying the official preparations involving chemical reactions of these substances. Certainly such course content cannot be presented adequately in a course in General Chemistry of Pharmaceutical Chemistry of a basic character.

Section C should likewise be given after a basic course in Organic or Organic Pharmaceutical Chemistry stressing the official organic drugs and principles and finally, but of rapidly increasing importance, ethical New and Nonofficial Remedies of this character. One needs also only to step behind the prescription counter of the average pharmacy to learn immediately the growing importance and value of a knowledge of medicines of organic character, especially from the dispensing standpoint.

Section A appears as an example where, as the author says, "tradition has been used as a yardstick rather than progress in developing this course." There may be overemphasis and duplication in the teaching of "Heat," but there appears to be a need of a modernized course in technique (or whatever one wishes to call it), which although it might appear simple in its make-up but necessary in curricula in sections of the country, where many of the high schools are small—where one teacher gives instruction in more than one subject with the result that one cannot depend too greatly on the student's knowledge of the simplest processes and theories. Physics and Chemistry are, no doubt, much better presented in the large city high schools and Dean Briggs' statements in this regard would apply to those Pharmacy schools drawing students from the large and well-equipped high schools.

Dean Briggs' statement that every process and theory outlined under Pharmaceutical Technique and Section A of Theory of Pharmacy was actually employed in the chemistry and pharmacy laboratory does not apply to the situation in most schools. It is true that many of the processes should be and are studied or mentioned in General Chemistry. However, in most of the State institutions this subject is taught to the masses in large laboratory and lecture sections with the result that they know little or nothing about the practical applications of processes, the theories and the practices of the same. As a whole they appear as a poorly trained lot, who are only capable of using a laboratory manual of specific directions efficiently. If the processes mentioned are grasped by the students of pharmacy in

other courses as Chemistry and Physics, there certainly is no need of them in our curricula, but I fear that such a fortunate condition does not obtain if my observations in four institutions located in widely separated sections mean anything

I cannot agree that the material in the Syllabus under Theory of Pharmacy, Technique and Operative Pharmacy can be covered in one course of 10 semester hours, but should be in 400-432 hours (18-19 semester hours) including Technique ($48 + 64 = 112$), Galenical Pharmacy ($64 + 96 = 160$), Pharmacy of Inorganic ($32 + 48 = 80$) and Organic Materials ($48 + 0 = 48$ or $48 + 32 = 80$) providing the material in the last two subjects named is not given in Organic Pharmaceutical Chemistry of a non-basic character. This with at least 10 semester hours of Dispensing (totaling 28-29 hours) is equivalent to about 25% of the total hours required for a B S degree. For the same degree in Chemistry, basic courses equivalent to about 35 semester hours are required. There is no question that Part D of Theory of Pharmacy can be adequately placed in other sections.

The author indicates that the textbooks of Pharmacy are too voluminous because of conditions mentioned, it appears that there is a dire need of revising these costly texts into books of a more theoretical nature rather than copies (to a great part) of the U S P and N F. A comparison with the later editions of English texts show some interesting differences as to presentation of pharmaceutical theory and subject matter.

I agree with Dean Briggs that we are not justified in requiring more than the usual 120 semester hours for a B S degree, and in order to stay within these bounds it behooves us to examine our curricula and course contents very closely, in order to withstand and avoid critical examination.

One value of this paper to my mind is the fact that it presents an idea that worthy work might be done in this Conference by devoting a portion of each annual meeting to a very serious and critical examination of course content, distribution, etc., using the Syllabus as a possible starting point with an idea of developing the pharmacy courses so that they might be of the greatest value in developing the knowledge and pride of the student of pharmacy in his profession.

THEORY OF PHARMACY AND ACADEMIC STANDARDS

A DISCUSSION OF A PAPER BY THIS TITLE PRESENTED BY W. PAUL BRIGGS

BY H. A. LANGENHAN *

If you will define Pharmacy (Practical) as the application of the knowledge and training in Physics, Chemistry, Botany, Therapeutics, etc., *to the making of medicine*, you may readily realize that too much time is not given to this subject in any college.

The Syllabus outline is to help, in part, those who are not qualified to teach this subject, and those who do not understand what it is about, who naturally wonder what they should teach and why the subject is listed. Practical Pharmacy is not a special subject, it is a *specialized general subject*.

In order to teach in this broad field a foundation in all of the prerequisite

* Professor of Pharmacy, University of Washington, Seattle, Washington

fields is necessary. The instructor must be sufficiently versed in Physics in order to demonstrate and explain the applications of this field to pharmaceutical operations and methods. He must be able to explain the application of colloidal chemistry in manufacturing, such as extraction emulsification, incompatibility, etc., the application of p_H in connection with preservation, incompatibility, etc. His training in organic and plant chemistry must be broad so that he may discuss the stability or instability of alkaloids, oils, glucosides and other plant constituents in galenic preparations, and the ever-present problem of incompatibility of these substances.

The question of solvents, vehicles, flavors, coloring agents all call for special information to be applied to the making of medicines. The applications of therapeutics and pharmacognosy are important.

The scope of the field of Practical Pharmacy as an applied subject is enormous. One could go on and on citing "applications" of these fundamental subjects.

Up to the present time pharmacy instructors have not been especially trained for this work, but have been compelled to develop their own course of instruction. The type of instruction given is influenced by preliminary training and by the fundamental training of the students entering the classes. It calls for a well-correlated curriculum and a cooperative faculty in order to properly qualify the student in these subjects so that the pharmacy instructor need not teach chemistry, materia medica and other fundamentals, but may devote his entire time to *application* of these fundamentals to the "making of medicine."

In discussing for example, Arsenical Solutions, the instructor should develop the history of arsenicals in general, the pharmacopœial (U S P and foreign) development, the chemistry, the manufacturing, therapeutics, incompatibility, dispensing and correlate this summary with the story of the new arsenic remedies now in use. A skeleton outline of this single subject will indicate the various fundamental fields required for a fair understanding of the subject.

One serious handicap for pharmacy is the teaching of pharmacy students by non-pharmaceutical and non-cooperative teachers, in these fundamental subjects. With the proper preparatory instruction the student is ready for the pharmacy instructor who, if qualified, will find that he has insufficient time in any of the present existing curricula to cover the entire applied field. This application of fundamentals is not repetition, no more than advanced German is a repetition of beginning German. I will not be at Washington, so offer this material for you to present as personal property or any way you wish.

DRUG SALES SCHOOL

Salesmen calling on the drug trade attest to the success of the Sales School of the Detroit Retail Druggists' Association.

An official of the Association said that repeatedly he has been informed that stores are taking on new appearances. Probably the greatest change is the quick appearance of attractive open displays, in many cases the addition of island displays in the store. Other

stores have faced a general clean-up, new store arrangement and display material.

The success of the first school on drug store merchandising has led the Association to plan for another year. It is probable that next year the school will cooperate more closely with the pharmacy departments of local colleges should local druggists show sufficient interest to attract the sponsoring of lecturers. The final two sessions found an increasing attendance — *Detroit News Boosler*

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council" —Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association"

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates"

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

CHICAGO

The 226th meeting of the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held January 15, 1935, at the University of Illinois College of Pharmacy

The speakers of the evening were, Dr D L Tabern, Research Chemist, and H C Struth, Pharmacologist, of the Abbott Laboratories They discussed "Recent Developments in Hypnotics"

Dr Tabern gave a short history of the development of the barbiturates and their increased use The barbiturates were classed as a veritable gold mine for the organic chemists They are of interest to the physician and pharmacist, the speaker pointed out that they are being used so much to day and there are many with different actions

Lantern slides were shown and Dr Tabern discussed the chemistry of such well known barbiturates as Ipral, Allonal, Dial, Neonol, Amytal, Evipal, Nembutal, Pernocton, Ortol, Phenobarital and Barbital, showing the effects caused by changing and adding chemical groups to the basic formula About 95% of these are given orally, others are given hypodermically or rectally

Mention was made of combining the barbiturates with amidopyrine, of marketing them in cough syrups to take the place of eodeme and used in conjunction with ephedrine

Mr Struth took up the discussion at this point and outlined the methods of calculating the sleep producing power of barbiturates

Albino rats are injected subcutaneously with the sodium salt of the compound The minimum lethal dose and minimum effective dose is determined Sleep in these experiments is taken as the stage where tickling in the ear with a small prod will produce no effect These results are not taken as a clinical parallel, but only as a guide

Albino rats were injected and the tests were run by Mr Struth as a practical demonstration for the large group assembled

Dr Tabern resumed the discussion showing charts giving a graphic comparison of the minimum lethal dose, minimum effective dose and safety margins of the popular barbiturates The comparisons were made with barbital and a chart was also shown that compared the length of drug duration

Mr Struth took up the discussion and demonstration at this time and injected three rabbits intravenously with the sodium salts of barbital, evipal and nembutal

A discussion relative to the elimination of the compounds showed that some are eliminated unchanged in the urine while others are detoxified in the liver No damaging effects on the liver have been reported at this time

At the close, the practical uses of the barbiturates were outlined Phenobarbital was named a specific for epilepsy, a property peculiar unto itself Other uses of the compounds mentioned were, as an antidote for strychnine poisoning, as an antidote for local anesthetics such as

cocaine, as a hypnotic, in rare cases as a general anesthetic and for pre medication for a general anesthesia

LAWRENCE TEMPLETON, *Secretary*

NEW YORK

The January meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on the evening of January 14, 1935, in the College of Pharmacy, Columbia University. About thirty members and their guests attended.

The meeting was called to order by President Ballard and the report of the secretary was read and approved. The treasurer's report showed a balance.

The secretary reported that the application of Mr. Harry Kaye for membership in the AMERICAN PHARMACEUTICAL ASSOCIATION had been forwarded to Secretary Kelly.

Chairman Schaefer, of the Committee for the Fischelis Dinner presented his report giving a complete outline of all disbursements and receipts. His report appears in the files of the secretary and showed a net surplus of \$2.79. Dr. Ballard thanked Dr. Schaefer on behalf of the New York Branch for the fine service he had rendered in managing so successful a testimonial dinner for Dr. Robert P. Fischelis. Dr. Bilhuber made a motion expressing the thanks of the Branch to Dr. Schaefer. The motion was seconded by Mr. Steiger.

Chairman Lehman, of the Committee on Education and Legislation, then reported the following:

'Beginning January 9, 1935, the National Industrial Recovery Board has been holding hearings on the question of 'Price Fixing' as exemplified in various Retail Codes. The outcome is awaited with great interest and anxiety, especially by the retail drug trade.

'The General Wholesale Code Authority started its meetings at the Mayflower Hotel on January 8, 1935 in reference to amendments to the codes and adoption of codes for industries not coded. The Wholesale Drug trade was not included in this hearing.

'The Federal Alcohol Control Administration is seriously considering the interpretation of the Distillers' Code which will have the effect of limiting the sale of alcohol to the retail druggists in glass containers not exceeding 1 gallon, such containers not to be used a second time. This is objected to by the representatives of the Retail Drug Trade as it will add considerably to the cost, not only of the alcohol but of the preparations made therefrom especially in New York State, where alcohol can only be sold to the public on a physician's prescription.

'On January 4th, Senator Copeland introduced S. 5, a bill superseding the Tugwell Bill S. 2800, and said to require formula disclosure or filing the formula with the Secretary of Agriculture. Therapeutic claims are to be substantiated by competent medical authorities in every particular, the bill empowers the Secretary of Agriculture to make regulations having the force and effect of law. In the case of habit-forming drugs it empowers the Secretary to determine what drugs are habit-forming. Cosmetics are included with articles of food and drugs in the bill.

"Representative Treadway will introduce early in the session a bill calling for a 2 1/2% manufacturers sales tax. This tax will no doubt be passed on to the long suffering retailer in pyramided form, and should be opposed by the drug trade.

'The Bureau of Narcotics is endeavoring to have introduced in some thirty-six states the uniform Narcotic Law, similar to the Harrison Act and the New York State Narcotic law.

"The Retail Drug Code Budget has been approved, with appropriate provision for the federal and local authorities. In New York City collections have begun \$1.00 for every registered person employed or non registered if employed in the drug department for 60 hours or more weekly. Payment is mandatory.

"News from Albany indicates that a bill is to be introduced which will provide that all restaurants in drug stores must be enclosed in a separate room."

Mr. Lehman was then called upon to present his report as chairman of the Committee on Nominations. This report was as follows:

"To the members of the New York Branch of the American Pharmaceutical Association—

"Your committee on nominations begs to submit the following nominees for office for the year 1935: *President*, Charles W. Ballard, *Vice-President*, Frederick C. A. Schaefer, *Secretary*, Rudolf O. Hauck, *Treasurer*, Turner F. Currens, *Committee Chairman*, On Audit, Ernst A.

Bilhuber, *Education and Legislation*, Robert S Lehman, *Membership*, Cosmo Ligorio, *Professional Relations*, James H Kidder, *Progress of Pharmacy*, Leonard W Steiger, *Secretary*, *Remington Medal Committee* and *Delegate to the House of Delegates*, Hugo H Schaefer

(Signed) { ROBERT S LEHMAN
ERNST A BILHUBER
LEWIS N BROWN

Following the reading of this report, Dr Schaefer moved that it be received, seconded President Ballard then called upon Dr Schaefer to take the chair during the election Mr Dworkin moved that the secretary cast one ballot unanimously electing the nominees, seconded and approved The secretary cast the ballot accordingly

Dr Ballard then resumed charge of the meeting and expressed his thanks

The application of Mr Edward A Wickam for membership in the New York Branch was received and approved

Before introducing the speaker of the evening, President Ballard called attention to the unfortunate circumstance that midterm examinations were being held in the College of Pharmacy this week and that another meeting was to take place the following night This combination of circumstances had adversely affected the usually good attendance and the president expressed regret to the speaker that more members were not present

President Ballard then introduced William A Lott of the Research Laboratories of E R Squibb & Sons, Inc

Mr Lott spoke on the 'Rational of Chemo-Physiological Research' He began by pointing out the intensive research conducted before a new chemotherapeutic agent is put on the market He called attention to the three prime requisites of a satisfactory product *First* that it have high activity, *secondly* low toxicity, and *thirdly*, no pernicious or undesirable effects From the theoretical viewpoint, he indicated that progress had been made in determining what chemical groups were responsible for particular physiological actions In this regard considerable work had been done in the research laboratories He then discussed some of the open chain hydrocarbons of both the saturated and unsaturated series and indicated how the narcotic power increased with increasing molecular weight

He spoke of the influence of the substitutions of the OH-groups Passing on to the compounds of the aromatic series he explained the influence of the phenyl groups and aromatic amines, and closed with a presentation of a theory of narcotics which had been more recently developed

A rising vote of thanks was accorded the speaker

RUDOLF O HAUCK, *Secretary*

NORTHERN NEW JERSEY

The regular January meeting of the Northern New Jersey Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Rutgers University College of Pharmacy, Newark on Monday evening, January 21st, with President Ernest A Little presiding

William L Sampson assistant professor of Biochemistry, Rutgers University College of Pharmacy, and member of the staff of the Merck Institute of Therapeutic Research, addressed the members of the branch on the subject of ascorbic acid The speaker traced the early history of the disease of scurvy among sailors on long sea voyages, soldiers campaigning in foreign lands, prisoners confined in jails, and even the populace of the larger cities of the world He told how investigators as early as 1752 found that scurvy was due to a dietary deficiency and could only be cured by the addition of fresh vegetables and fruits to the diet Bringing the study down to the present day, Professor Sampson outlined the research which led to the isolation of the principle contained in fresh vegetables and fruits which cured scurvy and its natural and synthetic production in suitable form for medicinal use

Professor George C Schicks presented the report of the Committee on Professional Relations in which he outlined the work being carried on by a joint committee composed of the Committee on Medical Practice of the Medical Society of New Jersey and the Committee on Professional Relations of the New Jersey Pharmaceutical Association which has as its goal the publication of a New Jersey Formulary

The meeting was well attended and members joined in the discussion of the committee reports and the address of Professor Sampson

C L Cox, *Secretary*

PHILADELPHIA

The December meeting of the Philadelphia Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Philadelphia College of Pharmacy and Science on Tuesday evening, December 11, 1934

The minutes of the previous meeting were read and approved, and President Barol introduced Dr Arno Viehoveer, Research Professor of Biology at the College, as the speaker

His topic concerned the action of organic cathartics and recent developments in standardizing their activity A micro projection of a living daphnia was shown with the intestine and glands impregnated with a vital stain, facilitating the study of these organs

Graphic formulas for substances such as Emodin, chrysophanic acid and aloë emodin were placed on the blackboard, and an explanation made concerning the difficulty of chemical analysis of them Dr Viehoveer then presented a series of graphs showing quantitatively the effect of aloin and aloin residue on the intestinal activity of the daphnia, stating that positive quantitative results were obtained A moving picture of the progressive activity of a solution of cascara sagrada showed the laxative effect on the daphnia

Dr Viehoveer gave brief explanations of the effects on dogs and daphnia of the following drugs Aloin, cascara, senna rhubarb and podophyllum The effect of the toxic substances in podophyllum was demonstrated

Experiments showing the relative amounts of mucilage released from cathartic drugs, such as psyllium seeds and certain patented mucilaginous cathartics, were performed

At the close of the lecture Dr Viehoveer showed lantern slides of former workers in biological subjects and suggested that their work should be checked and verified instead of taking their discoveries as facts

E H MacLAUGHLIN, *Secretary*

Pharmacist John Cameron, member of the AMERICAN PHARMACEUTICAL ASSOCIATION favored us with a copy of the Formulary published by the Committee on the Hospital of the Peiping Union Medical College The Formulary consists for the most part of drugs and preparations official in the Chinese Pharmacopœia or contained in the "New and Nonofficial Remedies" It is a book of 70 pages

Left—Prescription balance, Right—containers, mortars, show globe, from Apothecaries Hall, New Haven, Conn

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1934-1935

Office of the Secretary, 2215 Constitution Ave , Washington, D C

LETTER NO 11

January 18, 1935

To the Members of the Council

54 *Committee on Maintenance* In accordance with Motion No 6 (Council Letters No 6, page 1149, and No 7, page 1244) the note for \$40,000 00 held by the Maryland Trust Company was paid in full on December 31 1934

55 *Contract for Printing, Binding and Distribution of the Year Book, Volume 22* Motion No 14 (Council Letter No 8, page 1246) has been carried and the contract has been awarded to the Lord Baltimore Press, Baltimore, Md

56 *Contract for Printing and Mailing the Journal of the A Ph A for 1935* Motion No 17 (Council Letter No 10 page 66) has been carried and the contract has been awarded to the Mack Printing Company, Easton, Penna

57 *Use of Text of the N F* Motion No 15 (Council Letter No 8, page 1246) has been carried and the J B Lippincott Company have been advised

58 *Budget for 1935* Motion No 18 (Council Letter No 10, page 68) has been carried and the budget for 1935 is approved

59 *Selection of Auditors* Motion No 19 (Council Letter No 10, page 68) has been carried and W A Johnson & Co have been employed to audit the accounts of the Association for 1934

60 *Appropriation for Maintenance of Building for 1934* In submitting the budget for 1934, it was stated that the expenses of maintenance could not be estimated and the budget carried \$1800 00 In submitting the budget for 1935, it was stated that as soon as the expenses for maintenance for the year were known a motion to increase this appropriation would be submitted, in accordance with Article II of Chapter II of the By-Laws of the Council The expenses have totaled \$3227 29

(Motion No 21) *It is moved by Kelly that the appropriation for the maintenance of the Building for 1934 be increased to \$3300 00*

61 *Headquarters for the 1935 Meeting* See Council Letters No 4, page 945, and No 6, page 1150

Local Secretary Mickelson has advised that the Idaho Pharmaceutical Association has decided to join with the Oregon and Washington Associations in holding their annual meetings for 1935 in Portland, and on Monday and Tuesday of the week of the A Ph A meeting

The following is quoted from his letter

"I am very pleased to inform you that plans and arrangements for the 1935 meeting at Portland, Oregon, in my opinion, have been arranged very satisfactorily

"A meeting of the A Ph A Branch was held at the College on December 4th and it was unanimously voted that the A Ph A Branch assume all responsibility of financing the national convention On Wednesday, December 5th a joint meeting was held with the Oregon State Pharmaceutical Association Portland Retail Drug Association and the A Ph A Branch During this meeting it was decided that the tri state convention members namely, Oregon, Washington and Idaho, would officially close their meeting Tuesday evening in time to join with the A Ph A and hold a joint banquet and dance This should be an ideal arrangement for our convention Undoubtedly a number of retail pharmacists attending our banquet and dance will remain for the remaining meetings of the convention Buyer's Week will in no way interfere with our meeting This leaves the remainder of the week from Tuesday to Saturday free for business and activity for A Ph A members

"It was unanimously voted that the convention dates be set for the week of August 5th to 10th, inclusive, and I hope that this will meet with the approval of your Council

"I was given the authority to appoint a convention committee to take charge of A Ph A arrangements The following members were appointed George L Haack, Chairman, F C Felter Publicity Chairman, Frank Nau, Earl Gunther, Edgar Stipe, Fred Geue, Treasurer, and Fred Grill This committee met at the

Multnomah Hotel, December 7th and we wish to recommend that the Multnomah Hotel be chosen as Headquarters for our 83rd annual meeting. The hotel management assured us of every hospitality, good food and coöperation in every way possible to make our convention a success. In other words, the hotel is really turned over to A Ph A activities during that week. The arrangement of the Hotel on the mezzanine floor is ideal for convention meetings. Aside from this, the Multnomah has a banquet hall which is suitable for six hundred guests and in an emergency, one thousand.

"The enthusiasm of our convention seems to have regained the momentum it lost for a while, and I feel confident that the A Ph A has a real reception in store.

"It is also planned to appoint state auxiliary committees from Washington, Idaho, Oregon, Montana and California. The purpose of these auxiliary committees will be to stimulate interest in our convention and to get additional members for our association."

(Motion No 22) It is moved by Kelly that the Hotel Multnomah, Portland, Oregon be approved as the headquarters for the 1935 meeting of the A Ph A

62 *Time of the 1935 Meeting* It will be noted that parts of Local Secretary Mickelsen's letter as quoted above, refer to the time of the meeting.

Only two letters were received in response to the request for comments or suggestions with respect to the time of meeting, as made in Council Letter No 4, page 945, and these were not quoted earlier pending the receipt of the final recommendation from the Local Committee.

The following quotations are from a letter from President Fischels:

"I think it is important for the Council to give consideration to the following points in deciding upon the time of the meeting.

"Are we interested in well attended meetings of the AMERICAN PHARMACEUTICAL ASSOCIATION, or do we merely want a crowd? I ask this question because past experience will show that on Monday and Tuesday of the convention week members of faculties of Colleges of Pharmacy and members of Boards of Pharmacy are

in attendance in large numbers. Tuesday night of the convention week is the high point in attendance. Beginning Wednesday, members of Boards of Pharmacy and College faculties start to leave, and by Friday a mere handful of persons is in attendance at the most important sessions of the AMERICAN PHARMACEUTICAL ASSOCIATION.

"The Buyers' Week will undoubtedly attract a great many retail druggists to Portland as will also the meetings of the State associations which are scheduled for Monday and Tuesday. Under the proposed arrangement you will add to the heaviest days of the convention week additional attendance of members of the State associations and those who are coming for the Buyers' Week. It will look like a tremendous convention on Monday, Tuesday and Wednesday. On Thursday and Friday, when the main business of the Association is conducted, you will have only the old standbys to rely on.

"Of course, if all of the members of the State associations scheduled to meet on Monday and Tuesday were members of the AMERICAN PHARMACEUTICAL ASSOCIATION, the situation might be different. What will happen on Monday and Tuesday is that some members of the State associations will drift into the meetings of the American Association of Colleges of Pharmacy or of the National Association of Boards of Pharmacy, thinking that they are meetings of the AMERICAN PHARMACEUTICAL ASSOCIATION, and they will be very much disappointed in the discussion which they will hear because the chances are they will be on technical matters in which the average retail druggist has little or no interest. On the strength of this these retailers will decide that it is useless to stay over for the balance of the week.

"We all know that meetings of the AMERICAN PHARMACEUTICAL ASSOCIATION are already overcrowded with respect to events and specialized meetings, and considerably undermanned with respect to attendance.

"Unless there is a much better reason than the mere presence of a large number of people milling around in the headquarters hotel, I would strongly urge the selection of the week of August 12th in preference to the week of August 5th."

Mr Philip wrote as follows

"Reviewing the letter received from Dean Mickelsen of Portland, Oregon, and thinking over other information received concerning Buyers' Week which is to be held in Portland during the week of August 5, 1935, one of the weeks contemplated by the AMERICAN PHARMACEUTICAL ASSOCIATION officials to hold their annual Convention in Portland, I think that the ASSOCIATION meeting will be more successful if the earlier week in August is accepted even though this week would be concurrent with Buyers' Week in that city

It so happens that the University of California opens early in August. If we expect any attendance from that nearby group, a later date in August would conflict with those who are interested in the University of California activities

"I have come to the conclusion that those who attend only part of the Convention are not affected by outside entertainment or special conditions

'If our weekly program were reversed, those people who come to the Convention and stay only Monday and Tuesday, would change their plans and not arrive at the Convention until Thursday and then leave Friday "

(Motion No 23) It is moved by Philip that the week of August 5 to 12, 1935, be approved as the time for the 1935 Meeting

LETTER NO 12

To the Members of the Council

63 *Committee on the Proposed Council on Pharmaceutical Practice* President Fischels has called attention to the omission from *Motion No 16* (Council Letter No 9, page 66) of the recommendation of the Committee (see page 65) that a Council on Pharmaceutical Practice be established. No further comment has been received

A vote is now called for on the motion as follows

(Motion No 24) It is moved by Fischels that the report of the Special Committee on the Proposed Council on Pharmaceutical Practice be received, that the Council approve the establishment of a Council on Pharmaceutical Practice to be conducted under the auspices of the American Pharmaceutical Association with personnel as recommended by the Special Committee and that

the Special Committee be continued for the purpose of developing the plan in conjunction with the Council on Pharmaceutical Practice and report at the Portland meeting

64 *Appropriation for Maintenance of Building for 1934* Motion No 21 (Council Letter No 11, this issue of the JOURNAL) has been carried and the appropriation is increased

65 *Headquarters for the 1935 Meeting* Motion No 22 (Council Letter No 11, this issue of the JOURNAL) has been carried and the Multnomah Hotel is approved as the headquarters

66 *Time for the 1935 Meeting* Motion No 23 (Council Letter No 11, this issue of the JOURNAL) has been carried and the week of August 5th-12th is approved as the time for the meeting

67 *Use of the Text of the N F V* Mr Morris Dauer Ph G, Chief Pharmacist, Kings County Hospital, Brooklyn, N Y, has requested permission to partially reproduce the text of the N F V in a Medical Formulary and Prescription Manual. After correspondence with Mr Dauer as to the extent the text would be reproduced, Chairman DuMez of the Committee on Publications writes

"In response to your letter of the 17th instant, I am pleased to note that Mr Dauer does not intend to publish complete working formulas in his Formulary for Physicians. I, therefore, recommend to the Council that permission be granted Mr Dauer to use portions of the text of the National Formulary in the preparation of his Formulary for Physicians, providing he does not publish complete working formulas, and that permission also be granted for the use of National Formulary titles in the posological table to be included in the book. For this privilege I recommend further that the usual fee of \$5.00 be charged "

(Motion No 25) It is moved by DuMez that permission be granted to Mr Morris Dauer to use the text of the N F V for partial reproduction in his Formulary for Physicians under the usual conditions and at the usual charge of \$5.00

68 *Life Membership* The following became Life Members during 1934 through the payment of dues for 37 consecutive years: William L. Cliffe, Jesse L. Hopkins, Robert S. McKinney and Frank X. Moerk.

The following became Life Members during 1934 through the payment of a fee: Gustav

Bachman, Zada M Cooper, Frank R Eldred, Roland E Krcmers, Henry A Langenhan, Martin Larson, Rufus A Lyman and George S Morgan

69 *Year Books for the Library of Congress*
Dr Herbert Putnam, Librarian of Congress, through the Chief Division of Accessions has requested that the Association donate copies of the YEAR BOOKS, Volumes 1-5, 7-12, 14-21 for the files of the National Library

The request was referred to Dr A G DuMez of the Committee on Publications who writes

"It is stated that it is my personal opinion that a full set of the YEAR BOOKS of the AMERICAN PHARMACEUTICAL ASSOCIATION should be in the Library of Congress, and as most of the books contained in that library have been donated I can see no good reason why the AMERICAN PHARMACEUTICAL ASSOCIATION should not donate

the numbers requested by the Librarian of that institution If my memory serves me correctly, we donated almost a complete set of the YEAR BOOKS to the Creer Library not so long ago, which should serve as a precedent for us to follow in this case"

(Motion No 26) It is moved by Kelly that Volumes 1-5, 7-12, 14-21 of the Year Books of the Association be donated to the Library of Congress A vote on this motion will be called for

70 *Bequest by Dr Frederick B Kilmer*
Newspapers and other publications have carried the statement that the will of Dr Kilmer includes a bequest of \$3000 00 as a trust fund to the AMERICAN PHARMACEUTICAL ASSOCIATION, the income from which is to be applied in the form of a prize, to the rewarding of meritorious work in pharmacognosy So far, no official report has been received

EDITORIAL NOTES

AN UNFORTUNATE ERROR

A patient at the George Washington University Hospital lost her life as a result of administration of formaldehyde. This brief mention of the unfortunate error is made, as statements regarding the occurrence differ. The coroner's jury placed the responsibility for the error on the pharmacist (Miss Blanne Bennet), however, other information differs from the findings. The latter stated that the 5 pound bottle from which she poured the solution was new and bore a paraldehyde label. Another patient in the same section suffered from the same poisoning, but recovered.

PUBLIC HEALTH PROFESSORSHIP

The first professorship in public health has been established in the University of Munich. Professor Dr. Schultze, the new state commissioner for public health in Bavaria, has been appointed lecturer. In his inaugural he pointed out first the negative side of his professorship, namely, combating the errors in medicine due to specialization. The problems of the new discipline in science are, as he stated, racial supervision, dwelling and colonization problems, social insurance and determination of the useful in folk remedies, the single great objective being that public health is political power.

IMPERIAL BOTANICAL CONFERENCE

An Imperial Botanical Conference, commencing on August 28th and lasting two or three days, will be held in London this year. The subjects set down for discussion are of general interest to Empire botanists. The *Kew Bulletin*, in announcing the Conference, hopes that it will furnish a convenient meeting ground for home and overseas botanists who are on their way to attend the International Botanical Congress which meets at Amsterdam in the week following. The Director of the Royal Botanic Gardens, Kew, is the chairman of the Organizing Committee of the Conference, and the honorary secretary is Professor W. Brown. Imperial College of Science and Technology, South Kensington London, S W 7, from whom further particulars may be obtained.

FOURTH INTERNATIONAL HOSPITAL CONGRESS IN ROME

The International Hospital Association an-

nounces that the fourth International Hospital Congress will take place in Rome from May 5-12, 1935. The Italian Government has extended a most cordial welcome to the Association, so that the visit to Rome is assured of being a most memorable one in every respect. The full program, giving all details of the Congress and of the study trips which will take place before and after the Congress, will be issued within a few weeks. The International Hospital Association requests government health departments, national associations and the press to give publicity to the Congress and to encourage a large attendance. The Association also expresses the hope that all who are interested in its work will endeavor to fit the Congress into their program of travel for 1935.

VACATION COURSES OF THE UNIVERSITY OF HEIDELBERG

The University of Heidelberg has provided vacation courses for those from foreign countries who desire to take part in one or the other of these special courses.

AUSTRIAN PHARMACEUTICAL SOCIETY

The Austrian Pharmaceutical Society held its annual session in its building in Vienna. The usual order of business was carried out. Among the addresses was one by Professor Dr. H. Mark. The secretary of the organization is Dr. Hans Heger and the honorary president is Dr. Richard Furbas.

CENTENNIAL CELEBRATION AT TULANE

The one hundredth anniversary of the establishment of Tulane University of Louisiana School of Medicine, New Orleans, was commemorated in a program sponsored by the Orleans Parish Medical Society, January 7th. This observance is a forerunner of the celebration planned by the University in June for three or four days, culminating on commencement day, June 12th. The recent program marked the actual day of its founding, the first Monday in January, 1835. The history of the institution was reviewed by Mayor T. Semmes Walmsley, and Drs. Charles C. Bass, dean, Waldemar R. Metz, Albert E. Fossier and Randolph Matas.

PERSONAL AND NEWS ITEMS.

THIRTIETH ANNIVERSARY OF THE
COUNCIL ON PHARMACY AND
CHEMISTRY

On February 11th, the Council on Pharmacy and Chemistry completed its thirtieth year of service. During the greater part of this period, our late fellow member, W. A. Puckner, served as its secretary. The present secretary of the Council is Dr. Paul Nicholas Lecch, a member of the AMERICAN PHARMACEUTICAL ASSOCIATION. President R. P. Fischelis sent a congratulatory telegram to the American Medical Association.

TWEIFTH INTERNATIONAL CON-
GRESS OF PHARMACY

The 12th International Congress of Pharmacy is to be held in Brussels July 30th, to August 5, 1935, under the auspices of the International Pharmaceutical Federation, Belgium Pharmaceutical Association and the Pharmaceutical Society of Anvers. Pharmacist J. Bruegelmans of Brussels, *Secretary*, states that an invitation has been extended to the U. S. Government to be represented and pharmacists of the United States are invited. Further information will later be mailed. The *JOURNAL* Entertainment features and plans for visitations have been arranged. Those contemplating to attend should address Dr. J. Bruegelmans, General Secretary, 3 rue du Gouvernement Provisoire, Brussels, Belgium. Further information will be given in a succeeding number of the *JOURNAL*.

BULLETIN OF THE INTERNATIONAL
FEDERATION

The number of the *Bulletin* issued December 28, 1934, contains reports of the Committee on Specialties, information relative to the Pharmaceutical Congress to be held in Brussels in 1935. Regulations governing the Practice of Pharmacy in various countries—Belgium, Czechoslovakia, Egypt, Great Britain, Hungary, Netherlands, Poland, United States, Spain, Sweden, Bucharest, Rumania. An article by Col. J. Thomann, of Berne, discusses Military Pharmacy, another is devoted to the Centenary of Dr. Charles Davilla. The number concludes with rosters of pharmaceutical activities in Germany, United States, Belgium, Finland, France, Great Britain,

Hungary, Latvia, Luxemburg, Netherlands, Sweden, Switzerland and Czechoslovakia.

Secretary General J. Bruegelmans and Secretary T. Potjewijd have made a very valuable contribution by the publication of this number of the *Bulletin of the International Pharmaceutical Federation*.

John P. Jelinek, of St. Paul, is completing his second year as president of the Northwest Pharmaceutical Bureau under whose auspices the Northwest Drug Show is held annually. Mr. Jelinek will conduct the bureau conference at a 6 o'clock dinner, Wednesday, February 20th.

Miss Mary A. Fein, of Little Rock, Ark., has a record of long service as secretary of Arkansas Pharmaceutical Association. The 25th anniversary of her incumbency received wide recognition from pharmacists and State pharmaceutical associations. While no longer secretary, her interest in pharmacy continues and she is a frequent visitor to adjoining State associations and is an occasional visitor at meetings of the AMERICAN PHARMACEUTICAL ASSOCIATION.

Her service was given publicity after the election of Miss Alice Garvin to succeed her lamented father, Patrick J. Garvin.

Charles H. LaWall is on the program for an address on Pharmacy and Early Pharmacy, to be delivered at the Widener Branch of Free Library, Philadelphia.

Paul C. Olsen has recently completed a careful factual study of the results of stabilization in a typical retail drug store. We enclose a mimeograph copy of his report which he has just handed to us. Dr. Olsen advises that he is working up similar studies on the results obtained in other typical stores.

It would appear from this study by Olsen and a few other critical researches that have been conducted, that there is a whole lot more to say in favor of stabilization to day than ever before.

Frederick W. Connolly, Boston, Mass., has presented to the AMERICAN PHARMACEUTICAL ASSOCIATION a formulary of the London Hospital for the treatment of skin diseases. The staff of the hospital includes a pharmacist, the year of issuance is 1850.

OBITUARY

CHARLES M BLANEY

Charles M Blaney, member of the AMERICAN PHARMACEUTICAL ASSOCIATION, and a retired pharmacist of Baltimore, died January 16th, aged fifty-six years. After his retirement Mr Blaney gave much of his time to aiding others in various pharmaceutical activities. He contributed toward the Headquarters fund and after the building was completed donated a number of articles for the Museum.

Mr Blaney was a member of the Maryland Pharmaceutical Association of the Baltimore Retail Druggists' Association, and the Veteran Druggists' Association. He was deeply interested in the U S P and N F revision work.

The Baltimore Veteran Druggists' Association attended the funeral in a body.

W L CLIFFE

William L Cliffe, member of the AMERICAN PHARMACEUTICAL ASSOCIATION and active in pharmaceutical affairs, both national and state, died suddenly, February 4th, at his home in Frankford, Pa (Philadelphia). After completing his early school education he was apprenticed with F H Basset in Frankford. In 1882, he matriculated at the Philadelphia College of Pharmacy and graduated in 1884, after graduation he engaged in business on his own account at Kensington Avenue and Somerset Street.

Mr Cliffe took a leading part in college activities and served the Alumni Association as president and in other offices, and the college as a member of its board of trustees and active on its committee of instruction and of education, rendering most valuable service.

He was a former president of Pennsylvania Pharmaceutical Association, a member of the State Board of Pharmacy and a former vice president of the AMERICAN PHARMACEUTICAL ASSOCIATION. He had a part in all of these organizations in their efforts for promoting pharmacy. The writer, a classmate, valued his friendship highly.

The deceased is survived by his widow.

EDGAR A RIDGELY

Edgar A Ridgely, president of the Indiana Pharmaceutical Association, died January 24, 1935, following an attack of Angina pectoris. Mr Ridgely was attending a testimonial dinner to a fellow-member, E C Went, newly elected Mayor of Mishawaka. Mr Ridgely was scheduled as one of the speakers of the occasion presided over by Harry Noel as toastmaster.

Mr Ridgely was born near Olney, in Southern Illinois, where he received his early education and later attended the Southern Collegiate Institute at Albion, from which institution he graduated. After teaching for several years he matriculated at Valparaiso University, from where he graduated in 1902. After graduation he served for a time as drug clerk and then entered business on his own account in East St. Louis. He afterward located in Gary, Indiana.

Mr Ridgely was interested in civic affairs and active in Indiana Pharmaceutical Association of which he was elected president last year. Mr Ridgely was 56 years of age and is survived by his widow and three daughters.

E D IRVINE

Ephraim Dinsmore Irvine, honorary member of the Illinois Pharmaceutical Association for many years, and editor and publisher of the *Western Druggist*, afterward known as the *Drug Bulletin*, died at his home in Oak Park, Sunday January 27th, at the age of 68. Mr Irvine was graduated from the Chicago College of Pharmacy in 1893 as an honor student and was president of his class. He was for a time engaged in the drug business in North Dakota but returned to Chicago and became a member of the teaching staff of the college, as assistant to Professor Hallberg. Shortly afterward he joined the *Western Druggist* staff and upon the death of G P Engelhard succeeded to the editorship and ownership of that journal. He has been a member of the Chicago Veteran Druggists' Association since 1920. He leaves a wife and daughter. The funeral services were held at the family residence 725 Clinton Street, Oak Park, and the members of the Chicago Veteran Druggists Association attended in a body—
WM B DAY, Dean

SOCIETIES AND COLLEGES

EIGHTY-THIRD ANNUAL MEETING
AMERICAN PHARMACEUTICAL
ASSOCIATION AND AFFILIATED
ORGANIZATIONS

The Council of the AMERICAN PHARMACEUTICAL ASSOCIATION has approved the week of August 5th to 10th as the time and the Hotel Multnomah, Portland, Ore., as the headquarters for the 1935 meeting.

The North Pacific Branch of the A P H A will have direct charge of arrangements for the meeting under the supervision of Local Secretary Dean A O Mickelsen, North Pacific College of Pharmacy, Portland, and with the active cooperation of committees representing the pharmacists of Oregon, Washington, Idaho, California and Montana. This is the first time that the A P H A has met in this section and every effort is being exerted to make it an outstanding event.

The pharmaceutical associations of Oregon, Washington and Idaho will hold their annual meetings, jointly, in Portland on Monday and Tuesday, August 5th and 6th, which will add greatly to the interest and attendance at this unusual pharmaceutical gathering.

The Plant Science Seminar and the National Conference on Pharmaceutical Research will hold their annual meetings the previous week, the latter on Saturday, August 3rd. The National Association Boards of Pharmacy and the American Association Colleges of Pharmacy will hold their annual meetings, as usual, on Monday and Tuesday, August 5th and 6th.

A joint banquet for all groups including those attending the state association meetings, is scheduled for Tuesday evening, August 6th.

The sessions of the A P H A, including those of the Conference of Pharmaceutical Association Secretaries and of the Conference of Pharmaceutical Law Enforcement Officials will occupy Wednesday, Thursday and Friday, closing Friday evening.

On Saturday, all visitors will be taken on an all day trip by bus, over the famous Columbia River Highway during which an out-door luncheon will be served. Other entertainment features will be scheduled during the week and every opportunity provided to see the many unusual points of interest in this wonderful section of our country.

The arrangements for the various business sessions and the entertainment features will be announced as they are completed in a series

of news bulletins to be issued by the Committee on Publicity.

The American Chemical Society will hold its summer meeting in San Francisco during the week of August 19th, which will be very convenient for those who wish to also attend this meeting with a week in between to sightsee.

Portland has ample hotel facilities for the convention. The Hotel Multnomah will be given over to the business sessions and entertainment of the delegates and visitors to the A P H A and related organizations. The headquarters of the state associations will be located in other hotels within easy access to the Multnomah so that visiting will be easy.

The Committee on Transportation of the A P H A will soon have an important announcement in reference to rates and time. The certificate plan will not be necessary because of the unusually low round trip or single rates including choice of routes and full stop over privileges. A variety of interesting side-trips will be offered at low cost. Parties to travel together are being made up in various centers and special train accommodations will be offered from Chicago and other points.

The automobile roads are excellent and the accommodations for those who prefer to travel this way are fine. Many scenic attractions can be visited by automobile more conveniently and a diversity of routes is available.

This annual meeting will be an exceptional one from the standpoint of program and attendance. A very interesting section of our country can be seen with every convenience and at reasonable cost and during the most favorable period of the year. The annual meetings of the three state associations will provide the unusual opportunity of meeting the pharmacists of this entire section.

SECTION AND CONFERENCE PAPERS
FOR THE PORTLAND MEETING OF
THE AMERICAN PHARMACEUTICAL
ASSOCIATIONS

The time is approaching for preparing papers and reports for the Portland meeting. The list of officers may be found in the roster, for your convenience the names of the presiding officers and secretaries are here given. Scientific Section, *Chairman*, E V Lynn, Massachusetts College of Pharmacy, Boston, *Secretary*, F E Bibbins, 5840 Washington Blvd., Indianapolis Ind. Section on Education and

Legislation, *Chairman*, Oscar E Russell 531 So Main St, Elkhart, Ind, *Secretary*, L W Rising, University of Washington, Seattle, Wash Section on Practical Pharmacy and Dispensing, *Chairman*, H M Burlage University of North Carolina, Chapel Hill, N C, *Secretary*, Leon W Richards, University of Montana, Missoula, Mont Section on Commercial Interests, *Chairman*, Henry Brown, Scranton, Pa, *Secretary*, R T Lakey, Cass & Hancock Aves, Detroit, Mich Section on Historical Pharmacy, *Chairman* C O Lee, Purdue University, La Fayette, Ind, *Secretary*, H W Youngken, Massachusetts College of Pharmacy, Boston, Mass, *Historian*, E G Eberle, 2215 Constitution Ave, Washington, D C

National Conference on Pharmaceutical Research, *Chairman* E N Gathercoal 710 So Wood St, Chicago, Ill, *Secretary*, John C Krantz, Jr, 2411 No Charles St, Baltimore, Md Conference of Pharmaceutical Association Secretaries, *President*, F V McCullough, New Albany, Ind, *Secretary*, Carl G A Harring, 20 Glen Road, Newton Center, Mass Conference Pharmaceutical Law Enforcement Officials, *Chairman*, R L Swain, 2411 No Charles St, Baltimore Md *Secretary* M N Ford, New State Office Building, Columbus, Ohio Plant Science Seminar, *Chairman*, Frank H Eby, 240 Powell Road, Springfield, Pa, *Secretary*, F J Bacon, Western Reserve University Cleveland, Ohio

National Association of Boards of Pharmacy, *President*, C H Evans, Warrenton, Ga, *Secretary*, H C Christensen, 130 No Wells St Chicago Ill

SECTION ON HISTORICAL PHARMACY

'The officers of the Historical Section earnestly solicit the cooperation of all members and friends of the AMERICAN PHARMACEUTICAL ASSOCIATION as they begin their work in preparation for the historical program for the annual convention of the Association in Portland Oregon

"Our ASSOCIATION has not met in the far west for a number of years and we are anxious to carry a renewed appreciation of the glorious art of the Apothecary of the past into this section

"Modern Pharmacy has been built upon the past and every phase of pharmacy which has transpired, although but recently, is history The stories of drug stores, pharmaceutical manufacturing houses, local or state associations, men and institutions of pharmacy are all within the realm of history Send us the titles and abstracts of your stories at your earliest convenience You are invited to contribute to the Archives of American Pharmacy now housed in the AMERICAN INSTITUTE OF PHARMACY in Washington, D C—HEBER W YOUNGKEN, *Secretary*

PHI DELTA CHI FRATERNITY

The annual meeting of the Grand Council of Phi Delta Chi was held in Baltimore, at the Emerson Hotel, February 7th and 8th

The gala event of the conclave was the Annual Banquet, held February 8th After the close of the conclave many of the fraters visited the AMERICAN INSTITUTE OF PHARMACY

AMERICAN DRUG MANUFACTURERS' ASSOCIATION

Plans for the twenty fourth annual meeting of the American Drug Manufacturers' Association at Hot Springs, Va, May 6th to 9th are in preparation The schedule of sessions places the first general session on May 7th, sessions of the biological, crude drug pharmaceutical and scientific sections will start May 6th The annual dinner is scheduled for May 8th

In his first call for the meeting President A Homer Smith says

This year general and specific problems of unprecedented magnitude have confronted the industry Many of these will be still pending when we assemble at The Homestead There is no better way to approach a satisfactory solution of these pressing issues than through an interchange of ideas on the floor of the convention and through personal contacts It is therefore urged in the interest of all concerned that every member firm arrange now to have present a representative delegation of their technical and business staffs I shall be most grateful for your assurances to this end"

DRUG AND CHEMICAL DINNER

Eight hundred reservations for the tenth annual dinner of the drug, chemical and allied trades to be held March 21st in the Waldorf Astoria New York City, have been received by the Drug, Chemical and Allied Trades section of the New York Board of Trade, which organization sponsors the dinner

NORTH CAROLINA PHARMACEUTICAL ASSOCIATION

The meeting date of North Carolina Pharmaceutical Association has been fixed for May 13th-15th, in the Robert E Lee Hotel as convention headquarters, Winston-Salem. Sam C Welfare and M T Lesley have been named Local Secretary and Assistant Local Secretary.

NEBRASKA PHARMACEUTICAL ASSOCIATION

Nebraska will hold the fifty-fourth annual convention at the Hotel Cornhusker, Lincoln, February 25th-28th. Many problems of legislation will be discussed and decided. Speakers of prominence are named on the program.

MAINE PHARMACEUTICAL ASSOCIATION

It was voted to hold the Annual Convention at the Rangeley Lakes House, Rangeley, Me., on June 25-28, 1935. The Mid-Winter meeting was held in Augusta, Friday, February 15, 1935.

A suggestion of forming a Council of Pharmacy, in which every section of the State will be represented, was accepted and the Executive Committee will proceed at once to get the Council organized and ready to function. The purpose of this Council of Pharmacy is to create more interest in Pharmacy in the State, and to create a better spirit of cooperation among the Druggists of the State. The tentative plan for the organization of the Council of Pharmacy is for the President, B K Murdock, to appoint two members from each county to form the Council, which is to elect two members to serve on the executive committee of the Maine Pharmaceutical Association.

PUERTO RICO PHARMACEUTICAL ASSOCIATIONS

The Board of Directors of Puerto Pharmaceutical Association is composed of *President*, Alberto Pelegrina, San Juan, *Vice-President*, Candido A Martinez, Caguas, *Secretary Treasurer*, Ramon Lopez Irizarry, San Juan, *Counsellors* Angel M Diaz, Hector Urrutia, Carlos G Gonzalez, Francisco L Anselmi, Antonio Maisonave, Armando Arroyo, Juan T Puig, Zoilo Zotomayor, Francisco Sosa Perez, Raul Acosta, Victoriano Pagan Colon, Enrique Angalde, Luis R Emanuelli, V M Colon.

Members of the State Board of Pharmacy are *President*, Ramon Lopez Irizarry, San

Juan, *Secretary*, Washington Llorens, Arecibo, *Treasurer*, Lumen M Mendez, Larcs, Luis A Torregrosa, San Juan, Sergio Seijo Arecibo.

Report of the Director of the School of Tropical Medicine of the University of Puerto Rico, under the auspices of Columbia University for the year ending June 14, 1934. Published by the University of Puerto Rico and Columbia University, 67 pages.

PROPOSALS AFFECTING PHARMACEUTICAL PROFESSION IN THE PHILIPPINE ISLANDS

Two important proposals which would materially affect the pharmaceutical profession in the Philippine Islands are being studied by the board of pharmaceutical examiners, upon the recommendation of the Philippine Pharmaceutical Association.

The first proposal would confine the practice of pharmacy in the Philippines exclusively to Philippine and American citizens. Its purpose is to nationalize the profession, and protect Philippine pharmacists. This plan, which will be brought before the Legislature, will not however, affect foreign subjects now practicing pharmacy in the Philippines.

The second plan provides that all pharmacy and drug store owners shall be graduates of pharmacy schools. This is in accordance with the system followed abroad, where only regular pharmacists are allowed to own drug stores. It was declared.

On July 25th, the board of pharmaceutical examiners, at its regular monthly meeting, approved the proposal to make the sale of household remedies exclusive to American or Philippine residents who have resided in the Islands at least one year before the filing of application with the board. All applicants should be of good character, should not suffer from contagious diseases, and should have passed prescribed examinations. (Acting Trade Commissioner Carl H Boehringer, Manila.)

The following officers of Philippine Pharmaceutical Association have been elected: *President*, Apolonio R Chaves, *First Vice President*, Alfredo C Santos, *Second Vice President*, José E Jimenez, *Secretary*, Antonio Belmonte, c/o Manila College of Pharmacy, Manila, *Assistant Secretary*, Victorio C Dionisio, *Treasurer*, Pedro C Batallones, *Assistant Treasurer*, Remedios Reynado, *Board of Directors*, Pedro T Maglalang, Petrocino Valenzuela, Florencio Gavino, José V Gloria,

Delfin Santos Ocampo, Antonio G Llamas,
Felipe J Concepcion, Servando de los Angeles

OFFICERS OF THE JAPAN PHARMACISTS' UNION

At the 13th general meeting of the Japan Pharmacists' Union, held January 18th and 19th, in Tokyo, Dr Kametaro Kawai was reelected president, the vice presidents are Kimyiro Ishii and Buro Ogimura. President Kawai considered national health insurance most important and, unless separation of medical and pharmaceutical practice is brought about pharmacists would be seriously affected, because physicians, without such restrictive provision, would supply medicines and cut deeply into the income of pharmacists.

AMERICAN DRUGGISTS' FIRE INSURANCE COMPANY

The annual meeting of the American Druggists' Fire Insurance Co was held February 11th-13th. This was the 30th anniversary of the company, dinner was served at the Cincinnati Club and Dr James H Beal was persuaded to deliver an address on Abraham Lincoln.

The following officers were elected: *President*, Charles H Avery, *Vice-President*, James H Beal, *Secretary and General Counsel*, Frank H Freericks, *Assistant Secretary*, W P Starkey, *Treasurer*, Walter Rothwell, *Assistant Treasurer*, E H Thiesing.

LEGAL AND LEGISLATIVE

THE COPELAND BILL

An amended form of the Copeland bill (S 5) was submitted to the Senate committee on commerce by the chairman, Senator Royal S Copeland, February 13th, and assigned to a sub committee for public hearings, consisting of Senator Bennett Champ Clark, of Missouri, Chairman, Senator Hattie W Caraway, of Arkansas, and Senator Charles L McNary, of Oregon. The sub-committee has not yet set a date for hearings, but has promised that it will give ample notice.

The title of the bill has been changed to read "An Act to prevent the adulteration, misbranding and false advertising of food, drugs and cosmetics in interstate, foreign and other commerce subject to the jurisdiction of the United States, for the purposes of safeguarding the public health and preventing deceit upon the purchasing public."

The variation clause is changed only by striking out two phrases, one covering names which "simulate" those recognized in an official compendium, and the other reading "If it fails to meet the definition and description set forth therein."

The definition of adulterated drugs and cosmetics now includes "If it consists in whole or in part of any filthy, putrid or decomposed substance, or if it has been prepared, packed or held under insanitary conditions whereby it may have become contaminated with filth, or whereby it may have been rendered injurious to health, or if its container is composed

of any poisonous or deleterious substance which may render it injurious to health."

The requirement for "explicit" directions for use has been changed to "adequate" directions for use.

Where the original bill made a drug misbranded "if its name is the same as, or simulates, a name recognized in an official compendium and is not packaged and labeled as described therein," the new language reads "If its name is recognized in an official compendium, or it purports to be a drug the name of which is so recognized."

COMPULSORY SICKNESS INSURANCE OPPOSED BY AMERICAN MEDICAL ASSOCIATION

According to the Press reports of February 16th, the American Medical Association reiterated its vigorous opposition to compulsory sickness insurance plans being studied by the President's Committee on Economic Security. But it tempered its stand by approving projects for setting up systems of voluntary illness insurance on a community basis.

Decrying what it termed attempts to regiment the profession in proposed legislation and attacking certain sections of the Wagner bill embodying the national administration's social security program, the Association's house of delegates adopted a declaration of policy for its 100,000 member physicians.

The report, carried unanimously at the sec-

and extraordinary session in the organization's history, set forth

"The house of delegates of the American Medical Association reaffirms its opposition to all forms of compulsory sickness insurance whether administered by the Federal Government, the governments of the individual States or by any individual industry, community or similar body. It reaffirms also its encouragement to local medical organizations to establish plans for the provision of adequate medical service for all of the people, adjusted to present economic conditions by voluntary budgeting to meet the costs of illness."

The statement pointed out more than 150 plans for medical service were undergoing study and trial in various communities and added:

"Your Bureau of Medical Economics is ready and willing to advise medical societies in the creation and operation of such plans. The plans will serve the people of the community in the prevention of disease, maintenance of health and with curative care in illness. They must meet apparent economic factors and safeguard the medical profession."

"The House of Delegates emphasizes the necessity for separate provision for hospital facilities and physicians' services. Payment for medical service, whether by prepayment plans, instalment purchase or voluntary hospital insurance plans, must hold, as absolutely distinct, remuneration for hospital care on one hand and the individual, personal scientific ministrations of the physician on the other."

The association's trustees were urged to request the Bureau of Medical Economics to "study further plans now existing and developing with special reference to the way in which they meet the needs of their communities, costs of operation, quality of service, effect of such service on the medical profession, the applicability to rural, village, urban and industrial population and to develop for the association's June meeting model plans adapted to the needs of populations of various types."

NRA EXTENSION ASKED BY PRESIDENT ROOSEVELT

President Roosevelt, on February 20th, called on Congress to extend the National Industrial Recovery Act for a period of two years from June 16th.

In a message read to both Houses he declared: "The fundamental purposes and principles of this act are sound. To abandon them is unthinkable. It would spell the return of industrial and labor chaos."

While admitting that there should be amendments to the present law, the President laid down certain specific benefits which, he said, have accrued and which must not be abandoned. He listed among these: the abolition of child labor, the establishment of maximum hours of work and of minimum wages, the right of the workers to collective bargaining and the freeing of industry from dishonorable competition.

HOUSE ELIMINATES HEALTH INSURANCE PROVISION OF THE WAGNER-LEWIS BILL

The House Ways and Means Committee has given consideration to the Wagner-Lewis bill during the past month. An important change was made in eliminating relief insurance from the measure.

Apparently at the request of critics of State medicine the committee deleted from the bill authority for the projected Social Insurance Board to study and recommend legislation to afford economic security through health insurance.

Observers recalled health insurance was not included in the report of the President's economic security committee on which the Wagner-Lewis bill was based.

MARIJUANA

S 53, Montana, to amend the law prohibiting the production, distribution or possession of marijuana, proposes to make a violation of the act a felony, punishable by imprisonment in the penitentiary for from one to five years and/or a fine of from \$500.00 to \$1000.00. A Maryland amendment of the narcotic bill relates to prohibition of marijuana. The statement is made that cigarettes containing the narcotic are sold.

ARKANSAS

Arkansas introduced H 105, apparently to supplement the pharmacy practice act, proposing (1) to define drugs as "any drug or compound listed in the United States Pharmacopoeia or National Formulary, or both, which are used for the prevention, mitigation or cure of disease," (2) "to prohibit the distribution of drugs, as defined, except by registered pharmacists," (3) "to permit the board of pharmacy to enjoin the operation of any store not complying with the pharmacy laws." H 110 and S 67 propose "to repeal the laws regulating the possession and distribution of narcotic drugs and to enact what the drafts-

men of these bills cite as the uniform narcotic drug act " The bills however, differ from the model uniform narcotic drug act in some important particulars and contain obvious errors in phraseology They omit the provisions in the model bill intended to limit the gross quantity of a habit-forming drug a person can buy in exempt preparations within a period of forty eight hours

INDIANA

H 113 proposes "to authorize the state board of pharmacy to appoint a narcotic inspector to enforce and to collect information necessary to enforce, the state and federal laws relating to narcotic drugs " S 83 proposes to repeal the laws regulating the distribution and possession of narcotic drugs and to enact what apparently is the uniform narcotic drug act " S 118 to amend the workmen's compensation act H 211 proposes to authorize counties, cities and towns to supply insulin free of charge to citizens who are in need of insulin treatment for diabetes and who are financially unable to purchase the drug

ARIZONA

H 19, Arizona, proposes to enact a new pharmacy practice act Apparently this bill proposes to prohibit physicians from dispensing drugs and medicines but permits them to administer personally "drugs and medicines carried or kept for emergencies in order to supply the immediate needs of their own patients "

MISSOURI

H 73, Missouri, proposes to forbid the sale or other distribution of acetylsalicylic acid, carbolic acid or iodine except on the prescription of a licensed physician, dentist or veterinarian

MONTANA

S 35, Montana, to supplement the pharmacy practice act, has passed the house, proposing 'to authorize the state board of pharmacy to adopt rules requiring registered pharmacists to keep a record of all poisons sold or disposed of containing the signatures of the purchasers and such other information as may be required by the board "

BOOK NOTICES AND REVIEWS

Toxicologie Moderne A L'Usage des Étudiants en Médecine et en Pharmacie, des Médecins Legistes et des Chimistes Experts By ROGER DOURIS 1935 339 pages, 47 figures Published by Vigot Frères, Paris

Should the pharmacist specialize in toxicology? Conversely, why not? His daily training teaches him much regarding the occurrence properties, reactions, incompatibilities, chemical and pharmaceutical behavior of poisons, and he is required to be familiar with customary antidotes Blyth defined toxicology in the title to his book Poisons Their Effect and Detection " It should be frankly appreciated that the pharmacist is not trained in pathology Therefore, he will not be able to make detailed studies of a pathological nature However, he is very specifically trained in the detection of poisons Professor Douris has prepared a manual not only for medico legal chemists and industrial toxicologists, but also for students of pharmacy and medicine

The book is divided into eight distinct parts The first four chapters discuss general aspects of poisoning, variations in toxicity according to methods of administration, relationship of age and method of administration to effect, trans-

formation within the organism and tabulate a series of antidotes The second part contains fourteen chapters dealing with the method of collecting viscera, tests for the metallic poisons and methods of extraction of organic poisons and alkaloids A brief chapter discusses methods of physiological identification This section closes with a discussion of poisonous gases and corrosives A series of excellent tables indicates the detailed procedures to be followed in separation and identification of inorganic and organic poisons

The third portion gives specific methods to be used in testing for various organic or inorganic poisons, both chemically and by physiological methods, and lists the toxic and the lethal doses of many of these products In this chapter ureides, barbituric acid compounds, glucosides, alkaloids, ptomaines and metallic poisons are discussed in some detail

The fourth section deals with war gases, giving their "nom de guerre" formula, boiling point, physiological action and common adjuvants So far as possible, the toxicity of these products is also recorded The fifth chapter deals with poisons to be sought in examining drinking water The sixth section

discusses the action of bacterial toxins and of mushrooms. The seventh section deals with medico legal identification of blood, sperm, stomach contents, etc., and is followed by a brief discussion of the toxicological reports submitted in the French Courts.

This book supplements information given by Blyth, by Autenrieth and by Peterson, Haines and Webster. It will prove very useful for pharmaceutical reference purposes.—JAMES C. MUNCH

Annual Survey of Research in Pharmacy, 1933-1934 and Proceedings of National Conference on Pharmaceutical Research, 1933-1934. Edited by JOHN C. KRANTZ, JR., Secretary Press of The Jolin D. Lucas Printing Co., Baltimore

Secretary John C. Krantz, Jr., has presented an annual volume which shows his usual care and the research subjects reported speak well for pharmacy. The subjects are arranged in alphabetical order under "Specific Problems" and "General Problems" and the former 228 in number and the latter are listed under Bibliography, Botany and Pharmacognosy, Pharmaceutical Economics, Pharmaceutical Education, Pharmaceutical History, Pharmaceutical Law, Pharmaceutical Publications, Pharmaceutical Inter-Relationships, Pharmaceutical Retail Studies, Revision Studies, N. F., Revision Studies, U. S. P. and Miscellaneous. The latter include general, direct and general biological research, household products, medicinal chemicals, medicinal organo-metallic compounds, organic research and synthesis, pharmaceutical research and physical-chemical research.

The Table of Contents lists 18 titles, the Preface concisely relates the functions of the National Conference of Pharmaceutical Research and refers to its accomplishments and aims. The contributors are to be congratulated for their work which the Editor has ably presented in this volume. The book contains 170 pages.

The Therapy of the Cook County Hospital. Edited by BERNARD FANTUS, M. D., Chicago.

In their elaboration these articles are submitted to the members of the attending staff of the Cook County Hospital by the director of therapeutics, Dr. Bernard Fantus. The views expressed by various members are incorporated in the final draft for publication. The series of articles will be continued from time to time in the *Journal of the American Medical Association*.

Lea & Febiger, Memorial Volume—This sketch was originally prepared by Henry Charles Lee in 1885, commemorating the one hundredth anniversary of the founding of Lea & Febiger. It has now been revised and amplified and the title changed to conform to the present anniversary—the completion of the 150 years of continuous business activities. The volume contains a number of interesting illustrations, among them the copy of a check returned to General LaFayette on the occasion of a second visit to the United States in 1824 for the sum of \$400.00, upon which the business had been started. There is also a copy of a letter from Washington to Matthew Carey and a copy of Carey's first publication of the *Pennsylvania Evening Herald*.

Proceedings of the 60th Regular Meeting of the National Wholesale Druggists' Association, held at White Sulphur Springs, W. Va., October 1-4, 1934. Former proceedings have been noted in these columns; this report in a general way follows the plan. Much information of value to all readers is contained in these pages relating to laws and business practices. The volume includes the fair trade practices for wholesale druggists discussed in Chicago on December 6, 1934, briefly referred to in the December JOURNAL, page 1252. Publications obtainable through the N. W. D. A. are listed, also bulletins of the statistical division, of the Druggists' Research Bureau, 1928-1929, case studies by the latter, numbering 256 reports. In addition to the records, the addresses and reports contain valuable information relating to all divisions of the drug industries.

We are in receipt of the following dissertations for the Doctor's degree:

Beiträge zur mikroskopischen Diagnostik der Gemüse, Leguminosenhülsen, Wurzel und Knollengemüse, Blatt und Stengelgemüse, Dissertation zur Erlangung der Doktorwürde der Mathematisch - Naturwissenschaftlichen Fakultät der Hamburgischen Universität. Vorgelegt von Hans Volger aus Braunlage (Ostharz), Hamburg, 1934. (Dr. G. Brede-mann).

Beiträge zur Chemie des Gummigutti (Gamboge). Inaugural-Dissertation zur Erlangung der philosophischen Doktorwürde. Vorgelegt der Mathematisch - Naturwissenschaftlichen Abteilung der Philosophischen Fakultät der Universität Basel, von Martha Furrer Apothe-

lerin aus Basel (Dr H Zornig and Dr P Casparis)

Beiträge zur Pharmakognosie der Liliifloren, Anatomie des Laubblattes Inaugural-Dissertation zur Erlangung der philosophischen

Doktorwürde vorgelegt der Mathematisch Naturwissenschaftlichen Abteilung der Philosophischen Fakultät der Universität Basel von Paul Schonman, Apotheker aus Basel (Dr H Zörnig and Dr G Senn)

NOTICE TO CONTRIBUTORS TO THE JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION.

The following notice has been prepared from comments received from members of the Board of Review of Papers and of the Publication Committee

Manuscripts should be sent to Editor E G Eberle, 2215 Constitution Ave, N W, Washington, D C

All manuscripts should be typewritten in double spacing on one side of paper 8½ x 11 inches, and should be mailed in a flat package—not rolled The original (*not* carbon) copy should be sent The original drawings, not photographs of drawings, should accompany the manuscript Authors should indicate on the manuscript the approximate position of text figures All drawings should be marked with the author's name and address

A condensed title running page headline, not to exceed thirty-five letters, should be given on a separate sheet and placed at the beginning of each article

The method of stating the laboratory in which the work is done should be uniform and placed as a footnote at end of first page, giving Department, School or College The date when received for publication should be given

Numerals are used for figures for all definite weights, measurements, percentages and degrees of temperature (for example 2 Kg, 1 inch, 20.5 cc, 300° C) Spell out all indefinite and approximate periods of time and other numerals which are used in a general manner (for example one hundred years ago, about two and one-half hours, seven times)

Standard abbreviations should be used whenever weights and measures are given in the metric system, e g 10 Kg, 2.25 cc, etc The forms to be used are cc, Kg, mg, mm, L and M

Figures should be numbered from 1 up, beginning with the text figures (line engravings are always treated as text-figures and should be designed as such) and continuing through the plates The reduction desired should be clearly indicated on the margin of the drawing All drawings should be made with India ink, preferably on white tracing paper or cloth If coordinate paper is used, a blue-lined paper must be chosen Usually it is desirable to ink in the large squares so that the curves can be more easily read Lettering should be plain and large enough to reproduce well when the drawing is reduced to the width of a printed page (usually about 4 inches) Photographs intended for half tone reproduction should be securely mounted with colorless paste

"Figure" should be spelled out at the beginning of a sentence, elsewhere it is abbreviated to "Fig," per cent—2 words

The expense for a limited number of figures and plates will be borne by the JOURNAL, expense for cuts in excess of this number must be defrayed by the author

References to the literature cited should be grouped at the end of the manuscript under the *References* The citations should be numbered consecutively in the order of their appearance (their location in the text should be indicated by full-sized figures included in parentheses) The sequence followed in the citations should be Author's name (with initials), name of publication volume number, page number and the date in parentheses Abbreviations for journals should conform to the style of *Chemical Abstracts*, published by the American Chemical Society

(1) Author, A Y, *Am J Physiol*, 79, 289 (1927)

Papers presented at the Sections of the AMERICAN PHARMACEUTICAL ASSOCIATION's annual meeting become the property of the Association and may at the discretion of the Editor be published in the JOURNAL Papers presented at these Sections may be published in other periodicals only after the release of the papers by the Board of Review of Papers of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The Editor will appreciate comments from Board of Review and Committee on Publication members, authors and others interested

1935 MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The week of August 5th-10th has been named for the coming eighty-third annual convention of the AMERICAN PHARMACEUTICAL ASSOCIATION to be held in Portland, Ore. Headquarters will be the Multnomah hotel. A. O. Mickelsen is the Local Secretary and inquiries about the convention should be addressed to him, care of the North Pacific College of Pharmacy, Portland, Ore.

This is the first time the A. P. H. A. will convene in the Pacific Northwest, but it has met before on the Pacific coast—once in Los Angeles and twice in San Francisco. Since this organization is the mother of all pharmaceutical associations of the country and draws its membership from all branches of pharmacy, it is expected that the coming conventions will draw large delegations from all sections.

The Mt. Hood Loop Highway, which marks a conquest of man, starts from Portland's doors, circles Mt. Hood towering 11,225 feet into the heavens. The

Mt. Hood in Oregon as seen from the Loop Highway which completely encircles the mountain, the round trip of 175 miles from Portland may easily be made in one day. The mountain itself is practically in Portland's front yard, being only 60 miles due east. Permission to use in JOURNAL A. P. H. A. by Sawyer Scenic Photos, Inc.

world-famed Columbia River Highway starts eastward from the very edge of Portland. It was at Champoege, a little spot on the Willamette 30 miles above Portland, that a provisional government of the Oregon country under the Stars and Stripes was declared on May 2, 1843. At the mouth of the Columbia River a hundred miles from Portland lies Astoria, the first settlement (1811), in Oregon. A few miles beyond lies Seaside, where Lewis and Clark reached the end of the trail. Just across the Columbia from Portland stand Vancouver Barracks, where General Grant and others of his day served as lieutenants and captains. Monuments, statues and shrines mark these places.

A feature of the convention week is the fact that the Oregon, Washington and Idaho State pharmaceutical associations will hold a big tri-state meeting in Portland on August 5th-6th, and it is expected that many of the delegates to this tri-state meeting will remain to participate in the deliberations of the A. P. H. A. group. Further details of these conventions will appear in later issues of THIS JOURNAL.

ANTON HOGSTAD, JR

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIV

MARCH, 1935

No 3

THE CHAIRMAN, NATIONAL PHARMACY WEEK EXECUTIVE COMMITTEE

Anton Hogstad, Jr, Chairman, National Pharmacy Week Executive Committee was born February 21, 1893, in Neenah, Wisconsin. He graduated from the Philadelphia College of Pharmacy in 1914, being awarded the Clement B. Lowe Materia Medica Prize and the Henry Kraemer Microscopical Prize. Following graduation he remained at his Alma Mater for a period of two years in the Department of Botany and Pharmacognosy, after which he became associated with the former H. K. Mulford Company, in charge of the Hay Fever Department at the Glenolden Laboratories.

In 1917 he was called to the South Dakota State College Division of Pharmacy where he remained for a period of eight years, during which time he inaugurated the Medicinal and Poisonous Plant Garden, as well as engaging in an extensive piece of research involving the origin, physiological rôle and production of Oil of American Wormseed. During 1925-1926 he was the D. F. Jones Fellow in the Biochemical Division, University of Minnesota, continuing his studies in Biochemistry, Colloidal Chemistry and likewise Pharmacology.

In 1926 he was chosen to succeed the late Dr. Henry M. Whelpley as professor of Physiology and Materia Medica at the St. Louis College of Pharmacy, and was at that time appointed Pharmacognosist to the Missouri Botanical Garden, at which institution he inaugurated and developed their present medicinal plant garden.

Five years later he entered the retail field, establishing a well-known prescription shop in St. Louis which experienced an unprecedented success, the success of same being due in a large measure to the unusual methods adopted in rendering members of allied professions a distinct type of professional service.

On January 1, 1931, he became associated with Merck & Co., Inc., in the capacity of Special Assistant to the President, with instructions to render American Pharmacy every assistance possible. Upon the death of the late Dr. Robert J. Ruth, Mr. Hogstad was appointed chairman of the National Pharmacy Week

Executive Committee During the course of the past four years he has traveled extensively, lecturing at Colleges of Pharmacy, local, state and national gatherings throughout the United States and Canada, as well as assisting retail pharmacists by rendering a distinct type of personal service

On June 30, 1920, Mr Hogstad was married to Ebba Henrietta Nesseth at Menomonee, Wisconsin, they have four children Mr Hogstad is keenly interested in the native medicinal plants He is the founder of the St. Louis Wild Flower Club He is also vitally interested in Colloidal Chemistry For four years he addressed the St. Louis Colloidal Medical Club monthly on Colloidal Chemistry in relation to Medicine

PRELIMINARY NOTICE FROM THE COMMITTEE ON TRANSPORTATION

Members attending the meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION in Portland, Oregon, August 5th-10th, will have an opportunity to visit the great west at moderate expense and under unusually favorable conditions The Committee on Transportation is working with the railroads and steamboat companies to the end that members will be able to take advantage of very low summer excursion rates to the coast which will allow a wide choice of routes, going out by any one of many routes and returning by any other, including the whole length of California, Oregon and Washington, either from the north or the south

In making arrangements for transportation, the Committee is endeavoring to leave the widest possible latitude of choice to the members, who may stop over at the Grand Canyon, or Yellowstone Park, or any of several other places, and several tours to Alaska will be available at the end of the meeting Professor Gathercoal, the Chicago member of the Committee, is organizing a special tour from Chicago to the convention, with a stop over at Glacier National Park, and returning through the Canadian Rockies, which members from other sections will be welcome to join More detailed information on transportation arrangements will be given in later notices from the Committee —T J BRADLEY, *Chairman*

ABSTRACT SECTION OF THE JOURNAL

Beginning with this issue of the JOURNAL Pharmaceutical Abstracts will be published in a section near the end of the text pages in 32 page forms The latter are paged consecutively so that they can be taken out of the JOURNAL and bound at the end of the year Those who desire may also purchase duplicate forms or obtain bound copies of them

If a sufficient number of laboratories or individuals desire reprints of the Abstracts, arrangements may be made for furnishing them Replies should be mailed promptly to the Editor, 2215 Constitution Ave., Washington, D C

The Abstracts replace those of the YEAR BOOK and as they are published soon after the articles appear in the pharmaceutical publications, it is hoped that they will add to the service given by the ASSOCIATION "The Bibliography of Pharmaceutical Research" heretofore published at the conclusion of the Scientific Section will be discontinued

PAPERS FOR THE SECTIONS OF PORTLAND AND A PH A MEETING

Members of the AMERICAN PHARMACEUTICAL ASSOCIATION who contemplate presenting papers at the Portland meeting are referred to page 172 of the February JOURNAL for the names and addresses of officers of the Sections In sending papers carbon copies may be addressed to the JOURNAL, 2215 Constitution Ave., Washington, D C

EDITORIAL

E G EBERLE, EDITOR

2215 Constitution Ave , WASHINGTON, D C

INTERNATIONAL CONGRESS OF PHARMACY

AS stated in February JOURNAL the International Pharmaceutical Federation has selected Brussels for the twelfth International Congress of Pharmacy, July 30th to August 5th, coinciding with the Exposition Universelle of 1935. The Congress is under the patronage of King Leopold III. The program of the Congress details the entire domain of pharmaceutical subjects: Galenic pharmacy, pharmaceutical chemistry, analytical chemistry, toxicological chemistry, bromatology, pharmacognosy, microbiology, bacteriology, hygiene, history of pharmacy. The Secretary-General is Pharmacist J. Breugelmans, 3 rue du Gouvernement Provisoire, Brussels. Those who will attend should advise the latter promptly, giving title and profession, title of paper and advise whether it will be illustrated and whether experiments will be made during presentation. Only those articles will be accepted which are received prior to May 30th, as they are to be printed in advance of the meeting of the Congress. The official language of the Congress is French, but reports and communications may be written in any other language.

The Scientific Committee is composed of Prof. A. Castille, University of Louvain, Prof. A. J. J. Van de Velde, University of Ghent, Prof. F. Schoofs, University of Liège, Pharmacist O. Van Schoor, Prof. N. Wattiez, University of Brussels. The secretaries are E. Delvaux, University of Louvain, H. Lecocq, A. Gilkinst, Institute of Pharmacy, University of Liège. The Professional Interests Section is presided over by G. van de Vorst, of the Société de Pharmacie d'Anvers. M. Breugelmans is the editor of *Journal de Pharmacie de Belgique*, the February 17th number contains a complete program of the Congress, part of which includes the entertainment features and information relative to trips that may be taken by visitors. It is hoped that visitors from the United States will arrange their travels for attendance at the meeting.

PAN-AMERICAN MEDICAL ASSOCIATION

THE sixth congress of the Pan-American Medical Association will hold its sessions on board the steamship Columbia, sailing from New York on August 28th. The itinerary includes Havana, Curaçao, Trinidad, Santo Domingo, Jamaica, Rio de Janeiro, Santos and Sao Paulo in Brazil. The activities of the Association represent all branches of medicine, including studies on the United States and pharmacopœias of other American Republics. The Association has provided an award for post-graduate study, this year's selection will be made by the medical profession of Brazil.

The session of 1933 was held in Dallas, Tex., at which time Theodore J. Bradley presided over the Pharmacopœial Section. Chairman E. Fullerton Cook,¹ U. S. P. Revision Committee, presented a plan for coöperation, embodying general principles for an effort to reach an agreement on standards, pharmacopœial uniformity, contacts with the Health Departments of the Republics represented,

¹ JOUR. A. PH. A., 22, 456 (1933)

pharmacopœial information, and to agree upon the adoption of suitable titles and synonyms, and uniform strengths and percentages of purity

The general plans of this year's congress were made March 1st, in New York City at a dinner in honor of Dr Oswaldo Aranha, Brazilian Ambassador to the United States. The possibility of valuable results through cooperation of the divisions of medicine in the American Republics is evident, but systematic and persistent encouragement is essential

DIVISION OF HEALTH SCIENCES

THE regents of the University of Michigan at their meeting in January established a Division of the Health Sciences, which is to consist of the Medical School, the School of Dentistry, the Division of Hygiene and Public Health, the University Hospital School of Nursing, the College of Pharmacy and Post-Graduate Education. The purpose of this new division is to coordinate the work of all the divisions of the University which are concerned with the public health sciences, and the committee of this division is to act in an advisory manner.

The faculty of the College of Pharmacy considers that this step is a clear recognition on the part of the regents of the University of the importance of pharmacy as one of the public health sciences.

DRUG JARS IN NEW YORK MUSEUM

THE interest of collectors in drug jars is shown in the exhibition at the American Art Association—Anderson Galleries of the collection of the late John Wanamaker. The latter display was in the home of Mr Wanamaker on shelves which have been brought to the Museum, the containers are traced back to the Middle Ages and were made at the great pottery works of that period, such as Urbino, Castle Durante and Faenze, in Italy, and important centers in France, Holland and Spain.

Associated with the collection referred to are other specimens, mortars and pestles, some of the bronze mortars show "the interest of the time in ornamenting every day objects." Walter Rendell Storey writes interestingly on the subject in the *New York Times Magazine* of March 3rd, in an article wherein descriptions are given of the jars and mortars, now sought by collectors because of their ornamentation and ceramic importance.

DANISH REVIEW OF "PROFESSIONAL PHARMACY"

Svend Nielsen has published an extensive review of "Professional Pharmacy" prepared by Frank A. Delgado and Arthur A. Kimball, under authority of the U. S. Department of Commerce. Daniel C. Roper, *Secretary*, Bureau of Foreign and Domestic Commerce, Willard L. Thorp, *Director*.

This review appeared in the *Farmaceutisk Tidende* and is reprinted as a booklet. It affords the Danish pharmacists an opportunity to acquaint themselves with American pharmaceutical activities and exhibits the interest of Dr. Svend Nielsen in the subject. The authors are honored by the recognition and the AMERICAN PHARMACEUTICAL ASSOCIATION appreciates the value placed on the publication by the pharmacists of Denmark.

It may be stated here that the first edition of "Professional Pharmacy" is exhausted and a revision with considerable important additional matter is in preparation.

THE ACTIVE CONSTITUENTS OF ERGOT A PHARMACOLOGICAL AND CHEMICAL STUDY

BY MARVIN R THOMPSON

(*Concluded from January JOURNAL A PH A*, page 38)

THE CHEMICAL ISOLATION OF A HITHERTO UNIDENTIFIED MEMBER OF THE "TOTAL SPECIFIC ALKALOIDS" OF ERGOT

It was believed, after many unsuccessful attempts in various directions, that the most fruitful procedure to follow in attempting to isolate the new promptly acting alkaloid would be to obtain the total alkaloids in as pure a condition as possible, and then to remove all of the alkaloids having the slow ergotoxine or ergotamine type of activity, leaving the promptly acting new alkaloidal principle or principles uncontaminated as far as the known alkaloids are concerned. This proved to be a successful procedure.

Since the "Total Alkaloidal Fraction" was completely clear and colorless, and since pharmacologic tests had shown this material to contain essentially every trace of the significant activity of the drug, this activity residing wholly in the "total alkaloids" as tartrates, this solution provided an excellent starting point. Accordingly 1 Kg of defatted Ergot was worked up to this point in the previously described manner. This colorless acid aqueous solution was then again alkalinized and exhaustively shaken out with many small portions of ether. The Smith colorimetric test and pregnant cats were extensively used to follow the extractions to prevent loss of alkaloids. As usual, all operations were carried out in the dark to prevent oxidation of these labile substances. The ethereal solution was then taken to complete dryness *in vacuo* first over CaCl_2 , then over P_2O_5 without heat.

This dry amorphous total alkaloidal residue could be purified and freed from most of the known inert (ergotinine, ergotaminine) or "orally slow acting" alkaloid (ergotoxine and/or ergotamine (?), etc.) in a number of ways because of the observation that the new alkaloidal substance, either in the form of the free base or its corresponding salts such as sulphate, phosphate, hydrochloride, tartrate, etc., was found to be far more soluble in all of the common organic solvents (methyl and ethyl alcohol, ether, chloroform, acetone, benzene, carbon bisulphide, carbon tetrachloride) than any of the four well known alkaloids. Especially remarkable was the observation that the new alkaloid was somewhat soluble in water even as the free base, in marked contrast to ergotoxine or ergotamine. Separation of the "orally slow acting" ergotoxine or ergotamine type of alkaloid from the "orally quick acting" new alkaloid could therefore be accomplished either by (a) Dissolving the above total alkaloidal residue in anhydrous ether, converting the alkaloids to their corresponding sulphates causing a precipitation of most of the "orally slow acting" alkaloids which settle out in an over night period, leaving the "orally quick acting" new alkaloid in solution, or (b) Dissolving the total alkaloidal residue in acetone, and cautiously adding water until precipitation of the ergotoxine or ergotamine type of alkaloid was complete, with subsequent removal by filtration, leaving the new alkaloid in solution.

By either procedure the filtrate contained the new "orally quick-acting" alkaloidal substance, which was obtained in an amorphous condition upon removal of the solvent *in vacuo*. In two trial lots, this amorphous alkaloid was purified further by redissolving the material in 0.5% aqueous tartaric acid and taking advantage of the observation that partial saturation with sodium bicarbonate causes precipitation of the new alkaloid from concentrated solutions. The substance

was then collected upon a filter in the dark and promptly dried in a desiccator *in vacuo*. Working with 1 and 2 Kg quantities of ergot, the yield was 176 mg and 221 mg of alkaloid per Kg of original ergot, respectively, indicating that the percentage yield is increased when larger lots of the drug are used.

CHEMICAL NATURE OF THE NEW ALKALOIDAL SUBSTANCE

The new substance has not been obtained in a chemically pure completely crystalline condition. Quantitative data, therefore, will not be given at this time.¹ The approximately quantitative information which follows is presented solely because of the important bearing the results of this report have, *first*, upon the clinical observations of Moir pointing to a new important non-alkaloidal constituent in Ergot, and *second*, upon the suitability of currently used methods of assay and standardization for U S P, B P and other Pharmacopœial preparations of this drug.

The new alkaloidal substance contains all of the elements contained in ergotamine (10), ergotamine (11), ergotinine (12) and ergotamine (11), namely, C, H, O and N. The proportions of these elements likewise have been found to roughly approximate those of the known alkaloids in a single analysis of the (impure?) material. The figures are withheld pending further analyses upon material of known purity but it may be stated that this analysis indicates that the molecule of the new alkaloid is definitely smaller than that of either ergotamine, ergotinine, ergotamine or ergotamine.

It is insoluble in petroleum ether, but definitely more soluble in water, ethanol, ether, benzene, methanol, the chlor ethylenes and the chlor methanes, than the known alkaloids. It appears in representative but variable amounts in all freshly prepared liquid extracts such as Fluidextract of Ergot U S P and Liquid Extract of Ergot, B P. It likewise appears in powdered and pilular extracts such as Ergotin[®] or Aqueous Extract of Ergot N F V in extremely variable amounts, depending largely upon the amount of heat employed in the manufacturing

TABLE II —ALKALOIDS OF ERGOT

No	Alkaloid	Discoverer and Year Reported	Composition (Supposed)	Oxytoxic Activity Following Oral Administration	Van Urk (19) or Smith (3) Color Reaction	Coelcomb and Isolated Rabbit Uterine (2) Reaction.
1	Ergotinine (12)	Tanret (1875)	$C_{25}H_{31}O_5N_3$ (Barger)	Negligible	Positive	Negligible
2	Ergotamine (10)	Barger and Carr (1907)	$C_{25}H_{31}O_5N_3$	Delayed but somewhat active on cat and human	Positive	Powerful
3	Ergotamine (11)	Stoll (1920)	$C_{25}H_{31}O_5N_3$	Delayed but somewhat active on cat and human	Positive	Powerful
4	Ergotamine (11)	Stoll (1920)	$C_{25}H_{31}O_5N_3$	Negligible	Positive	Negligible
5	Pseudo ergotamine (13)	Smith and Timmis (1931)	$C_{25}H_{31}O_5N_3$ (assigned with reservation)	Unknown (probably inert)	Positive	Negligible (?)
6	Sensibamine (14)	Wolf (1931)	$C_{25}H_{31}O_5N_3$	Unknown	Positive	Powerful
7	Ergoclovain (15)	Küssner (1934)	$C_{25}H_{31}O_5N_3 \cdot H_2O$	Unknown	Positive	Powerful
8	X alkaloid	Thompson (1934)	$C H O N$ (mixture (?) formula not yet assigned)	Promptly and highly active on cats and humans*	Positive	Powerful

* See appended note at end of article

¹ This amorphous "X alkaloid" has very recently yielded a crystalline product. Pharmacological and chemical studies upon these crystals are being pursued. Precise qualitative and quantitative data may, therefore, be presented in a later report.

process Boiling temperatures gradually destroy the alkaloid in aqueous medium, but the destruction is usually far from complete after many hours, especially if partial vacuum is coincidentally employed to affect concentration of the extract Concentration of extracts in metallic vessels, with heat *in vacuo* or otherwise, markedly accelerated the destruction of this active substance as well as the other alkaloids

The new alkaloid is much more stable than the ergotamine type of alkaloid in crude extracts (either liquid or solid) Oxidation, spontaneous or chemically induced, causes the substance to become yellow, and finally a dark brown This oxidation is attended by a corresponding decline in oxytocic activity

Tested colorimetrically by the Smith method, or as modified by the 1932 B P, the blue color was readily obtained Of five different lots prepared to date, the intensity of the color reaction ranged from approximately 30% (for the less purified material) up to 60% (for the more purified material) of that produced by equivalent concentrations of ergotamine ethanesulphate

It is of interest at this point to consider the possible identity of the new alkaloid, and its possible relationship to the four well-known alkaloids, as well as some alkaloidal substances which have been obtained and described by others since 1931 These alkaloids, exclusive of substances known to be degradation products of the alkaloids, with their discoverers, etc, may be tabulated as in Table II

It will be observed from Table II that all of the known alkaloids are closely related chemically They can be distinguished from one another, however, by differences in solubility, optical rotation, melting points (especially their crystalline salts which generally melt more sharply than either the crystalline or amorphous bases themselves), ease of crystallization, crystallizing medium, and character of crystals, but the very practically important and readily utilizable method of distinguishing between them is to be found in the promptness of their pharmacological and clinical activity following oral administration

Alkaloids Nos 1 and 4 may be at once dismissed as unimportant because they are practically inert even upon the isolated uterus No 5 probably falls in the same class, because of its extremely close relationship to the inactive ergotamine (13) They are pharmacologically inert thereby differing in the main essential from Nos 2, 3, 6, 7 and 8 Nos 2, 3, 6, 7 and 8 all appear to be pharmacologically active when tested upon the isolated rabbit uterus or other hitherto widely employed pharmacologic methods Nos 2 and 3, however, differ greatly from No 8 in that the oxytocic response following oral administration to pregnant cats is much more prompt and effective for No 8 than for Nos 2 and 3 As to Nos 6 and 7, nothing can be said from the standpoint of promptness or effectiveness when given orally since they were not available for this study nor has any such information been made available by others Regarding No 6, Barger (16) stated that Stoll had challenged the claim that this was a new alkaloid because upon mere recrystallization ergotamine was obtained (Note chemical similarity between 6 and 7) As to the relationship existing between Nos 7 and 8, it can only be stated that they are both highly active upon the isolated rabbit uterus, they appear to be similar as to solubility, both being water-soluble, but whether No 7 exhibits the prompt oral activity of No 8 is unknown None of No 7 was available for this study because of the fact that the report by Küssner (15) was obtained just prior to the sending of this report to press

PHARMACOLOGIC ACTION OF THE NEW ALKALOID

(a) *Upon the Cockscomb*—The U S P Cockscomb method measures this alkaloid along with the ergotamine or ergotamine present in ergot preparations 0.2 to 0.4 mg per Kg consistently produced definite cyanosis of the combs

(b) *By the Epinephrine-Inhibition Isolated Rabbit Uterus Method* (2)—The purest of the five lots prepared to date acted in a manner qualitatively indistinguishable from ergotamine or ergotamine Quantitatively the new substance appeared to be slightly more than half as potent as ergotamine, in its possibly contaminated amorphous state

(c) *Upon Carotid Blood Pressure of Anesthetized Cats and Dogs*—Injected intravenously, a pressor action was demonstrated upon both cats and dogs, the effects upon the two species being similar An example of this activity is shown in Fig 10 The pressor effect was also similar to that of either ergotamine or ergotamine by the intravenous route

The "vasomotor reversal" was readily produced in two cats as illustrated in Fig 10 a. Repeated dosage produced gradually diminishing pressor response until doses similar to the first effective dose would no longer produce an effect.

Oral doses up to 1 mg produced no significant change in carotid blood pressure of cats during one hour.

(d) *Upon the Isolated Uterus of the Guinea Pig*—These effects, using immature virgin uteri were likewise indistinguishable from those of the "Total Alkaloidal Fraction," already described.

Fig 10 —Male cat 29 Kg Dial urethane anesthesia carotid blood pressure. The pressor response following the intravenous administration of 0.1 mg of "X alkaloid."

Fig 10 a —Male cat 3.1 Kg Dial urethane anesthesia, carotid blood pressure, illustrating the "vasomotor-reversal" induced by the "X alkaloid." Minutes

Fig 11 —Cat late pregnancy uterus *in situ*. The prompt response following the oral administration of 1.0 mg "X alkaloid," with 10 cc of water.

Following the method previously described by the author (7), using mature uteri histamine response was effectively inhibited in a manner similar to that produced by ergotamine or the "Total Alkaloidal Fraction."

(e) *Upon Normal Unanesthetized Pregnant Cats*—Either oral (1.0 mg) or subcutaneous (0.5 mg) doses were consistently effective in terminating pregnancy in a total of 21 cats in various stages of pregnancy. The young were invariably dead at birth. Death of two cats resulted after abortion following a subcutaneous dose of 1.0 mg to each but this dose was not always fatal.

(f) *Upon the Uterus of the Lightly Anesthetized Pregnant Cat*—This was the only pharmacologic method which clearly revealed a difference between the new alkaloid and ergotamine.

Recording the movements of the uterus of the pregnant cat *in situ*, in the usual manner, oral doses of 1.0 to 2.0 mg of the new alkaloid in 10 to 20 cc of water have been observed to produce a uterine response usually well within five minutes rarely beyond ten minutes, in 17 experiments.

Corresponding doses of ergotamine or ergotamine, as shown earlier in this report, are active in causing a response, but never in less than twenty minutes (usually thirty minutes or more). An example of the prompt response is illustrated in Fig 11. The activity is of long duration. Experiments have been observed up to four hours at which time evidence of activity had not ceased to be apparent.

SUMMARY AND CORRELATION OF RESULTS

The uterine activity of various "type" extracts of ergot and commercially available salts of ergotamine and ergotamine has been studied by observing the effects following oral, subcutaneous and intramuscular administration to anesthetized and unanesthetized cats in the later stages of pregnancy.

The method involving the recording of the uterine movements of the pregnant cat *in situ* provided a means of pharmacologically demonstrating an important difference between ergotamine or ergotamine, and crude aqueous or hydroalcoholic extracts of ergot, confirming Moir's clinical observations on this point. These studies have also confirmed Moir's conclusion that there exists in ergot a highly important new "as yet unidentified substance" in ergot.

Contrary to Moir's apparent belief, however, the present studies have shown that all of the activity obtained from his various ergot preparations, could have been obtained from no constituents of ergot other than one or more of the "total alkaloids." Even in the case of his "Aqueous Extracts," which are admittedly deficient in ergot alkaloids, the present studies have demonstrated that all of the significant activity shown by these preparations could have been due to no substances other than "residual alkaloid."¹

¹ In a recent lecture (November 14, 1933) on ergot in London by Professor G. Barger (16) the lecturer discussed, among other things, the clinical observations of Moir pointing to a new important non alkaloidal principle in ergot. "The lecturer stated that this was also his own opinion up to about three months ago, when he thought that that was the situation. One U. S. worker, Marvin Thompson, who has published some accurate estimations of Ergot varieties had raised doubts in his mind as to whether the action was not, after all, due to some residual alkaloid. He would like to say very little on the subject, and he put forward the suggestion with some hesitation." The discussion provoked by Prof. Barger's lecture was also published by the same *Journal* (16). This discussion was very interesting to the present writer, inasmuch as the comments were made by a number of workers who have been most active in this field, including Dr. Moir, Sir Henry Dale and Professor Burn. It is quite obvious, from the comments made by these workers that they had little faith in the contention of "the American worker" that the activity observed by Moir from Aqueous Extracts was due to 'residual alkaloid.' Professor Burn stated that 'it was difficult to see how 'residual alkaloid' could produce an effect in a patient either quicker or as quickly as any other physiological effect.' Dr. Moir stated, in part, that 'The point was that an 'inactive' preparation proved to be active,' obviously implying that an alkaloid free preparation was clinically active. Sir Henry Dale stated, among other things that 'With regard to his (Professor Barger's) statements, referring to work in America which suggested that the action was due to residual alkaloid, he did not believe it. He thought that the amount of residual alkaloid was quite trivial.'

Replying to these comments, the present writer refers the reader to the evidence of this report including the appended note. It was this evidence which was discussed with Professor Barger during his visit in Baltimore, and which caused him to make mention of the matter in his lecture. In the studies reported by Moir, it is believed that the prompt and impressive activity he obtained from all of his extracts was due to ergot alkaloids. Although he assumed his aqueous extracts to be essentially alkaloid free, assays of numerous such extracts by the present writer have usually shown them to contain an alkaloidal content of 0.05 to 0.20 mg.

A chemical procedure for completely separating ergot into its "total alkaloidal" and "non-alkaloidal" fractions has been described. The colorless "Total Alkaloidal Fraction" has been found to contain all of the significant oxytocic activity of the drug, while all of the remaining constituents of ergot contained in the "Alkaloid-free" fraction were found to be completely devoid of any valuable oxytocic activity.

The "Total Alkaloidal Fraction" was observed to exhibit oxytocic activity in a manner superior to that of ergotoxine or ergotamine, proving that the "Total Alkaloidal Fraction" contained at least one hitherto unknown alkaloid.

A chemical procedure has been described for fractionating the "total alkaloids" by removing the ergotoxine, ergotamine, ergotinine and ergotaminine, leaving the new alkaloidal substance in solution. A method for the purification and isolation of the new substance in amorphous condition likewise has been presented. This substance, as it was obtained for these studies, was not proved to be a pure chemical entity, but was highly active.

The new alkaloid was found to differ pharmacologically from the hitherto known active alkaloids mainly in the promptness of its oxytocic action, especially following oral administration. The action of the new alkaloid usually developed in one to ten minutes, while the action of ergotoxine and ergotamine developed in twenty-five to sixty minutes, following oral administration of large doses to pregnant cats. Hitherto available methods (blood pressure, cockscomb, isolated tissues, etc.) failed to significantly distinguish qualitatively between ergotoxine or ergotamine and the new alkaloid. This is undoubtedly the reason for the hitherto well-established, although erroneous, opinion among pharmacologists that either ergotoxine or ergotamine were completely representative of the total activity of the drug or its extracts.

The results make it appear that the chief important differences between the new "X alkaloid" and the well-known ergotoxine or ergotamine are that the former is more soluble and more rapidly absorbable than either of the latter alkaloids. Little, if any difference is evident upon blood pressure following *intravenous* administration, or when compared upon *isolated* smooth muscle. It should be emphasized, however, that while the two types of alkaloid act similarly upon *blood pressure* following intravenous administration, the activity upon the *uterus in situ*, by the same route, is by no means similar. The activity of the new alkaloid is definitely more prompt and pronounced than that of ergotoxine or ergotamine, although the difference is not as great as when both types of alkaloid are given orally. It would appear, therefore, that the effect of either upon blood pressure is almost immediately dependent upon the concentration in the blood stream, but that the uterine effect is produced only after some further absorption or diffusion from the blood stream, perhaps into the lymphatic circulation, before exerting an effect upon the uterine innervation.

per cc in terms of either ergotoxine or ergotamine. Since Moir administered doses of such extracts ranging from 4.0 to 16.0 cc, it should be observed that the alkaloidal equivalent of such doses would range somewhere between 0.2 and 3.2 mg. The present writer has found that the greater part of the total alkaloids of aqueous extracts consists of the new alkaloid instead of ergotoxine or ergotamine, because of the greater ease of extraction and greater stability of the new alkaloid. Interpretation of Moir's results in the light of the results of this study, shows that the oxytocic effects he obtained from even his aqueous extracts were certainly due to "residual alkaloid," and this consisting principally of the new alkaloid here described.

It has been demonstrated that the active principles of ergot (total alkaloids) are not absorbed from the stomach of the cat, and that absorption occurs only after passage through the pylorus into the intestine. It is believed that this is probably likewise true in humans because of the fact that the time for onset of action from a given active preparation is not absolutely constant for different patients (see appended note, also Moir's results). Administration of the oral dose with 10 to 20 cc. of water causes a much more consistently prompt response in cats, than when the same dose is given without water, presumably due to a more prompt opening of the pylorus stimulated by the larger bulk of fluid.

Aqueous and hydro-alcoholic extracts, when injected subcutaneously or intramuscularly, were observed to be intensely irritant. In the large doses, huge, slow-healing abscesses were produced. This is not an uncommon experience with clinicians. The severe irritation and abscesses have been shown to be caused, not by the valuable colorless (in solution) oxytocic constituents of ergot, but by the difficultly absorbable, deeply colored, inert fraction. The presence of these difficultly absorbable inert constituents in injectable ergot preparations should be condemned.

Hydro-alcoholic types of liquid extracts of ergot, when freshly and properly prepared, have been shown to contain all of the "total alkaloids" of the drug. They are, therefore, completely representative of the drug itself, as far as oxytocic activity is concerned. They are suitable for oral administration only, because they contain the irritant and difficultly absorbable inert constituents, and are, therefore, prone to cause pain and abscesses upon hypodermic injection.

Aqueous types of liquid extracts of ergot do not contain all of the "total alkaloids" of the drug. They have been found to contain practically all of the promptly acting new "X alkaloid," but only insignificant amounts of the slow acting ergotoxine or ergotamine type of alkaloid. Although the promptly acting "X alkaloid" is the more important because of its prompt action, the slow-acting ergotoxine or ergotamine type of alkaloid is, nevertheless, significantly active, undoubtedly adding considerably to the duration of effect. Such preparations, therefore, cannot be regarded as being completely representative of the drug. They are suitable for oral administration only, because they contain the irritant and difficultly absorbable inert constituents, and are, therefore, prone to cause pain and abscesses upon hypodermic injection.

The value of solid or pilular extracts (ergotins) for oral administration depends entirely upon the type of procedure used in their manufacture, particularly with respect to the amount of heat used. They can be prepared so as to be highly active, and if physiologically standardized, should be dependable. Most of such extracts available at the present time have had much of their alkaloidal activity destroyed by the excessive heat used in their manufacture (from the examination of 37 commercial samples, the manufacturing process of which was precisely known by the writer for 19 of the samples), and practically none of them is standardized. They owe the greater part of any activity they possess to the new "X alkaloid."

The currently available methods of assay and standardization have been studied with reference to their value in measuring activity in ergot preparations, and their relative merits discussed. The U S P Coaksecomb method, the Broom-Clark Rabbit Uterus method, the Thompson Histamine-Inhibition Guinea-Pig

Uterus method, and the Smith colorimetric method, with the various modifications of each, have been shown to measure the new alkaloid along with the ergotoxine or ergotamine type of activity, but none of these methods can readily serve to distinguish between the prompt-acting new alkaloid and the slow-acting ergotoxine or ergotamine type alkaloid as these alkaloids exist in official extracts. Inasmuch as the new alkaloid is extracted easier, and appears to be much more stable than the ergotoxine or ergotamine type alkaloid (as these alkaloids exist in Pharmacopœial ergot preparations), it is believed that the use of any one of the above methods can be applied in such a manner as to insure satisfactorily standardized amounts of activity in such extracts. The method should, therefore, be chosen from the standpoint of routine reliability and precision. From this standpoint, the author favors a modification of the Broom-Clark Rabbit Uterus method (2), but has become favorably impressed with the merits and possibilities of the Colorimetric method. These methods will receive more specific consideration in a separate communication.

All of the above methods require the use of a "standard of comparison." The writer has examined all of the only four lots of U S P Standard Fluidextract ever prepared and distributed by the U S Department of Agriculture. Nos 635, 636 and 2160 have been shown to be unstable in an earlier report (17). The last lot prepared and distributed, No 2835, has been observed to lose not less than half of its original activity from the time it was first tested, in July 1932, until last tested in January 1934. This standard, therefore, fails in its purpose.

The author (18), in 1930, recommended that either ergotoxine ethanesulphonate¹ or ergotamine tartrate be adopted as the bioassay standard in place of the faulty "U S P Standard Fluidextract." These two salts have now been employed by the writer for over five years in testing ergot preparations. Both have been found to be satisfactory from the standpoint of stability. Since the newly discovered alkaloid shows a type of activity which is measured by all of the assay methods enumerated above, being practically indistinguishable from ergotoxine or ergotamine by such methods, and since a preparation of the new alkaloid of proven stability cannot be available for at least several years, it is believed that the adoption of one of the alkaloidal salts previously recommended is a virtual necessity. Until more appropriate methods of assay are available, a perfectly stable salt of the new alkaloid would have no advantage over available ergotoxine or ergotamine salts as a bioassay standard of comparison. In the light of evidence to date, including Moir's observations upon humans, the observations set forth in this report, and the studies by Koff upon humans (see appended note), the relationship existing between quantitative bioassay results (U S P or other methods measuring "total alkaloidal activity") may be illustrated by taking a properly prepared representative U S P Fluidextract of Ergot as containing all of the therapeutically active principles of the drug. Arbitrarily assigning the value of 100% to both the clinical activity and the bioassay (cockscorn, etc.) activity, the new "X alkaloid" is present in such proportions as to account for 15 to 25% of the bioassay activity, but owing

¹ The ergotoxine ethanesulphonate used in these studies was very kindly supplied by Dr Clifford S. Leonard, Burroughs Wellcome & Co. For the generosity in supplying the ergotamine tartrate and methanesulphonate here employed, the author is indebted to The Sandoz Chemical Works.

to the great clinical effectiveness of this alkaloid, it accounts for approximately 75% of the clinical activity. The slow and feebly acting (clinically) ergotoxine or ergotamine type of alkaloid in such a fluidextract accounts for 75 to 85% of the bioassay activity, but only 15 to 25% (approx.) of the clinical activity. The "X alkaloid" is extracted much more easily and is more stable than the ergotoxine type of alkaloid. Therefore, a fluidextract may assay as low as 15 to 20% of U S P requirements and still retain the greater part of its clinical oxytocic activity.

CONCLUSIONS

1 The pregnant cat has been found to be a suitable test subject upon which to study comparatively the oxytocic activity of various types of preparations and constituents of ergot.

2 A procedure, involving oral administration of the ergot preparations, has been described and used extensively for the above purpose. Such a procedure can be successfully employed in investigating the chemical source of the significant oxytocic activity of ergot.

3 Carefully prepared hydro-alcoholic extracts of ergot, such as Fluidextract of Ergot, U S P (U S P X or Interim Revision), or Liquid Extract of Ergot, 1932 B P, contain all of the important active principles of the drug. Such preparations are rich in alkaloids and are remarkably prompt and effective upon the uterus following oral administration.

4 Aqueous extracts of ergot do not contain all of the important active principles of the drug. They are deficient in ergot alkaloids, but are never alkaloid-free unless they are many years old or the alkaloids have been destroyed by excessive heat in their manufacture. When carefully prepared, these extracts are remarkably prompt and effective upon the uterus following oral administration. This prompt and effective activity is entirely out of proportion to the ergotoxine or ergotamine equivalents of such preparations.

5 Ergotoxine and ergotamine are indistinguishable in producing a much delayed and erratic action following oral administration. The activity of these alkaloids is, therefore, far from being completely representative of the drug itself or its crude extracts, as formerly supposed.

6 A hitherto unknown, highly important, active principle exists in ergot.

7 Every trace of the significant oxytocic activity has been found to reside in the chemically purified "total alkaloids" of the drug, even in the so-called aqueous extracts, as shown by the prompt activity obtained from the "Total Alkaloidal Fraction" in contrast to the complete lack of significant activity in the "Alkaloid-Free Fraction."

8 Ergotoxine and ergotamine are not representative of the "total alkaloidal activity." The new active principle appears, therefore, to be another member of the specific alkaloids of ergot, since it followed the other alkaloids in the chemical procedure used in obtaining the "Total Alkaloidal Fraction."

9 The activity of aqueous extracts observed by Moir must have been due, contrary to his belief, to "residual alkaloid" consisting mainly of the new alkaloid described in this report. The alkaloidal deficiency of such extracts is due to the inefficiency of water in extracting the ergotoxine or ergotamine. Most of the more

stable new alkaloid is readily extracted by water and hence appears in fairly representative amounts in such extracts

10 The new alkaloid has been isolated in a sufficiently pure amorphous condition to permit of certain pharmacological and chemical comparisons with the hitherto known alkaloids

11 The new alkaloid is closely related to ergotovine and ergotamine as is shown by similar chemical behavior and also as is shown by its similar pharmacological action when tested upon the isolated guinea-pig uterus, the isolated rabbit uterus, the cockscomb and the carotid blood pressure of cats or dogs. Its activity persists for hours, as does that of ergotovine and ergotamine

12 The new alkaloid differs from ergotamine and ergotovine mainly by its much more soluble nature, and by its more prompt and powerful oxytocic action following oral administration. The greater solubility, together with the probability that the new alkaloid has a smaller molecule, compared with ergotovine or ergotamine, undoubtedly accounts for the more prompt absorption and greater effectiveness of the new alkaloid

13 All of the remarkable observations of Moir can be explained by the demonstration of the existence of the new alkaloid

14 None of the active oxytocic principles of ergot (the specific alkaloids) are absorbed to any significant extent from the stomach of the cat, following oral administration

15 All of the active oxytocic principles of ergot (the specific alkaloids) are absorbed with varying degrees of rapidity from the intestine of the cat following oral administration. The new alkaloid is promptly absorbed while ergotovine and ergotamine are absorbed with great difficulty. This difference in absorption rate also manifests itself following subcutaneous or intramuscular injection

16 Ordinary aqueous or hydro-alcoholic extracts of ergot are intensely irritant to the tissues following subcutaneous or intramuscular administration. Severe abscesses develop at the site of injection, especially following the larger doses

17 The irritant and abscess-forming properties are not due to the important active principles (the specific alkaloids) of ergot. They are due to the otherwise pharmacologically inert extractives appearing in the liquid extracts

18 The color of an ergot preparation is no indication of its value or activity. The purified, total active principles are colorless in solution

19 Either ergotovine ethanesulphonate or ergotamine tartrate constitutes the best available "standard" for comparison in the evaluation of ergot preparations by the currently accepted quantitative methods

20 The Isolated Guinea-Pig Uterus method, as usually applied (as in testing *Liquor Pituitarii, U. S. P.*), is wholly unreliable as a means of insuring significant activity in ordinary aqueous or hydro-alcoholic extracts. It measures chiefly the worthless non-specific amine activity of such extracts

21 Clinical activity in reasonably standardized amounts can be insured by requiring official liquid ergot extracts to contain a total specific alkaloidal activity, equivalent to approximately 0.05 per cent, in terms of either ergotovine ethanesulphonate or ergotamine tartrate, when tested by the Cockscomb method, the Epinephrine-Inhibition Rabbit Uterus method or the Colorimetric method. This will provide for the presence of essentially all of the more important new alkaloid

present in the parent drug, plus varying but larger proportions of the less important ergotoxine or ergotamine. None of these methods can serve to differentiate between the new alkaloid, ergotoxine or ergotamine in crude extracts.

22 Solid or pilular extracts can be made to contain a satisfactory amount of activity by extracting properly and avoiding the use of excessive heat and exposure to oxygen in the process of concentration.

23 The non-specific amino-bases of ergot (histamine, tyramine, choline, etc.) contribute nothing of a desirable nature to the characteristic oxytocic activity of the drug.

NOTE ADDED MAY 1, 1934

Through the kindness of Dr. Arthur K. Koff, Woman's Clinic, The Johns Hopkins Hospital, some clinical confirmation of the pharmacological and chemical evidence of this report has been obtained. During the past two years, Dr. Koff has conducted over fifty experiments upon human patients, recording the oxytocic action of drugs in a manner essentially similar to that employed by Dr. Moir in England. After observing the clinical response of different ergot preparations, he has, among other things, confirmed Dr. Moir's observations that both the aqueous and alcoholic types of crude extracts, given orally, cause a remarkably prompt and intense uterine response, entirely out of proportion to their ergotoxine or ergotamine equivalent, and that oral doses of salts of ergotoxine and ergotamine produce only a much delayed and feeble response even in very large doses.

Upon being informed of the pharmacological and chemical results obtained by the author, Dr. Koff very kindly agreed to observe the activity of certain preparations upon human patients recording the uterine contractions directly as in Moir's experiments. The author's "Alkaloid Free Fraction," freshly prepared as described in the above report except that 1 cc. represented 2 Gm. instead of 1 Gm. of ergot administered orally to three patients, proved to be completely inert in doses up to 10 cc., representing 20 Gm. of the original ergot. The original fluidextract, from which the "Alkaloid Free Fraction" was prepared, produced the characteristic prompt and pronounced effects of the crude extracts upon these same patients, in 4-cc. doses (representing 4 Gm. ergot), the effect developing within fifteen minutes in every case.

An oral dose of 40 cc. of "Total Alkaloidal Fraction," prepared as described in the above report, and representing 40 Gm. of the original ergot, administered to one patient, produced a pronounced effect well within fifteen minutes. The promptness of action was indistinguishable from that produced by the fluidextract from which both "fractions" were prepared. The effect was still pronounced after nine hours, observations being discontinued at this point.

The orally "slow acting" ergotoxine or ergotamine type of alkaloid, separated in the usual described manner from the "Total Alkaloidal Fraction," proved to be devoid of the prompt type of activity following an oral dose of the alkaloid equivalent to 8 Gm. of the original ergot to one patient. No effect whatever was evident for more than an hour, after which a feeble effect entirely similar to that produced by available salts of ergotoxine and ergotamine, was produced.

These clinical experiments are especially significant because of the fact that the difference between the delayed and erratic ergotoxine or ergotamine effect and the prompt action of crude extracts is so great and so consistent that it is quite unnecessary to carry out numerous experiments in order to show the difference. It will be noted that these experiments upon humans have confirmed the results obtained upon the pregnant cat in every case. The "Alkaloid Free Fraction" was capable of producing no oxytocic effect upon cat or human. The "Total Alkaloidal Fraction" produced a prompt and intense oxytocic effect upon both cat and human. The ergotamine or ergotoxine type of alkaloid removed from the "Total Alkaloidal Fraction" produced a much delayed feeble effect upon the human and the cat (huge doses to cats produce an intense effect, but it is always much slower in developing than in the case of the crude extracts or the "Total Alkaloidal Fraction"), entirely similar to that produced by commercially available salts of ergotoxine and ergotamine.

The details of these clinical experiments will be more completely described elsewhere by Dr. Koff.

The author wishes to acknowledge indebtedness to Professor E V McCollum, School of Hygiene and Public Health, The Johns Hopkins University, for his inspirational guidance, and to express sincere appreciation for his constant encouragement during this investigation

He also wishes to express gratitude to Professors J J Abel, E K Marshall and E M K Ceiling, Department of Pharmacology of the Medical School, The Johns Hopkins University, and Professor G Barger, University of Edinburgh, for helpful criticism and valuable suggestions, and to Dr Arthur K Koff of the Woman's Clinic, The Johns Hopkins Hospital, for extending invaluable clinical cooperation

Full responsibility is assumed by the writer, however, for any errors in presentation, results or conclusions which may appear in this report

SOME PHARMACOLOGICAL AND BACTERICIDAL PROPERTIES OF UMBELLULONE ^{1 2}

BY MILES E DRAKE³ AND ERNST T STUHR

INTRODUCTION

The literature on the oil of the California laurel, *Umbellularia californica* (Hook and Arn) Nutt, includes very little information on the pharmacology of the oil, or of the ketone (umbellulone) obtained from it Likewise, no reference was

* Scientific Section, A PH A, Washington meeting, 1934

found in the literature on volatile or essential oils in regard to the germicidal or fungicidal activity of this oil and ketone. Extensive research has been pursued on the chemistry of the constituents in this oil by various investigators.

Persons who have come in close proximity with the myrtle oil or its vapors report discomforts, such as severe headaches, irritation of the skin and mucous membrane, and in several instances unconsciousness resulted. The apparent potency of the oil prompted this investigation.

HISTORICAL

Umbellularia californica (Hook. and Arn.) Nutt. was first collected in California by Menzies (1) in the latter part of the eighteenth century. Prior to Menzies, the Spaniards of California knew the tree as *Laurel Silvestre*.

In 1826 Douglass (2) classified this evergreen tree as a laurel, *Laurus regia* (the regal laurel) probably intending to indicate the beauty and splendor of the tree.

In 1833 Hooker and Arnott (3) classified this evergreen as *Tetranthra californica*. Later Nuttall (3) gave it the present name of *Umbellularia californica*. As far as has been reported this is the only representative of the genus *Umbellularia*.

Heaney (4) in 1875 by fractionation under reduced pressure obtained from the oil of the California laurel a colorless liquid (Orcodaphenol) possessing a pungent odor.

Stillman (5) in 1880 by fractionation at 215-216° C. obtained a colorless mobile liquid possessing an aromatic but pungent odor. Excessive inhalations of the vapors of this fraction were observed to produce headaches.

Powers and Lee (6) in 1904 reported the following principles or constituents which the oil yielded on fractionation: pinene, cineol, eugenol, methyl eugenol and a ketone, umbellulone, which was collected at 217-222° C. The purified ketone had a sp. gr. of 0.9584 at 15/15, $[\alpha]_D^{25} - 37^\circ$ in a 100 mm. tube. Powers and Lee (6) concluded that umbellulone had one ethylenic linkage, and gave it the following structural formula:

Fig 1 —Myrtle Tree (*Umbellularia californica*)

Tuttn (7) in 1908 gave umbellulone the following structural formula

Semmler (8) in 1908 gave umbellulone the structural formula which is accepted to day. According to Spiegel (9) sabinol, thujone and umbellulone are very similar in structure.

DISTILLATION AND DESCRIPTION OF THE OIL OF MYRTLE

The leaves after drying are steam distilled. The oil is collected in an excess of water distillate which on standing separates into two layers, the oil layer being on top of the water layer. The layer of oil is decanted and dried over anhydrous sodium sulphate. The yield of the oil, according to Parry (10) varies from 2.5 to 5.5 per cent.

The oil of *Umbellularia californica* is a clear brownish yellow liquid. It possesses a sweet but pungent irritating, empyreumatic, persistent odor. Parry (10) gives this oil a sp gr of 0.935 to 0.950, and an optical rotation of -22° . Sawyer (11) states that the dry oil has a sp gr of 0.936 and a solubility of 1/1000 in water.

THE KETONE FROM THE OIL OF MYRTLE

Wienhaus and Todenhofer (12) in 1929 prepared the ketone, umbellulone, from the oil of myrtle by preparing a water soluble sulphite addition product from the oil. This addition product was steam distilled and purified by fractionation under reduced pressure. Following the method of Wienhaus and Todenhofer no appreciable ketone yield was obtained, therefore, the following modified method was employed.

Method No 1 Modified Wienhaus and Todenhofer—Three hundred and fifty grams of myrtle oil were shaken out twice with a saturated solution composed of 400 Gm of sodium sulphite and 80 Gm of sodium bicarbonate in 400 cc of distilled water. This solution when neutral to five drops of phenolphthalein was shaken vigorously for 30 minutes. The resulting mixture was allowed to separate and the oil layer was decanted. This oil was then treated with a second 400 cc of the saturated sodium sulphite-bicarbonate solution and permitted to stand 24 hours. The oil was again decanted and the aqueous portions of the first and second washings were combined and steam distilled in a neutral condition for two hours in order to free the aqueous solution of any excess oil. The oil-free aqueous residue was treated with 40 Gm of stick sodium hydroxide and the mixture was steam distilled for three hours. The resulting product was fractionated under 4-mm reduced pressure, yielding purified umbellulone at $77.5-77.8^\circ \text{C}$ (uncorrected). Yield 48 Gm.

Physical Constants of the Ketone (Umbellulone)— $[\alpha]_D^{25} -38.50$, $n_D^{25} 1.48285$, $d_4^{25} 0.9465$, agreeing fairly well with the reports of Wienhaus and Todenhofer (12).

The following tabulation gives the constants reported by various investigators.

TABLE I

	Sp Gr	Op Act	R I	B P 4 Mm
Wienhaus and Todenhofer (12)	0.949 (20°)	-38.51	1.48315 (20°)	85°
Stillman (5)		-36.30		
Powers and Lee (6)	0.9614 (15.5°)	-36.33	1.18325 (20°)	
Authors	0.9465 (25°)	-38.50	1.48285 (20°)	$77.5-77.8^\circ$

Method No 2 Fractionation—Three hundred grams of myrtle oil were fractionated at 4 mm reduced pressure. A total of nine fractions was collected. Fraction IV (74–78° C) and Fraction V (78–80° C) were refractionated. Fraction No 2 (77.1–77.6° C) of IV, and fraction No 1 (77.2–77.7° C) of V were combined and refractionated, yielding 61 Gm of the ketone, umbellulone at 77.1–77.7° C. Only two physical constants were taken of this fraction. The B P by the capillary method (13) was found to be 216–217° C (corrected). The refractive index was found to be 1.4830 at 21° C. Yield. The following percentages of ketone yield were obtained:

Modified Wienhaus and Todenhofer method	13.71%
Fractionation method	20.3%

as compared to yields reported by previous investigators

Wienhaus and Todenhofer (12)	24.5%
Powers and Lee (6)	60.0%
Stillman (5)	40.0%
Russell (14)	28.0%

SOLUBILITY OF UMBELLULONE

Freely soluble in 70 per cent alcohol	Freely soluble in liquid petrolatum
Freely soluble in olive oil	Freely soluble in Miller solvent (19)

PRELIMINARY INVESTIGATION

Effects on Blood *in Vitro*—To determine the action of umbellulone on defibrinated blood *in vitro* the method of Dessemontit (15) was used. To one cc of blood was added three cc of 0.9% sodium chloride and 0.06 cc of umbellulone. This mixture was warmed gently, placed in a Sedgwick counter and observed through a spectrometer. Horse blood and guinea-pig blood were used.

Results

Diluted horse blood—no bands were present within range of methemoglobin

Diluted horse blood plus 10% solution of potassium ferricyanide—upon heating gently the blood became a chocolate brown and the following bands were noted:

First Trial		Second Trial	
First band	635–631 μ	First band	636–632 μ
Second band	588–572 μ	Second band	587–572 μ
Third band	554–532 μ	Third band	544–532 μ

Diluted horse blood plus 0.06 cc of umbellulone—upon heating the blood became a chocolate brown and the following bands were noted:

First Trial		Second Trial	
First band	635–631 μ	First band	634–631 μ
Second band	587–571 μ	Second band	589–573 μ
Third band	555–536 μ	Third band	554–532 μ

Diluted guinea pig blood plus 0.06 cc of umbellulone—the following bands were noted:

First Trial	Second Trial	Third Trial
First band	634–630 μ	635–630 μ
Second band	586–572 μ	589–572 μ
Third band	553–533 μ	553–534 μ

The bands obtained on both horse blood and guinea-pig blood are in fair agreement with those reported by Halliburton (16). The center of the absorption band considered as characteristic had a wave-length of 630–634 μ , according to Dessemontit (15).

Effects on Blood in Vivo—A guinea pig received two cc of 1 1000 umbellulone in olive oil intraperitoneally three times a week for six weeks. At the end of six weeks the blood was obtained by the heart stab method and kept at 37.5° C until used. To one cc of this blood was added three cc of 0.9 per cent sodium chloride solution. The results were as follows:

First band	634-630 $\mu\mu$
Second band	587-573 $\mu\mu$
Third band	554-532 $\mu\mu$

Figure 2 shows the absorption band at 630-634 $\mu\mu$. The guide lines above are the neon lines (Page 203).

Further work showed that umbellulone produced decided hemolysis of human, guinea pig and horse blood.

Effects of Umbellulone upon the Intact Heart of the Frog—The frogs were prepared for heart recording (17) and 0.2 cc of 10 per cent umbellulone in 1 per cent acacia emulsion dropped upon the heart after a normal tracing had been obtained. Results:

Umbellulone at first produced a quickening in the heart rate which was followed by a progressive decrease in frequency, loss in tonus and a decrease in contraction of the ventricle. The heart finally stopped in diastole. It was found that the addition of 0.1 cc of 1 1000 caffeine to the washed heart produced no reviving effect. The injection of 0.2 cc of 1 1000 adrenaline hydrochloride into the right atrium also produced no reviving effect upon the paralyzed heart.

Effects of Umbellulone on the Atropinized Frog Heart—The hearts of other frogs were first treated with 0.2 cc of 1% atropine and the atropine allowed to take effect. About five minutes after the application of the atropine the excess was washed off with 0.65 per cent sodium chloride solution and 0.2 cc of 10 per cent umbellulone dropped upon the heart. There was at first a quickening of the heart rate, which was followed by a progressive decrease in frequency, loss in tonus and a decrease in contraction of the ventricle. The heart stopped in diastole.

Effects of Physostigmine on Umbellulonized Frog Heart—The hearts of frogs were treated with a 10 per cent solution of umbellulone. There was an initial increase of rate or frequency, followed by a progressive decrease in frequency, ending in apparent paralysis of heart. Several drops of 1 100 physostigmine solution were applied to the paralyzed heart, resulting in partial revival.

Effects of Umbellulone on Unanesthetized Animals—Injection

Two guinea pigs were used, each receiving an intraperitoneal injection of four cc of a 10 per cent solution of umbellulone in olive oil. Two minutes after the injection the guinea pigs showed a slight paralysis of the hind quarters. This was followed by a drop in pulse rate with a slight change in respiration which rapidly became very irregular. Both pigs showed asphyxia convulsions which became more frequent and pronounced toward the end of the experiment. Following the decrease in pulse rate there was a marked increase in the pulse which was followed by failure in respiration. The heart stopped in about a minute after respiration failure.

Post-mortem examination indicated the odor of umbellulone pronounced in both peritoneal and pericardial cavities. The heart stopped in diastole. The

heart, aorta and the superior and inferior vena cava were dilated. The lungs showed decided congestion and the blood was of a dark color.

Inhalation

Warmed umbellulone was placed in a desiccator and allowed to vaporize in the presence of a guinea pig for a period of four hours. At intervals the enclosed chamber was oxygenated. The only apparent result was irritation of the mucous membranes of the eyes and nose. The respiration was at times irregular but at no time did it show signs of failure.

EXPERIMENTAL WORK I BACTERICIDAL ASPECTS

FUNGICIDAL ACTION OF THE OIL AND THE UMBELLULONE

Method

The organisms used were *Monilia tropicalis* (1885) and *Trychophyton interdigitale* (2284).

The Food and Drug Administration method (18) was used with a standard loop for transferring to a broth of pH 5.0 for a period of five days.

The solvent (19) employed to dissolve the ketone, umbellulone, was a sterilized mixture composed of 33 parts, respectively, of 95 per cent alcohol, glycerol, distilled water and 66 parts of powdered castile soap. This solvent was tested for fungicidal action and was found to check with the reports of Miller (19).

The fungicidal action of umbellulone was determined by a modification of the method by Kingery and Adkison (20). Two cc. of the ketone solution was placed in one cc. of 24 hour broth culture and allowed to stand for the specified intervals of time (one, thirty and sixty minutes), and then transfers were made to Sabouraud's Agar medium and incubated for 48 hours and read.

Ten experiments were undertaken. Table II is a tabulation of the typical results obtained.

TABLE II

No.	Dilution	Oil of Myrtle, Time in Minutes			Umbellulone Time in Minutes		
		1	30	60	1	30	60
1885	1/10	—	—	—	++++	—	—

	1/100	++++	++	+	++++	+	—
	1/1000	++++	++++	++	++++	+	+
2284	1/10	—	—	—	++++	—	—
	1/50	+	—	—	++++	—	—
	1/100	+++	++	+	++++	+	—
	1/1000	++++	++++	++	++++	++	++

Legend to table

—	No growth recorded
+	1-4 colonies observed on the quarter
++	5-10 colonies observed on the quarter
+++	11-24 colonies observed on the quarter
++++	25 or more colonies observed on the quarter

The oil and the ketone in the absence of protein killed the specific organisms used in dilutions of 1/10 for intervals of 1, 30 and 60 minutes, but in a 1/50 dilution growth was recorded with one-minute contact for the oil of myrtle, but not for the umbellulone. In the 1/100 dilution there was recorded growth in all intervals of time for the oil of myrtle, while the ketone showed no growth on 60 minutes' contact. In 1/1000 dilution all contacts were positive.

The fact that the organisms were killed and not inhibited was demonstrated by taking a loop of each dilution for the various intervals of time, and transferring to a sterile tube of broth. No growth was recorded in 48 hours at 37° C.

FUNGICIDAL ACTION OF UMBELLULONE IN THE PRESENCE OF PROTEIN

Fifteen experiments were undertaken

Method

Organisms (1885 and 2284) and the F D A method (18) of transferring were used with the same technique as before, using media containing gelatin, peptone and 10 per cent defibrinated horse blood in Sabouraud's medium. The p_H for the respective media was adjusted to 5.5 and sterilized at 15 lbs pressure for 18 minutes.

Results

Blood Medium—In the presence of 10 per cent blood medium, organism (1885) was killed for all contacts of time intervals by 1/10 dilution. 1/100 dilution was negative in 60-minute contact, 1/1000 dilution was positive in all contacts. The same results were recorded for organism (2284).

Gelatin and Peptone Media—Organism (1885). All contacts were negative in 1/10 dilution, 1/100 dilution, 1-minute contact was positive, 30- and 60 minute contacts were negative, 1/1000 dilution, all the contacts of time intervals were positive.

Organism (2284). 1/1000 dilution on gelatin medium recorded positive in 1- and 30-minute contacts, while the 60-minute contact was negative. All other recordings were identical with those of organism (1885).

Umbellulone in the presence of protein-like materials was found to be only slightly inactivated.

NOTE. The dilutions as specified in all these experiments are as before adding to the 24-hour broth culture, in each case the original dilution was diluted one half.

GERMICIDAL ACTION OF UMBELLULONE

Method

A *Wet Filter-paper method* of the F D A (18) was employed. Organisms used were *E. typhi* (Sears) and a standard stock culture of *Staphylococcus albus*. Neither organism was inhibited or killed by 5-minute exposures to 1/70 dilution of phenol. Both organisms were killed by a 15-minute exposure in a 1/90 dilution of phenol.

Results

The accompanying Table III is typical of the results obtained.

TABLE III

Organism	Time	Dilutions					
		1/10	1/20	1/100	1/500	1/1000	1/2000
<i>E. typhi</i>	1	—	—	—	+	+	+

1 Stimulated phenol coefficient, 6.25

B The F D A Agar-Plate Method (18)—*E typhi* (Sears) and *Staph albus* were the organisms used. The ointments were composed of Umbellulone 10 per cent, 5 per cent, 1 per cent and 1/10 of one per cent, with lanolin as a base.

Results

All dilutions showed inhibitory and diffusibility action. The fact that *E typhi* and *Staph albus* were killed was determined by using a portion of the material from the clear zone of the plate and transferring to sterile tubes of broth which were incubated for 24 hours at 37° C.

II EFFECTS OF UMBELLULONE ON ISOLATED INTESTINAL SEGMENT

The following experiments were carried out by using a modification of the procedure of Salant and Mitchell (21).

Fig 2—Spectrogram of the umbellulone on guinea pig blood

Fig 3—Rabbit gut. Effect of 1 cc of 1/100 solution of umbellulone giving a dilution of 1-40 000. (A) Normal, (B) Partial paralysis, (C) Normal segment. Base line indicates two minute intervals.

Fig 4—Rabbit gut. Showing progressive loss of contraction (in dilution of 1-13 333 of umbellulone) with period of slight stimulation and complete paralysis of intestinal segment. Time—two minute intervals.

Fig 5—Rabbit gut. Intestinal segment revived in Locke's solution. Time—two minute intervals.

Method

The rabbits and cats were killed by administering an excessive dose of chloroform. The small intestines were immediately removed, care being taken to avoid injury to the intestines. The removed intestines were placed in fresh, oxygenated Locke's solution and kept at 37.5° C.

The fact that the organisms were killed and not inhibited was demonstrated by taking a loop of each dilution for the various intervals of time, and transferring to a sterile tube of broth. No growth was recorded in 48 hours at 37° C.

II EFFECTS OF UMBELLULONE ON ISOLATED INTESTINAL SEGMENT

The following experiments were carried out by using a modification of the procedure of Salant and Mitchell (21).

Fig 2—Spectrogram of the umbellulone on guinea pig blood

Fig 3—Rabbit gut. Effect of 1/100 solution of umbellulone, giving a dilution of 1-40,000. (A) Normal, (B) Partial paralysis, (C) Normal segment. Base line indicates two minute intervals.

Fig 4—Rabbit gut. Showing progressive loss of contraction (in dilution of 1-13,333 of umbellulone) with period of slight stimulation and complete paralysis of intestinal segment. Time—two minute intervals.

Fig 5—Rabbit gut. Intestinal segment revived in Locke's solution. Time—two minute intervals.

Method

The rabbits and cats were killed by administering an excessive dose of chloroform. The small intestines were immediately removed, care being taken to avoid injury to the intestine. The removed intestines were placed in fresh, oxygenated Locke's solution and kept at 37.5° C.

until used. The segments of the intestines (2.5 to 4 centimeters in length) were suspended in four hundred cc of Locke's solution through which a stream of oxygen was bubbling continuously. The temperature was maintained at 37.5° C by use of a constant temperature bath. Recordings were made on a single drum kymograph, using a Becker universal lever. The umbellulone was prepared in the form of a 1 per cent acacia emulsion. Dilutions of 1:10, 1:100 and 1:1000 were prepared for use in the experiment.

Results

Both cat and rabbit gut when treated with a 1:100,000 dilution of umbellulone showed a slight stimulation with a slight increase in contraction with tonus and amplitude remaining nearly constant.

Rabbit Gut—Umbellulone in a dilution of 1:40,000 produced a decided decrease in contraction (Fig. 3). In a dilution of 1:13,333 umbellulone produced a decided decrease in contraction tonus and amplitude. This decrease was progressive in nature (Fig. 4). On washing gut with fresh Locke's solution the segment was revived (Fig. 5).

Fig. 6—Cat gut. Effect of 1-5000 dilution of umbellulone on isolated intestinal segment. Time—two minute intervals.

resulting in paralysis of segment (Fig. 6). On washing gut with fresh Locke's solution the segment was revived.

Fig. 7—Dog. Blood pressure and respiration. Normal B.P. from right carotid artery, normal respiration. Effects from femoral vein injection of 1 cc undiluted umbellulone. Time—ten second intervals.

Fig. 8—Dog. Blood pressure and respiration. (Continuation of Fig. 7). Progressive rise in B.P., increased heart action, rapid (shallow) respiration, and intestinal stimulation. Time—ten-second intervals.

III EFFECTS OF UMBELLULONE ON RESPIRATION AND BLOOD PRESSURE

Dogs were the only animals used in this work. A total of seven dogs was used.

Method

The dogs were weighed and 1.2 cc of 40 per cent chloretone in 40 per cent ethyl alcohol (22) per Kg of body weight were injected intraperitoneally. Two and one-half hours later the dogs were prepared for blood pressure recording (23, 24) by using a Becker U tube mercury manometer for blood pressure and a Becker respiration plethysmograph for respiration. Both respiration and blood pressure were recorded on a single drum kymograph.

Results

Umbellulone, when given intravenously, in a dose of 0.109 cc per Kg of body weight produced a rapid and decided fall in blood pressure (Fig 7). This

Fig 9—Dog Blood pressure and respiration (Continuation of Fig 8) Second femoral injection (1 cc undiluted umbellulone) Effects—failure of respiration, and arrest of heart beat Time—ten second intervals

was followed by a progressive rise in the blood pressure which at no time regained the mean pressure (Fig 8). The injection of a second dose of similar size, as stated above, produced death in a few minutes with failure in respiration followed by arrest of the heart (Fig 9).

Fig 10

TABLE IV—EFFECTS OF UMBELLULONE ON THE BLOOD PRESSURE AND RESPIRATION OF DOGS

Dog	Normal		10% Umbellulone in Olive Oil				20% Umbellulone in Olive Oil				Undiluted Umbellulone				Death Resulted Min

TABLE V—CHLORETONE ANÆSTHESIA COMPARISON ON DOGS

Dogs	Age Months	Sex	Weight Kilos	40% Chloretone Cc	Anæsthesia Time Minutes
1	24	Male	17 0	20 4	8
2	12	Male	11 2	13 5	9
3	15	Female	11 2	13 5	8
4	10	Female	11 2	13 5	15
5	12	Male	11 3	13 8	8
6	9	Male	11 2	13 0	18
7	8	Male	9 7	11 0	20

NOTE Time elapsing between injection of anæsthetic and operation was 2 1/2 hours in each case

Post-mortem examination showed congestion of the lungs with blood clots. The heart stopped in diastole. The heart and the superior and inferior vena cava were dilated as were the other great vessels.

SUMMARY

- 1 Umbellulone in blood produced methemoglobin *in vitro* and *in vivo*
- 2 Umbellulone produced decided hemolysis of human, guinea-pig and horse blood
- 3 Umbellulone injected intraperitoneally in guinea pig caused asphyxiation followed shortly by death
- 4 Inhalation of umbellulone by guinea-pig irritated mucous membranes of eyes and nose caused irregular respiration at times but no failure of respiration
- 5 Umbellulone in dilutions of 1:50 killed *Mompha tropicalis*, and *Trychophyton interdigitale* in 1, 30 and 60-minute contacts. In dilutions of 1:100 the 1-minute contact was positive and the 30 and 60-minute contact negative
- 6 Umbellulone in the presence of blood, peptone and gelatine showed but a slight loss in fungicidal power
- 7 Umbellulone killed *E. typhi* and *Staph. albus* in dilutions as high as 1:500 for 15 minutes contact. The estimated phenol coefficient was 6.25
- 8 Umbellulone produced a decrease in frequency of the frog heart, loss of tonus and a decrease in the ventricle contraction. Stoppage of the heart occurred in diastole. Atropine, caffeine or adrenaline injected into the right atrium had no effect upon the paralyzed heart
- 9 Results obtained on frog heart showed that umbellulone probably acts upon the same nerves and fibres as does atropine
- 10 Umbellulone on isolated segment of rabbit and cat in 1:100,000 dilution produced slight stimulation, in dilutions of 1:40,000 or less, produced an apparent state of depression which progressed into partial paralysis. The length of time the paralysis was in effect depended on the degree of concentration of the solution, the more concentrated the solution the longer and the more complete the paralysis
- 11 Intravenous injections of umbellulone caused a lowering of blood pressure and failure of respiration in dogs
- 12 The clinical results and post-mortem examinations indicated that
 - a Umbellulone probably acts as a depressant
 - b Umbellulone produces rapid methemoglobin

- c Umbellulone apparently caused pulmonary circulation to be blocked
- d Umbellulone causes vaso-dilation of the heart and large vessels
- e The minimal lethal dose of umbellulone in dogs is about 0.178 cc per Kg of body weight, death being due to failure of the respiration followed in a few minutes by stoppage of the heart

FURTHER STUDIES ON PSYLLIUM SEED * 1

BY HEBER W YOUNGKEN

In an article entitled "Studies on Commercial Psyllium Seeds" which appeared in Vol XXI, No 12, pages 1265-1273 of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, the writer discussed some earlier studies he had made on various commercial varieties of Psyllium. Since that time he has examined new lots of Psyllium seeds imported from Spain and France. He has also studied plants with mature fruit and seed bearing spikes from growers of commercial Psyllium seeds in France and Spain, and has compared these materials with authentic

* Scientific Section, A PH A, Washington meeting, 1934

1 Massachusetts College of Pharmacy

herbarium specimens in local herbaria and with standard descriptions of the species involved by Post (1), Reichenbach (6) and Hegi (2), thus enabling identification of the plants. Commercial seeds of *Plantago psyllium* L and of *Plantago arenaria* Waldst et Kit [*P. ramosa* (Gilibert) Aschers] were planted in pots in a greenhouse and plants reared therefrom which compared favorably with descriptions of these species in the literature.

The seeds from a large number of recent commercial lots of Psyllium labeled French and Spanish Psyllium were also compared with seeds obtained from the fruits of the identified mature plants furnished by French and Spanish growers of Psyllium and the sources of four different kinds of seeds definitely established. It was found that most of the samples (in original packages with a Spanish label) labeled "Spanish Psyllium" were yielded by *Plantago psyllium* L, a few by *Plan-*

branches $\times \frac{6}{13}$

tago arenaria Waldst et Kit and a number (with English labels) by *Plantago lanceolata* L, the last species being also the source of German Psyllium, also that most of the more recent "French Psyllium" samples were yielded by *Plantago arenaria*, a number by *Plantago psyllium* while occasional lots contained mixtures of *P. arenaria*, *P. psyllium* and *P. Cynops* or of *P. arenaria* and *P. Cynops*. It has also been ascertained that the seeds of *Plantago lanceolata* L, previously described by the writer (4) are torrefied abroad and mixed with untoasted seed of *Plantago arenaria* and offered in this combination to the American trade as French or Black Psyllium Seed.

A binocular dissection microscope was employed in the examination of the external morphology of the seeds. Cross sections were then made through the region of the cotyledons and raphe, mounted in glycerin and alcohol as well as in water and then studied under the compound microscope. The mucilage swelling factors were ascertained by the method outlined in a previous paper by the author (3).

From the studies made, the following descriptions are given for three authentic seeds of caulescent species of *Plantago* variously found in lots of French and Spanish Psyllium seeds

PLANTAGO PSYLLIUM SEED

The seeds examined were hemianatropous, silky to the touch, ovate to ovate elongate, larger at one extremity than the other, concave convex, light brown to chestnut brown, dark brown along the margin, very shining, mostly from 1.28 mm to 2.72 mm in length, rarely up to 3 mm, and from 0.6 to 1.12 mm in breadth, the convex dorsal surface smooth, somewhat transparent and showing beneath the seed coat a light brown longitudinal area representing the straight embryo, extending nearly the length of the seed, the hypocotyl being in the broader end and the cotyledons in the narrower end, the concave surface showing a large cavity, limited by the border which is raised as a cushion. The curved edge of the cushion forms a pointed, obtuse or right angle with the internal face of the cavity. In the center of the base of this cavity is an oval white scar representing the hilum. Occasionally, the raphe is present attached to one edge of the seed. A transverse fissure or groove is usually visible on the convex side and edges of most of the seeds. This is nearer the broader than the narrower extremity, and just over the point of union of hypo-

Fig 3—*Plantago cynops*
L. $\times \frac{5}{13}$

Fig 4—Seeds of *Plantago psyllium* L. $\times 10$

cotyl and cotyledons. On the broader end of the seed may be seen the dark brown marks of the fusion of the seed coat at the end of the groove. The seeds are silky to the touch. 100 seeds weighed 0.072 Gm.

Upon soaking the seed in water, the seed coat swelled and the seed became enveloped with a transparent, colorless mucilage. When the swelling phenomenon is observed under the microscope, it is noted that the epidermal cells elongate and their outer and radial walls become transformed to mucilage. The mucilage swelling factor in 24 hours varied from 12 to 16, and in 48 hours was up to 35.

Histology—Transverse sections of *P. psyllium* seed cut through the central region possess a reniform outline and present for examination a spermoderm, endosperm and embryo. The spermoderm shows (1) an outer epidermis of mucilaginous epidermal cells with more or less obliterated walls in glycerin mounts the radial and inner walls of which swell and disintegrate to form a clear mucilage upon irrigation of the mount with water, (2) a pigment layer with brown amorphous content. Directly beneath the spermoderm lies the broad endosperm, composed of irregular shaped, thick-walled cells with walls of reserve cellulose and intercellular-air-spaces. The outer layer of this region consists of palisade cells which range from 15μ to 34μ , rarely

to about 40μ in height. The contents of these endosperm cells consist of aleurone grains and fixed oil.

The straight embryo lies in the center of the endosperm and consists of 2 elongated, plano convex cotyledons and a cylindrical hypocotyl. The cells of the embryo contain aleurone grains of varying shape up to 8μ in diameter and fixed oil. Three plerome bundles extend through the mesophyll of each of the cotyledons.

Fig 5—Seeds of *Plantago arenaria* W et K $\times 9$

PLANTAGO ARENARIA SEEDS

The seeds observed differed from those of *P. psyllium* by the following characters:

They were darker brown to maroon in color, ovate oblong to elliptical, less shiny often dull, and rough and reticulate on the outer surface with a median transverse groove or fissure or dent more distinct and usually nearer an equal distance from the two extremities than in *P. psyllium* and *P. cynops* seeds. The ventral or concave surface shows averagely a broader cavity than in *P. psyllium* seed and the edge forms a somewhat flattened cushion instead of a rounded one. Moreover, as François (5) has shown, this edge forms a sharp

indented angle with the base of the cavity. The size of *P. arenaria* seeds ranged from 1.6 mm to 3 mm in length and from 0.96 mm to 1.5 mm in breadth. The hilum at the bottom of the cavity was pale brown to occasionally whitish. 100 seeds weighed 0.0842 Gm. Their mucilage swelling factor in 24 hours was averagely 8, whereas that of *P. psyllium* seed was averagely 14 and varied from 12 to 16. The palisade cells of the endosperm were from 15μ up to about 52.5μ in height.

PLANTAGO CYNOPS SEEDS

This seed is larger than those of the other two species, ranging from 3 to 4 mm in length and up to 2 mm in breadth. It is ovate oblong, enlarged at one extremity and strongly contracted at the other, dull brown to dull greenish brown, with a transverse depression nearer the broader than the narrower end. It is convex on the dorsal surface with a broad deep concavity on the ventral surface which is open at the contracted end. The edges are curved into the cavity. A whitish hilum is found at the base of the ventral cavity. 100 seeds weighed 0.1649 Gm. The palisade cells of its endosperm were from 15μ to 48.75μ in height.

Fig 6—Transverse section of *Plantago arenaria* seed $\times 40$

Ep, epidermis and Pgl, pigment layer of seed coat, Pal, palisade layer of endosperm, End, inner region of endosperm which contains fixed oil and aleurone but no starch, PC, protoplasmic connections between inner endosperm cells, Cot, Ep, epidermis of cotyledon, Meso, mesophyll of cotyledon, PI, plerome bundle, R, raphe.

The mucilage swelling factor of one lot taken after 24 hours was 1 and after 48 hours 1.5. The writer anticipates additional work on the mucilage swelling factor of this seed as more material becomes accessible.

CONCLUSIONS

1 It is ascertained that good French and Spanish *Psyllium* Seeds of the current American market are yielded by *Plantago psyllum* and *Plantago arenaria*

2 *Plantago psyllum* seed is superior to *Plantago arenaria* seed in mucilage swelling capacity

3 Most of the French *Psyllium* seed is now yielded by *Plantago arenaria*, less by *P psyllum* while occasional lots contain mixtures of *P arenaria*, *P psyllum* and, rarely, *P Cynops*

CRYSTALLINE FORMS OF EPHEDRINE ALKALOID *

BY E E MOORE AND D L TABERN

Ephedrine alkaloid as it appears on the market was found to exist in two forms, one containing about 95 per cent of the alkaloid, and five per cent of water, while the other assays nearly 100 per cent. Although the former is crystalline, while the latter is usually an oil or a rock-like solid, assays of the latter indicated that the more nearly the composition approached the anhydrous, the higher the melting point

Emde (1) reported an ephedrine hydrate containing about 10 per cent of water which would correspond to one mol of water for each mol of ephedrine. However, samples of hydrated ephedrine obtained from different manufacturers, or prepared by recrystallizing the alkaloid from water, were assayed in this laboratory and found always to contain about 5 per cent of water. This would correspond to a hemi-hydrate, rather than a hydrate.

The purpose of this work was to prove that the hemi-hydrate is the usual hydrate of ephedrine, to determine the melting point of anhydrous ephedrine, and to ascertain the effects of different amounts of water on this melting point

* Abbott Laboratories, North Chicago, Ill

Received October 17, 1934

METHOD

Ephedrine alkaloid N N R was distilled at 25 mm. Any water which was present came over quickly. When the temperature reached 150°, the receiver was changed and distillation continued. The anhydrous base boiled over within the range, 151–153°. A number of different distillates solidified within the range, 38.0–38.1°.

Fifteen to 30 Gm. of the molten anhydrous alkaloid obtained above accurately weighed was placed in a small round bottom flask, fitted with a stopper having holes for an Anschutz thermometer and a stirring rod. The apparatus was cooled to 30° C. and the ephedrine seeded with a small crystal of anhydrous base. The mass was stirred and the temperature rose to a constant value—the solidification temperature—where it remained for some time.

The mass was melted, a known weight of water added and incorporated thoroughly with the ephedrine. The solidification temperature was determined by the same procedure used for the anhydrous base.

The above was repeated, adding successive small quantities of water, until the desired number of values was obtained.

Three such experiments were carried out, using different samples of anhydrous base and the points obtained were found to fall on the same curve. (Table I), (Curve I), Fig. 1.

Fig 1 —Solidification temperature

Fig 2

The values for the anhydrous base and for the base with a half mol. of water were checked by melting point determinations.

The solidification temperature can be determined with as little as 2 Gm. of ephedrine, if a small insulated test tube is employed as the container. This modified technique has been found to be very useful as a rapid method of determining the purity of the alkaloid.

Anhydrous ephedrine melts at 38.1°. The addition of water lowers the melting point until with 1.5 per cent a eutectic mixture, ephedrine-ephedrine hydrate melting at 32.1° is obtained. Further addition of water raises the melting point until with five per cent a maximum of 40° occurs. The composition of this last substance corresponds closely to that of a hemi-hydrate.

Incidental to the purification of anhydrous ephedrine base by distillation, the boiling point was determined at various pressures in the range of 65 and 760 mm. (Table II), (Curve 2), Fig. 2. This supplements the data between 7 and 25 mm. reported in the A. D. M. A. proceedings for 1933. (2) Above 250° slow decomposition seemed to ensue.

TABLE I—SOLIDIFICATION TEMPERATURES SYSTEM, EPHEDRINE-WATER

145	205	7	127-128

When the distilled anhydrous base was crystallized from an anhydrous medium, such as dry ether, crystals were obtained which analyzed 100 per cent ephedrine. When crystallized from water or dilute alcohol, the crystals analyzed 95 per cent.

The anhydrous crystals were very hygroscopic, while the hydrated material did not tend to take up or give off water.

Dr George L. Clark has kindly studied the crystalline forms of the anhydrous and hydrated bases and found them to be different.

SUMMARY

Crystalline anhydrous ephedrine was prepared and its melting point determined.

The existence of a hemi-hydrate of ephedrine containing 95 per cent of the base was proved. The anhydrous and hydrated alkaloids differ in crystalline form, melting point, stability and solubility in oil.

The effects of different amounts of water on the melting point of ephedrine were determined.

DISPENSARY SERVICE

Dispensary service owes its existence to the great London fire in 1666. The Pennsylvania Hospital established the first dispensary in this country (1751).

PHYTOCHEMICAL NOTES

FROM THE LABORATORY OF EDWARD KREMERS

No 111 THE STEROLS FROM MONARDA FISTULOSA

BY OLE GISVOLD

The unsaponifiable material prepared by E J Ireland from the saponified fatty oil obtained from the leaves of the wild bergamot was imperfectly crystalline. The several fractions submitted were combined, dissolved in ether, alcohol added to the ethereal solution, also some charecoal. The mixture was heated to boiling for a few moments and then filtered. After filtration, the ether was evaporated off and water added to the hot solution until the precipitate produced just redissolved.

Upon recrystallization beautiful leaflets were thus obtained. They melted at 130–131° and showed no change in melting point after drying at 100° also over P₂O₅ in a vacuum.

The sterol was acetylated. The acetylated product, upon crystallization, melted at 115°. Upon recrystallization the product softened at 115° and became clear at 118°.

The absence of stigmasterol was indicated when tested for by the method of Windaus and Hauth.¹ However, reinvestigation of larger amounts, when available, may yet prove the presence of stigmasterol with a sitosterol.

The Therapy of the Cook County Hospital Edited by BERNARD FANTUS, M D, Chicago—In their elaboration, these articles are submitted to the members of the attending staff of the Cook County Hospital by the director of therapeutics, Dr Bernard Fantus. The views expressed by various members are incorporated in the final draft for publication. The series of articles will be continued from time to time in the columns of the *Journal A M A*.

The following prescriptions were selected from one of a series of articles in the *Journal A M A* by the *Prescriber* and edited by this publication in accordance with the *British Pharmacopœia*.

RUBEFACIENT PIGMENT

R ¹ Menthol	2 0 Gm
Volatile Oil of Mustard	2 0 ml
Alcohol (95 per cent)	50 0 ml

Mix Apply a few drops to the affected area
(Avoid the vicinity of the eyes)

ANALGESIC PIGMENT

R ¹ Camphor	
Chloral Hydrate	
Menthol, of each	30 0 Gm
Alcohol (95 per cent) to make	120 0 ml

Mix Paint over painful area

COMBINED ANALGESICS

Dry Extract of Hyoscyamus	0 15 Gm
Acetanilid	1 00 Gm
Acetylsalicylic Acid	5 00 Gm

Mix and divide into 15 capsules. One every two to four hours as required. (The analgesic effects of acetanilid and acetylsalicylic acid are enhanced by this combination and the sudorific effect is arranged by the hyoscyamus.)

BENZOCAINE CAMPHOR OIL

R ¹ Benzocaine	2 0 Gm
Liniment of Camphor to make	100 0 ml

Mix Apply freely on gauze as a dressing for painful wounds or ulcers

¹ *Ber*, 39, 4381 (1906)

EMINENT AMERICAN PHARMACOGNOSISTS OF THE NINETEENTH CENTURY

BY HEBER W YOUNGKEN

(Concluded from page 152, February Journal)

ALBERT SCHNEIDER (1863-1928)

Albert Schneider was born in Granville, Illinois, April 13, 1863. His boyhood days were spent on his parent's farm in McLean County, Illinois, where he worked during the summer and attended the district schools for a few months each winter. At the age of seventeen he entered Valparaiso, Indiana Normal School, where he intended to prepare for medicine but was compelled to relinquish his studies after about six months on account of an attack of inflammatory rheumatism. After recovering he entered the Dixon, Illinois Normal School and completed his preparatory studies. He then went to Chicago for the study of medicine. He was graduated from the College of Physicians and Surgeons of Chicago in 1887, the same year he received his Bachelor of Science degree from the University of Illinois. He took graduate work at the University of Minnesota and obtained his M Sc from that institution in 1894, and his Ph D from Columbia University in 1897. He held the Fellowship in Botany at Columbia for two years, making a special study of Lichens. During a portion of his stay at the University of Minnesota he served as Instructor in Botany in that institution.

ALBERT SCHNEIDER

After graduation from Columbia he was called to the chair of Pharmacognosy and Bacteriology in the Northwestern University School of Pharmacy where he remained until 1903. From 1903-1919 he served as professor of Pharmacognosy and Bacteriology, and from 1904-1906 as professor of *Materia Medica* and Therapeutics in the University of California. While there he also filled outside positions. From 1906-1907 he was director of the Spreckel's Sugar Company Experiment Station, and from 1909-1915 pharmacognosist for the U S Dept of Agriculture, from 1915-1919, microanalyst of the California State Food and Drug Laboratory, and from 1910-1915 was editor-in-chief of the *Pacific Pharmacist*. In 1919, he resigned his position at the University of California to accept the chair in Pharmacognosy at the University of Nebraska which he held until 1922 when he was called to the position of dean of the School of Pharmacy of North Pacific College, Portland, Oregon. He served for many years as a member of the Revision Committee of the United States Pharmacopœia on which he helped draft the monographs on powdered vegetable drugs. He was president of the American Conference of

Pharmaceutical Faculties from 1913-1914, and lecturer for several years in the Portland Police School and summer school of the University of California on crime investigations

Professor Schneider's activities covered a wide field, he possessed a profundity of thought and a versatility of knowledge. He was always outspoken with his opinions. He was a frequent contributor of scientific articles upon microscopical subjects in which he was an investigator of marked ability. He also wrote on Coto, Paracoto, Winter's Bark and many other themes. His outstanding works were as follows: "Primary Microscopy and Biology," 1890, "Text-Book on General Lichenology," 1897, "Guide to the Study of Lichens," 1898, "Microscopy and Micro-Technique," 1899, "Hints on Drawings for Students of Biology," 1899, "General Vegetable Pharmacography," 1900, "Powdered Vegetable Drugs," 1902, "Bird and Nature Study Chart Manual," 1903, "Medicinal Plants of California," 1909, "Pharmaceutical Bacteriology," 1920, "The Microbiology and Analysis of Foods," 1920, and a "Translation of Westermaier's Compendium der Allgemeinen Botanik," 1896

Dr Schneider became internationally known for his work in the later years of his life on crime detection. He was an inventor of a lie detector, and also of a ventilating system for Pullman cars.

He died suddenly as a result of a cerebral hemorrhage on October 27, 1928, while on his way to the college.

HENRY KRAEMER (1868-1924)

Henry Kraemer was born in Philadelphia, Pa., July 22, 1868. He received his early education in Girard College from which he graduated in 1883. He then entered the drug store of Dr. Clement B. Lowe where he served an apprenticeship of five years, attending the Philadelphia College of Pharmacy during part of this apprenticeship from which institution he was graduated in 1889 with honors. During his senior college year and the following year he served as assistant in general chemistry to Professor Sadtler at the University of Pennsylvania.

HENRY KRAEMER

In 1890 he became Instructor in Botany and Pharmacognosy in the College of Pharmacy of the City of New York. Desiring further training in the natural sciences, he took a special course in botany at Barnard College and in 1891 entered the School of Mines of Columbia University from which he graduated with a Ph.B. in 1895. While a senior at Columbia he was elected Professor of Botany, Pharmacognosy and Materia Medica in the School of Pharmacy of Northwestern University with one year's

leave of absence before entering on his duties. He spent this year abroad at the

University of Marburg (Germany) studying under Meyer, Cohen, Zincke and Melde, and received the degree of Ph D cum laude in June 1896 His doctorate thesis was on "Viola tricolor" He then assumed his duties at Northwestern University but resigned at the end of the year to accept the chair in Botany and Pharmacognosy at the Philadelphia College of Pharmacy in the Fall of 1897

In 1899 he became editor of the *American Journal of Pharmacy*, succeeding Professor Henry Trimble, and he made a large number of contributions to this *Journal* during his nineteen years of editorship

While at the Philadelphia College of Pharmacy he became a voluminous contributor to the literature of botany and pharmacognosy He wrote textbooks on botany and pharmacognosy, applied and economic botany, and scientific and applied pharmacognosy, he also published many papers on a variety of topics pertaining to pharmacognosy, the outstanding of which are as follows "Calcium Oxalate Crystals in the Study of Vegetable Drugs," "Effect of Heat and Chemicals on the Starch Grain," "Some New Methods in the Study of the Commercial Starches," "Valuation of Vegetable Drugs and Foods," "Microscopical and Chemical Examination of Cloves," "Assay of Drugs by the Use of Living Plants," "The Nature and Structure of Cochineal," "Substitution of the Fruits of *Rhus Typhina* for *Rhus Glabra*," "Histology of the Rhizome and Roots of *Phlox Ovata*," "Adulteration of *Marjoram* and *Coriaria*," "Some of the Distinguishing Morphological Characters of *Belladonna* and *Scopolia*," "Plant Colors," and "Color Standards of Powdered Vegetable Drugs"

In addition to his regular courses, he introduced and carried on special courses at the college on the microscopical examination of foods and technical products and in bacteriology He was always popular with his students, many of whom sought his counsel

In 1900 he became a member of the Committee of Revision of the United States Pharmacopœia and was made chairman of the Sub-Committee on Botany and Pharmacognosy which position he held through the revision period of 1910 and a portion of the period of 1920 He was president (in 1917) of the American Conference of Pharmaceutical Faculties and the Philadelphia Botanical Club

In 1917 he resigned his position at the Philadelphia College of Pharmacy to become Dean and Professor of Pharmacognosy at the University of Michigan In 1920 he resigned from this position and moved to Mount Clemens, Michigan, where he opened an office and laboratory as a consulting bacteriologist and chemist He died at Mount Clemens, September 9, 1924

LUCIUS E SAYRE (1846-1924)

Lucius Elmer Sayre was born in Bridgeton, New Jersey, November 2, 1846, where he received his early education in the public schools and as an apprentice in the drug store of Robeson and Whitaker In the early sixties he came to Philadelphia and clerked in the drug store of Dr L Updycke while attending the Philadelphia College of Pharmacy from which he graduated in 1866 He then obtained a position in the pharmaceutical laboratory of Frederick Brown and, later, with Henry C Blair's Sons, Apothecaries, in Philadelphia

Sayre was a close friend and classmate of Professor Remington and in 1879 they opened a drug store as partners at 18th and Market Streets, Philadelphia, in which they manufactured a number of pharmaceuticals including scale pepsin. During the partnership, Sayre became a quiz master in materia medica of the Alumni Association of the Philadelphia College of Pharmacy and lecturer on pharmacy in the Women's Medical College of Philadelphia.

Upon the founding of the School of Pharmacy at the University of Kansas in 1885, Mr Sayre was elected dean and also professor of Materia Medica and Pharmacy. In 1907, Professor Sayre became director of drug analysis for the Kansas State Board of Health and a member of the botanical staff of the Kansas State Board of Agriculture.

LUCIUS E SAYRE

He received an honorary Bachelor of Science degree from the University of Michigan in 1896 and the Master of Pharmacy degree from the Philadelphia College of Pharmacy in 1897. He was a member of the Revision Committees of the United States Pharmacopœia of 1890, 1900 and 1910, chairman of the Scientific Section in 1893 and of the Historical Section of the A. P. H. A. in 1917, and president of the AMERICAN PHARMACEUTICAL ASSOCIATION, 1919-1920.

Professor Sayre contributed a variety of papers embracing historical, botanical, pharmacognostical and chemical subjects. He was especially interested in the proximate analysis of vegetable drugs and foods. He wrote several papers on the alkaloids of Gelsemium and others on the analysis of *Gymnoeladus* Seed, "Assay of *Datura Stramonium*," "*Caetus Grandiflorus*," "Drug-Eating Insects," "Drug Culture," "Euphrasia," "Oregon Balsam," "Golden Seal Gardens," "Characters of Distinction of *Viburnum Prunifolium* and *Viburnum Opulus*," and "Viburnum Barks, Microscopical Distinctions." He collaborated with D. H. Robinson, professor of Latin at the University of Kansas, on Robinson's Latin Grammar of Pharmacy and Medicine. His best known work was "Organic Materia Medica and Pharmacognosy" which extended through four editions.

He died at Lawrence, Kansas, on July 21, 1924. Professor Sayre was a leader in the development of the teaching of materia medica and pharmacognosy, a modest yet impressive worker, and a great figure in American Pharmacy.

OTTO A. WALL (1848-1922)

Otto Augustus Wall was born in St. Louis County, Missouri, on September 27, 1848, the son of a German clergyman. He received his early education in the schools of St. Louis and in 1864 entered the drug store of Dr. Sanders. During his apprenticeship under Dr. Sanders he attended the St. Louis College of Phar-

macy from which institution he graduated in 1868. He then entered the Missouri Medical College, receiving his M D in 1870. He also graduated from the Bellevue Hospital Medical College, New York, in 1871. From 1869-1873 he was proprietor of a drug store in St. Louis.

Upon returning to St. Louis he became professor of *Materia Medica*, Pharmacognosy and Botany in the College of Pharmacy, a position which he held for forty-nine years. He was also professor of Therapeutics and *Materia Medica* in the Missouri Medical College.

In 1882 he and Dr. Oldberg established the Oldberg-Wall Laboratory. At one time he was a member of the editorial staff of the *National Druggist* and editor of the college publication. He was a member of the U S P convention from 1880-1920 and a member of the U S P Revision Committee 1880-1900, and presided over the U S P convention of 1910. He was also president of the Missouri Pharmaceutical Association from 1883-1885.

Dr. Wall was a large man with an impressive bearing. He was affable and warm hearted, very apt with the pen and brush and an excellent parliamentarian. His brain was a vast storehouse of facts covering a wide field of general knowledge and he was a very popular teacher. He was noted for the study of sections of drugs with the microscope and for making lantern slides of these.

His best known contributions in pharmacognosy are his "Notes on Pharmacognosy," and "Handbook of Pharmacognosy," the fifth edition of which was revised in 1928 by Professor Leo Suppan. Wall was also author of "The Prescription," "Latin for Pharmacy and Medical Students," "Sex Worship," etc. He was co-author with Dr. Oldberg of "The Companion to the Pharmacopœia." He also wrote a number of papers, the last of which entitled "Vegetable Taxonomy" was presented at the 1916 meeting of the A. P. H. A.

Professor Wall died of heart failure on February 13, 1922, in his 76th year.

OTTO A. WALL

MEETING OF THE NATIONAL ACADEMY OF SCIENCES AND OF THE EXECUTIVE COMMITTEE OF THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

The annual stated meeting of the National Academy of Sciences will be held under the presidency of Dr. W. W. Campbell, in the building of the academy at Washington, on April 22nd, 23rd and 24th. The autumn meeting will be held at the University of Virginia on November 18th, 19th and 20th.

The spring meeting of the Executive Committee of the American Association for the Advancement of Science will be held in New York City on April 14th. Communications to be brought to the attention of the committee should be sent to the permanent secretary, the Smithsonian Institution Building, Washington, D. C.

HISTORY OF HAMAMELIS (WITCH HAZEL),*¹ EXTRACT AND DISTILLATE

BY JOHN URI LLOYD AND JOHN THOMAS LLOYD²

In 1865, the senior member of the writers of this treatise was acting as clerk in the establishment of W J M Gordon and Brother, Ninth and Central Avenues, Cincinnati, Ohio

Mr Gordon specialized in physicians' supplies, and made a feature of the "Concentrations" and other Eclectic preparations, then rapidly coming into favor. This was natural, as the Gordon establishment was but two blocks from the Eclectic Medical Institute, Court and Plum Streets. Drs King and Scudder, and other professors of the Institute, were patrons of the Gordon establishment, and contributed, constantly and helpfully, to Mr Gordon's pharmaceutical researches. They naturally fraternized with the physicians of other schools, who met in Gordon's large, comfortable and hospitable front room, where all, alike, considered themselves at home. A "No Man's Land" it was, but one of cheer and helpfulness, not of war, personalities and misrepresentation. The physicians who there met, differed in views, but they personally respected each other's ideals and processes. They had no desire to suppress the efforts of others who were endeavoring to serve the needs of the American people. That was left to medical politicians.

At that time, 1865, Mr Gordon had in his employ a business representative named Leon Hurtt, a brother of F W Hurtt, a banker in New York City. Through Leon, F W Hurtt proposed to purchase the right to make the preparation then known as "Pond's Extract." The senior writer of this chronicle well remembers when, in his presence, Leon Hurtt informed Mr Gordon (who, I was told, had declined to purchase the Pond Extract rights) that he wished to resign his position with the Gordons, to devote his time to the introduction and sale of the proprietary medicine, "Pond's Extract," it was then used almost exclusively by the Homeopathic medical profession of America, being scarcely known either to other physicians, or to the public generally.

In one of my visits (J. U. L.) to Los Angeles, California, I learned that Leon T Hurtt was yet living, a resident of that city. I located his home, and in 1915 made him a personal visit, with the object of obtaining from him an authoritative statement concerning the history of Pond's Extract, as well as his connection therewith. In this and other later visits, he gave me in detail the history of the preparation, which was first a water-made extract, but is not now an "extract," although established and sometimes sold under that title. I have not hesitated to utilize Mr Hurtt's words verbatim, as a part of this paper.

To the foregoing I will add that in my opinion the story herein told could not, at the date of my interview with Mr Hurtt, have been handled authoritatively by

* Section on Historical Pharmacy, Toronto meeting, 1932

¹ Especially as related to the distillate, known first under the name "Golden Treasure," then as "Pond's Extract," and next as "Aqua Hamamelidis" (U. S. P. IX) and 'Fluid Extract of Hamamelis' (N. F. V.)

² The illustrations presented in this treatise, unless otherwise credited, are by John Thomas Lloyd. The Hamamelis shrub was photographed by him in the New York location where the Oneida Indians lived and the experimental supplies mentioned in this article were obtained by him from the Oneida section.

any other person, he being the only living "charter member" of the organization originally known as the "Pond's Extract Company"

Pond's distilled hamamelis was quietly introduced into the Homeopathic school of medicine. Coming gradually into the practice of Eclectic physicians, creeping into that of Allopathic physicians, it finally came into the use of the public generally. The chemist, finding little in the distillate other than alcohol and traces of an essential oil, accepted that distilled hamamelis must, if it had any virtues, depend on the water and the alcohol it contained.

And yet, after many decades have passed, distilled hamamelis stands firmly entrenched as one of the most popular of physicians' favorites, being also largely employed as a toilet application in America. And that, too, in the face of resistance by authority such as Dr. John Marshall, and H. C. Wood, of Philadelphia who, in 1886, made a strenuous scientific laboratory investigation of hamamelis, deciding that there was nothing of therapeutic value in the distillate. Their article ended as follows:

This much used, and still more lauded witch hazel, or the so-called distillate of witch-hazel, must depend for its virtues upon the alcohol they contain, and the faith they inspire." This view is upheld by the *United States* and the *National Dispensatories*, as follows:

"As whatever slight therapeutic virtues witch hazel possesses seems to depend on its tannin it is obvious that this distillate cannot represent the drug." *U S Dispensatory*

'The good that it exerts in the treatment of sprains, bruises, wounds, chilblains, sore eyes, headache, and a host of other conditions, resides more in the activity of a cleansing and evaporating lotion and in the mind of its user, than in any decided curative properties that the preparation may possess.' *National Dispensatory*, 1916

In this connection, I am of the opinion that no claim is made by any maker of the distillate that it represents the fixed astringent principles of the drug. Nor am I convinced that alcohol is the only serviceable content of the distillate.

'Golden Treasure'

As written by Leon T. Hurtt, of the Pond's Extract Company

(Edited slightly in phrase directions L.)

"In the early 1840's, Theron T. Pond, a resident of Utica, New York, became interested in and associated more—or less, with a tribe of Indians known as the Oneida tribe then located in Central New York. He found that they were using for burns, boils and wounds of every description a 'tea' made by their Medicine Man from a species of bush known as 'witch hazel'—a shrub supposed by them to grow only in Central New York. The Medicine Man made his extract by steeping the shrub in an ordinary teakettle. The liquid which he obtained was colored but as clear as water, and had a peculiar aroma obtained from no other shrub.

The 'Witch Hazel' is peculiar (Cuts B & C) in that it blossoms in the fall, producing small, yellow flowers. The medicinal properties of the extract were, in the opinion of the Oneidas, remarkable. A sudden electrical and thunder storm (it was stated) would turn the liquid milky, but within forty-eight to seventy hours it would return to its original clearness.¹

"Mr. Pond, believing in the wonderful medicinal properties of the 'Witch Hazel' tea, decided to learn from the Indian doctor the peculiar species of shrub used. With the Indian Medi-

¹ This needs corroboration. J U L

cine Man he spent several months, searching the underbrush until he fully informed himself of the shrub they employed. He then formed with the Indians a sort of partnership to make the extract, putting it up in a shape to be sold among their friends.

Fig. A—Indian medicine man

"The Medicine Man was extremely particular about the species of shrub used, and its manipulation. He would gather it himself in the woods, bringing it in by the armful, and steeping it at once.

'At first they boiled the shrub in an ordinary iron kettle or cauldron, over a direct fire. Thus they produced a fair article, but they could not preserve it. After studying different preservatives, they finally used about 3% alcohol, but in warm weather that amount of alcohol failed to keep the product, and the alcohol was increased.

They decided to give to their extract the trade name, *'Golden Treasure,'* a name suggested by Mr. Pond. After his death, this name was changed to 'Pond's Extract.'

'Mr. Pond and the Medicine Man worked together for several years, introducing the product mainly among their personal friends. They finally decided to put the 'Extract' on the market, and did so, in a local way, in 1848. When we sold the Pond's Extract Company, in 1898, there was in the company's safe a two ounce bottle, made in 1848, which was apparently still good. Whether that bottle can now be found, I do not know.

Theron T. Pond died some time between 1847 and 1850. It is said that he lost his life from exposure in the woods.

Between 1846 and 1850, Pond and the Indian Medicine Man sold their business to Hart and Munson, iron foundry men of Utica, New York. They took in with them Isaiah A. Palmer, a friend and neighbor of Theron T. Pond. The business was next sold to a firm in New York

whose name I have forgotten, but as no business of any consequence resulted, the company was sold by the sheriff. It was bought in by Isaiah A. Palmer, who claimed never to have sold his interest therein. It should here be repeated that Palmer, Hart and Munson had given the product the name 'Pond's Extract,' dropping the name 'Golden Treasure.'"

'Dr. Frederick Humphrey, a Methodist minister, and also a Homoeopathic physician, proprietor of the Homoeopathic Medicine Company, 562 Broadway, New York, claimed that for years he had been Mr. Pond's family physician, and that Pond had given him the right to manufacture and sell the extract through his 'Humphrey Homoeopathic Medicine Company.' He did indeed, commence to manufacture the same, continuing the name, 'Pond's Extract.' His claim was denied by Palmer, who commenced suit and applied for an injunction forbidding Humphrey from either using the name 'Pond's Extract,' or manufacturing the article.

"A party from Connecticut who had worked for the original firm of Pond and the Indian, also claimed that he had the right to make 'Golden Treasure,' but he was unable to establish his claim.

At that time the 'extract' was still made by using the old cauldron, over a direct fire. Palmer employed a copper kettle, with a very crude concentrating hood and worm. Cold water was used for condensing the vapor.

"In 1871 or '72, while the lawsuit (*Palmer vs. Humphrey*) was still pending, Mr. F. W. Hurtt, a banker of New York, bought the interest, or the alleged interest, of the Humphrey Homoeopathic Medicine Company, and to quiet Palmer, took him into partnership, giving him an eighth interest in the new corporation, which was capitalized at \$100,000.00. At that time, the sale of Pond's Extract was less than \$5000.00 per annum.

'Harry Cole, of Cincinnati, myself and F. W. Hurtt of New York, bought the concern, which we reorganized, electing F. W. Hurtt *President*, L. H. Hurtt, *Vice President*, Harry Cole,

Treasurer, and I A Palmer, *Manufacturer* We transferred the company from 562 Broadway, New York, to 76 Williams Street, New York, the firm name now being, F W Hurtt and Brother, Wholesale Druggists The company then had three factories, small and crude, with four kettles at each factory One of these factories (all in New York State), was located at Tightsville, one at Little Falls, and one at Frankfort These three factories I consolidated into one, at Rome, New York, and for four years ran that factory from November, each year, until April or May

"In the meantime Isaiah A Palmer had died, and E D Palmer, the sculptor, became interested with us However, besides holding the office of vice president and running the drug department after I A Palmer's death, I added to my other duties the manufacturing of the Extract

"We then moved from Rome New York, to Chester, Connecticut, the only other locality I knew where the Indian species of Witch Hazel was obtainable¹ I immediately decided to build steam stills,² believing that I could obtain better extract from the shrub than I could with the old-time direct fire, copper kettles This I proved by making an extract nineteen per cent stronger than we had before obtained

"About a year after our purchase of their alleged interest from Dr Humphrey and the Homeopathic Company, Humphrey's Medicine Company sued us for reformation of contract and

Fig B—Witch-hazel
flowers

Fig C—Witch hazel twig showing leaves and
fruit

agreement We in turn enjoined them from using the term 'Pond's Extract,' or from manufacturing that product This lawsuit was in the court for several years

"The day after our charter was issued by the Secretary of State, our president, F W Hurtt, started on a trip around the world It then became my duty to assume the entire responsibility of the company We ran the Extract in connection with our wholesale drug business (F W Hurtt & Brother), but the establishment was inadequate for both the drug and medicine, and the Pond's Extract business We therefore leased a whole building at 98 Maiden Lane, and there we conducted the business for five years, until 1878 On our president's return, and on account of the rapid increase of business, we bought a brick factory in Brooklyn, E D, a four-story building one hundred feet square This was used only for bottling and shipping, and for the Business and Advertising Departments of the Pond's Extract Company Our distilleries were still in Chester Connecticut

"When the bridge crossing East River was built the site of our building in Brooklyn was needed, and F W Hurtt bought the old Belmont home, 76 Fifth Avenue, New York, and No 1, West 13th Street This we remodeled moving into it in 1883 As stated, we were then manu-

¹ For years I made distilled hamamelis from a grove of witch hazel shrubs on the Licking River, Kentucky J U L

² The original "extract" abandoned J U L

facturing our Extract at Chester, Connecticut There we abandoned the old kettle previously employed, changing to 400 gallon copper stills made under my own supervision I understand that the same stills are in use by the Pond Extract Company, at the present time With our new stills, I added about twenty-two and one half per cent to the strength of the extract ¹

"There seems to be only two or three sections of the United States where the true species of Witch Hazel grows, of the quality employed by the Pond Company and the Indian 'Medicine Man' of the Oneidas, namely, Central New York and Connecticut I am told that each year the tribes of Indians on the plains send their Medicine Man East, for their supply of what they term 'Witch Hazel Bush'

"In 1884, our president, F W Hurtt, passed away, and I was elected President of the Company, remaining in that position until I resigned, in 1898 At that time our business was about half a million dollars each year

"In 1882 I added several new preparations, consisting of toilet cream, dentifrice, lip salve, ointment, porous plasters, catarrh remedy and toilet soap Special machinery for their manufacture was erected in our laboratory at Number 1 West 13th Street, that building being connected with the one containing our offices at 76 Fifth Avenue All the articles above mentioned were made from the product of Pond's Extract, in different forms, and proved very successful with a large trade

"In 1878 we had opened a branch on Great Russell Street, London, opposite Bridges Museum, and there built up a reasonable trade, principally on Pond's Extract We also established an agency with Roberts and Co, of Paris, France We exhibited our preparations at the Paris Exposition, and received a medal The date of that Exposition I have forgotten,² and have no data by which I can recall it I think the present Pond's Extract Company retains the London Branch, at the present day ³

'While in London, I made a contract with the Hotel Syndicate that controlled all the first class hotels in London The contract was as follows The Syndicate to buy from the London Company ten gross of Pond's Extract, of the small size, and pay our regular wholesale price for it They were to place a bottle in each guest's room, charging same to the room When occupied by a guest, it was the duty of the chambermaid to report to the office whether or not the guest had used the bottle If so, it was charged to the guest, and another bottle immediately put in its place We were to place in the 'lifts' of each hotel a large mirror with the words 'Pond's Extract' lettered across its top Other mirrors were to be placed in the reception room and the public rooms on the first floor This would have required an expenditure of ten or eleven thousand dollars For this privilege, for one year, we were to pay the Hotel Syndicate One Thousand Dollars However the Board of Directors of my company refused to sanction my agreement and the contract was not consummated"

FURTHERING PHARMACEUTICAL PUBLICITY * THROUGH THE OPEN OR PARTIALLY OPEN PRESCRIPTION DEPARTMENT

BY W BRUCE PHILIP

In many drug stores the prescription department is tucked away It is out of sight of the customer of the drug store for whom prescriptions are compounded It is a hole into which his prescription disappears as a piece of paper, and presto, comes back from, as a filled bottle, or pill box To the average customer the technique that it goes through is analogous to the one of putting a ten dollar bill into one of

¹ Just what Mr Hurtt meant by the term "Extract," I did not learn J U L

² Probably 1889

³ 1915

* Section on Commercial Interests, A PH A, Washington meeting, 1935

the air cash boxes in a department store, and having it come back turned into silver dollars, nickels and dimes

The only way that pharmacists are going to convince the public that real manipulation and studied procedure, which require skill, is used in compounding prescriptions is to show the processes. The prescription counter that is seen will be interesting and educating.

Personally, I take a decided stand in advocating the partially open prescription department, regardless of the fact that there are a large number of "one man drug stores" in which the pharmacist is often placed at a disadvantage when he is called away from compounding a prescription in order to serve a customer. If he were working at an open prescription department the fact would, of course, become obvious to anyone in the store, that he had left his work at the prescription counter, to wait upon an incoming customer. The interruption of work for the prescription would be noticeable, but why hide it? I do think, however, that pharmacy must do something to keep its professional rating, and that something must be done at once.

In contacting members of Congress, and other legislators, my experience has been that lawmakers are more and more inclined to classify retail drug stores under the category of "merchandising establishments." Legislators in general are reticent, they are not at all willing to enact additional restrictive legislation which is related to laws dealing with professional pharmacy, they hesitate to even consider giving druggists the right of the exclusive sale of drugs.

To open up the prescription departments, or to give the public a glimpse of this part of the store work, will help to stimulate in the public mind the knowledge that the pharmacist is more than just a merchant. *He is a professional man*, but is not thought of as such.

The processes of filtration, percolation and the manufacturing of certain pharmaceuticals may well be displayed with advantage.

In my opinion, the seeing of the actual filling of prescriptions will have a psychological effect upon both the public and the physician.

We should disregard the fallacy that more prescriptions cannot be written than are now being written, because if the public had full confidence in the ability of pharmacists as professional men, or if there was a trust in the retail drug store the public would demand, and the physician would write more prescriptions.

It is the belief of the writer that the open prescription counter would curtail the dispensing of prescriptions by physicians who make a habit of such a practice. I might even add, that people who now buy patent and proprietary medicines might be interested by seeing the art of pharmacy practiced in a drug store, to induce physicians to write prescriptions for pharmacists to compound. Illegible prescriptions or those for other reasons which require study can be read without attracting the patient's attention. There seems to be no logical reason why a part of the prescription department should not be kept out of view of customers, permitting a certain amount of privacy to the pharmacist who is working out a dispensing problem.

One phase of the case is that there are some untidy prescription departments which the dispenser would be ashamed to have the public see. All right, if a partially open prescription department will clean up for druggists who are careless

dispensers and manufacturers the sooner a partially open prescription department is installed the better it will be for every one concerned and interested in pharmacy

The writer recommends that a glass partition be so arranged that conversation in the drug store proper cannot be distinctly heard in the prescription department. In like manner the glass would prevent the carrying of voices in conversation from the prescription counter to customers in the store.

In the final analysis, pharmacy is a profession, and pharmacists should act accordingly. Shall the professional part of the drug store, the prescription department, be limited to a number of professional stores, or to hospitals? No! The plan does not appeal to the writer and it is not the public's idea of good *drug store service*. The public wants and needs *drug stores*.

With all facts considered, the drug store is still a drug store, but there is a need to emphasize it. A partial opening of the prescription department to the public's inspection will emphasize the art of the pharmacist, and will give a solid foundation for the demand for legislation in the public interest. There is a virtue and a need to confine the sale of drugs and medicines to qualified registered pharmacists.

ANNUAL MEETING OF THE BOARDS AND COLLEGES OF PHARMACY, N A B P DISTRICT NO 2

The annual meeting of the Boards and Colleges of Pharmacy, N A B P, District No 2, was held in the American Institute of Pharmacy, March 11th and 12th. The meeting was representative of these bodies and a dinner was given on March 11th to the visiting delegates of the Boards and Colleges under the auspices of the District of Columbia Veteran Druggists' Association, assisted by the D of C Pharmaceutical Association, D of C Board of Pharmacy, the George Washington University School of Pharmacy and Howard University College of Pharmacy.

Dean C. Leonard O'Connell was chairman for the Colleges and John M. Woodside for the Boards. Reports of the various standing committees were received and discussed. Among the reports were those on examination technique and statistics. Other reports dealt with phases of examinations and experience requirements and on the fate of the pharmacist under socialized medicine.

Other meetings recently held in the American Institute of Pharmacy were those of the Medical Round Table Association and the Chemists' Club.

THE TWELFTH INTERNATIONAL PHARMACEUTICAL CONGRESS

Among the subjects that will be considered at the Twelfth International Congress in Brussels are the following: The medico-pharmaceutical scope, the limitation of pharmacies, pharmaceutical regulations—control of patent medicines and prices to be charged, management of pharmacies, pharmaceutical service in social insurance, the question of employment in pharmacies, pharmaceutical terms.

AMENDMENT PERMITS RETAIL DRUG CODE AUTHORITY TO INCORPORATE

The National Industrial Recovery Board on March 20th announced approval of an amendment to the code for the retail trade, permitting the code authority for the retail drug trade to incorporate. The amendment applies to the national code authority and to each local committee.

Written assent of the National Industrial Recovery Board must be obtained before any such code authority may incorporate.

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS
DEPARTMENT

The following short paper by Dean Spease presented in his characteristic way contains food for thought by all those who are called upon to teach pharmaceutical arithmetic. As one who has had considerable experience in teaching this subject, I want to say that I am indeed happy that the forthcoming Pharmacopœia will eliminate the difficulties we have had in the past in teaching the subject of "percentage solutions"—C B JORDAN, *Editor*

SOME OBSERVATIONS AFTER TWENTY-FIVE YEARS' EXPERIENCE IN TEACHING PHARMACEUTICAL MATHEMATICS

BY EDWARD SPEASE *

(CONFERENCE OF TEACHERS OF PHARMACY)

I have been asked to say a few words upon my observations of twenty-five years in the teaching of Pharmaceutical Mathematics

This paper will be short even though I might make many observations and it will only be necessary to point out one or two things that are of interest

Back in the days of the two-year course before students were high school graduates I always found it necessary to drill each class over and over again upon the tables of weights and measures before they were ready to begin any form of mathematics. After that they learned methods and principles and what they learned were largely memory feats. To-day this is not true and one lesson upon the metric system, one upon all others, and one upon conversion is sufficient

Of course, there is continued use which furnishes repetition and that clinches the memory part, but to-day they are able to confront themselves with mental pictures and weights and measures mean something real to them though they are not as proficient in the multiplication tables as in olden times. This is explainable. May I add at this point, always show them a grain of wheat and point out the origin of the grain and that it represents 64.8 mg

I read the other day that one of our deans found fault with the high schools. After visiting many high schools I cannot lay the blame at their doors. I find high school graduates to-day lacking in experience. They do not have the experience to draw upon that we older folk have who lived upon farms, in villages or had connections with shops and mechanical devices, if only through our friends. To-day they read of them but don't do them. Riding on a street car or in an auto to school does not furnish that rich background of experience. Shop courses provide much of it but not for all students. This observation also includes the fact that things learned in the grades may never recur until the student reaches us in college and for some, never again. How many of you now know your Latin conjugations and declensions, but review them once more and they will stick.

I enjoy the student of to-day and believe he is easier to teach, and especially since I have visited high schools, read teachers' magazines, talked to high school teachers and learned what they are trying to do

* Dean, Western Reserve University School of Pharmacy, Cleveland, Ohio

The subject of percentage solutions, happily, has been solved by a statement in the British Pharmacopœia and by a similar one to appear in our own next revision. Have you read W/W, W/V and V/V of the British Pharmacopœia?

I have only a few more points to mention. The first is the ever-present difficulty in teaching the student to apply what he knows. He always thinks that percentage or any other matter is different in Pharmacy from what it is elsewhere. This is one point at which the teacher's ingenuity is most taxed.

I should like to recommend to you never to accept an answer, either in whole or in part that cannot be weighed or measured. For instance, one cannot weigh odd fractions, have them expressed in weighable and measurable denominations. Our hospital manufacturing laboratory has done much to help us in this regard.

One principle I always follow is to make all first class room calculations with the utmost accuracy and then, later, give problems and teach when "round numbers" may be used. I tell them an educated person should know when to use judgment, and "round number" factors should not be memorized. I have them calculate the variations in dosage of strychnine in five gallons of a preparation by comparing 19 liters with 18.925 liters as the equivalent of 5 gallons.

Should we all "jump through the same hoop," and is it wise to have all our colleges of pharmacy placing the same emphasis upon all courses offered? We all agree that each college should have individuality. There should, however, be a maximum and minimum beyond which it would not be wise to stray. Several times members of the American Association of Colleges of Pharmacy have studied our college catalogs and offered criticisms. Your Editor believes that as we develop the four-year course there will be less and less reason for criticism. The following study by Dr. Burlage is of great interest and his general comments are worthy of careful consideration. I am sorry that space will not permit the publication of the chart that accompanies Dr. Burlage's paper. The faculty of every college of pharmacy should be interested in this study because it gives an opportunity to determine whether their institution is much out of line in the time devoted to and content of the curriculum.—C. B. JORDAN, *Editor*

A COMPARISON OF THE FOUR-YEAR CURRICULA IN PHARMACEUTICAL SUBJECTS

BY HENRY M. BURLAGE *

Beginning with the academic year 1932-1933, the member colleges of this Association entered upon a new phase of educational endeavor with the elimination of all short courses in Pharmacy by requiring the completion of four years of college training before a degree in Pharmacy might be obtained. As we all know this necessary advancement was attained only after years of struggle and effort on the part of educational leaders in pharmaceutical instruction with the hopes that this profession might be put on a higher plane than it has occupied in the past. The writer feels that such hopes cannot be fully realized unless a critical examination of the individual courses making up the new curricula is resorted to with the purposes of bringing about unification of such courses, the elimination of repetitions and obsolete material and a modernization of the same.

Unfortunately the fourth edition of the Pharmaceutical Syllabus, representing

* Professor of Pharmacy, School of Pharmacy, University of North Carolina

the composite efforts of 21 individuals interested in pharmaceutical affairs and 30 or more teachers recognized in their respective fields, was not released until January 1932 and was, therefore, not available for study in the unification of course instruction

In order to make a critical examination of the courses in so-called Theoretical and Operative Pharmacy which lie offers, the writer decided to study the curricula of the various colleges of the Association to ascertain the position of Pharmacy in these curricula as to time, course content and compare these courses with those outlined in the Syllabus. Accordingly the catalogs for the session 1933-1934 of the member colleges were studied and the results to the best of the author's ability are tabulated in the accompanying table

This study revealed such non-uniformities that it was deemed advisable to present these findings to the Conference of the Teachers of Pharmacy, to show the need of a critical survey of these Pharmacy courses as to content, time, year offered, etc., with the hope that this Conference might make some definite recommendations to the Association in order to bring about a greater uniformity of catalogs, valuations of didactic and laboratory hours, etc

Arithmetic of Pharmacy (Syllabus Requirement (Lectures) 32 + 0 = 32)—Forty-five of 52 curricula offer this subject under the above title or similar titles. There is a probability, however, that this subject matter might be offered in other courses. It is unfortunate that it is necessary for this to be listed in a four-year course. It appears that such a course is necessary since students are so poorly prepared in the fundamentals of arithmetic and algebra that they cannot handle the problems pertaining to pharmacy. The writer feels that the essential work in this subject can be offered without much difficulty in other beginning courses in Pharmacy of a more dignified title. It is pleasing to note that the majority of the schools offer in the Freshman year, only the Syllabus requirement

Dispensing (including Incompatibilities) (Syllabus Requirement (Lectures) 64 + (Laboratory) 128 = 192)—Practically all of the schools offer courses under this heading, a few, however, list Dispensing under Manufacturing Pharmacy, some offering an unusually large number of hours of Dispensing, probably including other course material. A majority of the schools offer the hours suggested by the Syllabus, or more, 19 schools as far as could be ascertained offer less than the Syllabus requirement in hours. It appears that any school offering less than 192 hours is neglecting an important phase of Pharmaceutical education and that even more than this amount might be desirable. This subject has no place in the curriculum before the Junior year, the survey shows that a majority offer it in the Senior year

History of Pharmacy (Syllabus Requirement (Lectures) 32 + 0 = 32)—Twenty-eight schools offer this course, which might be developed to be of great value in raising the professional morale, some, no doubt include the subject matter in other courses. A majority offer 32 hours chiefly in the Freshman year. The proper time to offer this material is subject to discussion

Pharmaceutical Jurisprudence (Syllabus Requirement (Lectures) 32 + 0 = 32)—Thirty-three schools offer this material in courses ranging from 11-96 hours, 14 offer the Syllabus requirement, 20 offer the course in the Senior year. It seems appropriate to offer this course only in the Senior year devoting *not more* than 32 hours, also rather than provide for another course of low credit hours, this material might well be covered in a course in Dispensing or Commercial Pharmacy

Latin of Pharmacy (Syllabus Requirement (Lectures) 32 + 0 = 32)—With many students offering several years of Latin as entrance credit, this subject in the writer's opinion is over-emphasized and the necessary instruction might be introduced in beginning Pharmacy courses and later in Dispensing when the prescription is studied. Hours range from 16-48 with 22 curricula out of 27 offering 32 hours. It seems appropriate to offer this work in the Freshman year and a majority recognize this fact

Manufacturing Pharmacy (Syllabus Requirement—Optional— + (Laboratory) 96 = 96)—Twelve catalogs offer courses under this title with hours varying from 80-192 in the Junior or

Senior years, lecture work is offered in most cases. There seems to be some confusion as to the content of the course. According to the Syllabus, Manufacturing Pharmacy is "quantity production of pharmaceuticals," or production on a semi-commercial scale and does not mean the preparation of pharmaceuticals in small quantities.

Following Manufacturing Pharmacy, the Syllabus lists in order, Operative Pharmacy ((lectures) 64 + (laboratory) 128 = 192), Pharmaceutical Technique (0 + (laboratory) 64 = 64) and Theory of Pharmacy ((lectures) 192 + 0 = 192) totaling 256 + 192 = 448 hours. The subjects are outlined to include subject matter of the greatest basic and fundamental importance in pharmaceutical training and should receive the greatest study and attention of teachers of Pharmacy. These subjects, no doubt, as outlined in the Syllabus, have and will receive criticism as to content, time allotment, etc. It is unfortunate that these sections were not divided more strictly, stating a time requirement for the various subdivisions, thus avoiding a certain amount of confusion that is evident in a study of the curricula of the schools. This condition has made the tabulation of these vital subjects difficult. In order to simplify this task somewhat the following subdivisions of the three subjects of the Syllabus are adhered to: Pharmaceutical Technique, Galenical Pharmacy, Pharmacy of Inorganic Chemicals, Pharmacy of Organic Chemicals (including New and Non official Remedies).

Pharmaceutical Technique—Fifty one schools offer this subject matter under the above or similar titles with hours varying from 32-320, those offering a large number of hours, however also include other subject matter. Thirty four offer the work in the Freshman year, 13 in the Sophomore year, 3 in both years, in most cases lecture work accompanies the laboratory work. It appears that the course in catalogs should be more clearly defined. From the writer's experience, a satisfactory division of hours appears to be ((lectures) 48 + (laboratory) 64 = 112), offered as a Freshman or early Sophomore subject employing in the laboratory work official examples of the processes wherever possible.

Galenical Pharmacy—While many individuals object to this title, the writer feels it to be distinctly pharmaceutical, indicating a phase of the so called Operative Pharmacy involving the classes of the official preparations and their manufacture especially those which do not involve chemical reactions. This phase of the work should be regarded by the teacher of Pharmacy as one of the most important of pharmaceutical training. In no other course can the theories of the basic courses be so applied as to develop technique, professional pride and interest. Under no conditions should it be neglected in organization and time.

Fifty catalogs list courses which are distinctly galenical pharmacy, in some cases, technique, inorganic pharmacy, manufacturing and commercial pharmacy are also included. Clock hours vary extremely from 53-544, the subject matter is offered in the majority of cases in the Sophomore year but the spread extends from the Freshman to the Senior years. It appears that a course of 160 hours ((lectures) 64 + (laboratory) 32 = 96) offered not earlier than the Sophomore or Junior year is satisfactory and desirable.

Pharmacy of Inorganic Chemicals (Inorganic Pharmacy)—A course with one or the other of these titles is subject to much controversy as some individuals feel that this material falls in the realm of so called Inorganic Pharmaceutical Chemistry or that it is adequately covered in basic Chemistry courses. To a certain degree the writer concurs with these opinions. A course seems highly desirable which deals with the official inorganic compounds studying them from the angle of their periodic classification accompanied by laboratory exercises performing the necessary tests and preparing and studying the official preparations involving chemical reactions of these inorganic substances.

Twenty-nine schools offer courses which might be construed to include this course material with a wide variation of hours offered chiefly in the Sophomore and Junior years. A course of 80-96 clock hours ((lectures) 32 + (laboratory) 48 = 80) or ((lectures) 32 + (laboratory) 64 = 96) offered in the Sophomore year seems desirable.

Pharmacy of the Organic Chemicals (Organic Pharmacy)—Such a course is also subject to discussion especially as to course content since it might be included in so called Organic Pharmaceutical Chemistry. The writer does not agree with these contentions especially if the Pharmaceutical Chemistry courses are of a basic nature since the fundamentals of organic chemistry can not be stressed and at the same time a study of the official organic compounds be made, some knowledge of the more complex substances of natural origin and especially the ethical new and

non official remedies which are becoming more and more important should be stressed A course of 48-80 hours ((lectures) $48 + 0 = 48$) to (lectures) $48 +$ (laboratory) $32 = 80$) offered in the Senior year would be especially valuable

Commercial Pharmacy—Thirty-four catalogs listed courses which vary greatly in hours and offered chiefly in the Junior or Senior years such courses are not offered by some schools since the commercial subjects are offered in service departments as Economics and Commerce

GENERAL COMMENTS

1 Of the 54 catalogs studied, 53 offer curricula for the four-year course
2 Eleven of the 54 colleges are on a quarter basis
3 The curricula of 11 schools offer too many courses of small credit evaluation This weakness can in part be corrected by uniting the didactic course with the laboratory course in the same subject, rather than offering two courses This has been an outstanding weakness of Pharmaceutical curricula for years and presents a condition which is open to much criticism by educators A course requiring only one lecture hour a week should be increased in credit value or incorporated with a suitable major subject where it might be treated appropriately

4 Four curricula offer Seminar courses which is of questionable value for under-graduates unless they have unusual ability

5 Five institutions offer Assaying in pharmacy courses This instruction seemingly and more properly should be offered in Quantitative Pharmaceutical Chemistry

6 Considerable variation as to the number of laboratory hours equivalent to 1 credit hour is apparent Nine curricula listed laboratory courses with no credit for this work to 1, 2, 3 and 4 clock hours equivalent to 1 credit hour

7 Three colleges offer courses in the Use of the Library and Literature, such subject matter might well be offered in History of Pharmacy

8 A course entitled Research and Thesis offered by 3 schools is of a commendable type but it appears that it should be offered as an elective only to those undergraduates who possess unusual investigative ability

9 Pharmacy courses are distributed throughout the four years by most of the institutions with the following exceptions one school with no work in the Junior year, two with none in the Senior year, and six with no work in the Freshman year

10 Twenty-three curricula list one or more courses which to all appearances are review courses preparatory to the State Board Examinations Such review seemed advisable when 2- and 3-year curricula were offered but in the new curriculum seems unnecessary with the additional time allowed and if the courses offered are of such a calibre and so distributed as to allow more intensive and thorough study The time consumed by review courses might well be devoted to courses elective for the purpose of broadening the training of the student

11 Curriculum Outlined and Course Descriptions

(a) In 9 catalogs didactic and laboratory hours not stated in whole or part

(b) Eleven offer vague or confusing course descriptions and outlines, 5 of which were difficult to study intelligently

(c) Two outlines of study with no course numbers

(d) One with credits poorly defined

(e) Credits in 2 curricula outlines did not correspond with those in the course description

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council"
—Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association "

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates "

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

BALTIMORE

The February meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Hotel Emerson on Monday, February 18 1935 President Wm F Reindollar presided

The speaker of the evening was Dr J Leon Lascoff¹ of New York City, who discussed methods of compounding difficult prescriptions and gave demonstrations The title of his paper was—'It Can Be Done'—the paper follows

IT CAN BE DONE III

The author stated that this was the third paper of the series, the first was presented at the Baltimore meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION, and the second before the Massachusetts Pharmaceutical Association

The prescriptions discussed in this paper are representative of those received in the 'Lascoff Pharmacy,' some are brought in by pharmacists to be compounded for them, on others advice was asked by phone and otherwise

Requests are received daily from pharmacists asking for advice in dispensing Quite often, the reason for this is due to the fact that the patient has brought in a copy of the prescription from another pharmacy The one who originally compounded the prescription may have dispensed a clear solution or a homogeneous mixture The next dispenser may have produced a cloudy mixture, or one so unsavory that the patient probably felt that he would be benefited more by not taking it than by following the directions on the label

Such differences in results of dispensing often lead physicians to prescribe proprietaries It is not difficult to understand why, the physician is certain, to a degree, that when he prescribes a proprietary that he will obtain a mixture containing equally divided doses, having a pleasant taste, a good color and a uniformity of appearance no matter where it is dispensed

The New York State Pharmaceutical Association has appointed a U S P and N F Propaganda Committee which has sponsored meetings of physicians and pharmacists At these gatherings the physicians have been asked why they did not prescribe U S P and N F preparations more frequently The gist of their complaints was the lack of uniformity in dispensing and the fact that they could not obtain satisfactory preparations of the same medication from different pharmacists

It was pointed out, of course, that if the patient read the prescription, and discovered that the medicine was a proprietary which could be purchased practically anywhere, it was very apt to

¹ Chairman, Committee on Recipe Book

lead to self-medication. Most physicians are willing to prescribe official preparations if they can do so with the assurance that their patients will receive uniform, palatable preparations.

Physicians are visited daily by detail men from the pharmaceutical manufacturing houses. Usually samples of proprietaries and the "Pharmacopœia" of the manufacturer are left with the physicians. The question arises, "Why does not the Pharmacist do his own detail work?" There are many practical methods of doing this, and the results are really worth while.

If all pharmacists belonged to, and supported the state and national pharmaceutical associations, effective propaganda could be carried on, the purpose of which would be to acquaint physicians with the merits of official preparations and the advisability of prescribing them.

Unfortunately, many pharmacists have no desire to develop their prescription practice, they consider it a "necessary evil." They prefer selling some article which merely requires wrapping up, they consider that this type of business is easier to handle, requires less work, involves no responsibility and the profits are greater. But prescription business is worth while, and statistics prove it.

Quoting Dr. Robert L. Swain, in a recent issue of *Drug Topics*:

"Statistics reveal that retail pharmacists compound annually more than 250,000,000 prescriptions. Each of these represents a contribution to the health and physical welfare of the general public. This impressive record establishes the pharmacist as a health officer whose profession is vitally affected by the public interest."

Mind you, 250,000,000 prescriptions are compounded in the course of one year! This figure offers a very obvious answer to the question, "Is prescription business worth while?"

For years the separation of the pharmacy from the drug store has been advocated by the speaker—the professional pharmacy should not be submerged by side lines, and sandwich counters, and it is interesting to note that for the past few years there has been a definite movement toward professionalism in pharmacy. Many pharmacists who had luncheonettes which practically obscured their prescription counters have discarded the lunchrooms and are featuring prescription departments instead.

In the writer's observations of these changes he has noticed three types of Prescription Departments for which improvements might be suggested:

1. The type which is entirely enclosed, which is tucked into a very small space in the pharmacy, and bears a "No Admittance" sign.

2. The type having a partition so high that persons on the outside can see only the ceiling of the prescription room.

3. The type having the entire prescription room open to the view of the public. Everything the pharmacist does is seen by the customer. This is not always advisable.

The writer does not approve of prescription rooms which are too open nor of those which are entirely closed. There should be a happy medium—neither completely closed nor entirely open. The dividing partition between the prescription room and other section of the pharmacy should be high enough for a person to see the head of the pharmacist at work but not his hands. The patient should not see when a label is washed off a bottle or when pills are transferred from an original package to a box, in order to affix directions.

In the average store the size of the Prescription Department should be about one-third that of the entire store. The counters of the department should be made of "white glass." This is very easily kept clean and presents a very attractive appearance to the laity who observe, it also makes a good impression on physicians who are enthusiastic about cleanliness.

Needless to say it is not enough to just install an attractive prescription room, pharmacists cannot stop at this point—they must make their departments pay.

There are many methods which can be used to increase the volume of the prescription business.

Detailing the neighborhood physicians advisable.—Let the physician know that you are equipped to help him solve his prescription problems. Impress him with the idea that you can do something for him. Interest him enough so that he will visit your pharmacy and your prescription department. But be sure that you have something worth showing, so that the physician will not feel that his time has been wasted.

Keep the public advised of the fact that yours is a professional pharmacy. Advertising in

the local papers and journals is an effective method of doing this Well arranged, professional windows usually attract attention and create a lasting impression

In dispensing, use neat boxes, labels and wrapping materials Everything that leaves the pharmacy must be in tip top order Use only those ingredients manufactured by reputable concerns

In the writer's opinion a successful prescription pharmacy cannot be run by one man alone a prescription should be compounded without interruptions This is not possible when one man attempts to take care of both the counter trade and the compounding The pharmacist should be able to carefully read over the prescription noting the doses, and the incompatibilities if any are present Under no circumstances should he be that type of pharmacist who continually abuses the "Shake Label" If he is in doubt about any of the ingredients in a prescription or about the doses he should consult the physician or reference books Those prescriptions which present compounding difficulties should be studied with care Many mixtures from which it is, at first glance, seemingly impossible to make a palatable, homogeneous preparation can be properly made and dispensed with the exercise of due thought and care

The prescriptions which follow are samples of those which have troubled many pharmacists Correct compounding procedures have converted them from disagreeable looking unsatisfactory products, to preparations which are proper and correct for administration as medicine

R ₁	Ichthyol	4 0
	Calamine	8 0
	Zinc Stearate	2 0
	Lime Water q s	120 0

In compounding this prescription, as written, the zinc stearate will float at the top of the mixture Neither acacia nor tragacanth will help in obtaining a smooth mixture The only remedy is to add glycerin to the zinc stearate, rubbing well Add the calamine Add the ichthyol previously dissolved in a small quantity of water Finally add lime water enough to make 120 cc

R ₂	Potassium Iodide	5 I
	Salicylic Acid	5 II
	Sodium Bicarbonate	5 II
	Tincture of Colchicum Seed	5 III
	Aromatic Elixir	
	Compound Syrup of Sarsaparilla of each q s	f 5 III

This prescription does not contain sufficient sodium bicarbonate to neutralize the salicylic acid It is necessary to add 2 drachms of sodium bicarbonate to the salicylic acid with the aromatic elixir When the reaction has taken place, filter out the excess sodium bicarbonate and add the other ingredients The resulting solution is clear without any sediment or precipitation

R ₃	Ammoniated Mercury	2 0
	Acid Salicylic	3 0
	Phenol	0 5
	Alcohol*	15 0
	Soft Soap	10 0
	Rose Water q s	90 0

The pharmacist who presented this prescription complained that after compounding a heavy lumpy precipitate formed which greatly resembled a sponge No matter how he attempted to fill this prescription, he did not get a satisfactory preparation The method used in the preparation shown, was to rub up the ammoniated mercury and the salicylic acid to a very fine uniform powder Add the rose water, triturating well until a smooth paste is formed Add the soft soap and lastly the phenol

* The alcohol was omitted because this seemed to cause all of the trouble

R 4	Zinc Sulphate	gr I
	Boric Acid	gr V
	Sodium Borate	gr IV
	Rose Water q s	fl oz I

This prescription is intended as an eye prescription and if compounded as written will form a zinc borate compound which is insoluble. The addition of Price's Glycerin does not dissolve the precipitate sufficiently to enable it to be used in the eyes. The only other alternative is to filter, which was done.

R 5	Betanaphthol	ʒ I
	Asafetida	ʒ II
	Syrup	fʒ II
	Elixir of Three Bromides q s	fʒ III

The pharmacist telephoned in this difficult prescription and informed us that he had tried making an emulsion using acacia to emulsify the asafetida. He evidently did not remember that there is an official Emulsion of Asafetida, which does not employ acacia or tragacanth. We rubbed up the asafetida to a very fine powder and then adding water very little at a time formed an emulsion. To this add the betanaphthol previously rubbed up with the elixir of three bromides and add the syrup. This mixture was strained through cotton. The result is a homogeneous mixture without any separation.

R 6	Morphine Sulphate	gr II
	Potassium Iodide	gr C
	Tincture of Belladonna	ʒ II
	Peppermint Water q s	fʒ III

When compounded, a precipitation of morphine alkaloid takes place due to the action of the potassium iodide on the alkaloidal salt, morphine sulphate. There is not enough alcohol in the tincture of belladonna to keep the morphine alkaloid in solution, therefore it is necessary to add about three drachms of alcohol, which will dissolve the precipitate.

R 7	Cinnabar	4 0
	Precipitated Sulphur	4 0
	Water q s	120 0

This prescription presented a very messy appearance when compounded as written. The cinnabar stuck to the sides of the bottle and could not be shaken into a uniform mixture. It is not necessary to use acacia or tragacanth. In preparing this prescription, we rubbed up the cinnabar with half an ounce of glycerin and added to this the precipitated sulphur. Finally, the water was added, forming a fine uniform homogeneous mixture without any messy separation.

R 8	Fluidextract of Cannabis	ʒ Iss
	Ammonium Chloride	ʒ III
	Syrup of Hydriodic Acid q s	fʒ IV

The resins of cannabis will be precipitated out by the syrup, therefore, it will be necessary to add an equal amount of acacia to the cannabis. Dissolve the ammonium chloride in about three drachms of water. To this add the syrup of hydriodic acid and add gradually to the fluid-extract of cannabis and acacia. The resulting mixture does not contain any precipitation and is a uniform mixture, suitable for dispensing.

R 9	Lead Acetate	4 5
	Precipitated Sulphur	4 5
	Glycerin	4 5
	Water q s	90 0

In this prescription the sulphur will separate out and a uniform mixture cannot be obtained if compounded as written. It is necessary, therefore, to rub up the sulphur with a drachm of tragacanth, to which glycerin was added. Dissolve the lead acetate in water and add to the sulphur mixture. Finally add enough water to make the ninety cc. This mixture, when shaken, is presentable and can very well be dispensed without fear of the sulphur separation taking place.

R 10 Sodium Borate	9 0
Oil of Gaultheria	3 6
Liniment of Soft Soap <i>q s</i>	120 0

We compounded this prescription as written and noted after a while that there were large pieces of floating borax (presumably). This was also evidenced when the lotion was rubbed on the hand. It was very gritty. To remedy this, we dissolved the sodium borate in a small quantity of hot water and rubbed this up with soft soap. Next we added the oil of gaultheria and the liniment of soft soap, enough to make 120 cc.

R 11 Sodium Bromide	5 III
Ammonium Bromide	5 III
Elix of Iron, Quinine and Strychnine	
Phosphate <i>q s</i>	f 5 III

The elixir is not very stable and is incompatible with a large number of other ingredients. In this prescription it is advisable to use the Elixir of Iron Quinine and Strychnine Citrate. The solution would then be clear without any separation or precipitation.

R 12 Potassium Chlorate	8 0
Tincture of Myrrh	12 0
Distilled Water <i>q s</i>	120 0

This is intended as a gargle but could not be used if compounded as written. There is a separation of the constituents of the tincture of myrrh when added to the water. To overcome this, we rubbed up the tincture of myrrh with one drachm of powdered acacia. Separately we dissolved the potassium chlorate in some water and added to the myrrh and acacia. Finally enough water was added to make the 120 cc. The final mixture is homogeneous without any separation.

R 13 Strontium Bromide	12 0
Ammonium Carbonate	8 0
Syrup of Tolu	30 0
Water <i>q s</i>	90 0

The difficulty in this prescription lies in the fact that the strontium bromide is incompatible with alkalis. Therefore, it is necessary to use ammonium bromide in place of the strontium bromide when a very nice clear solution results.

R 14 Phenobarbital	0 5
Sodium Bromide	4 0
Elixir Pyramidon	45 0
Water <i>q s</i>	60 0

When compounded we noticed a precipitate of fine crystals which probably is the phenobarbital. Instead of using phenobarbital, we used the soluble phenobarbital, namely—Phenobarbital Sodium. We dissolved this together with the sodium bromide in water and added the elixir pyramidon. There is not sufficient alcohol in the elixir to precipitate out the phenobarbital sodium.

R 15 Menthol	0 06
Camphor	0 06
Mercurochrome	0 12
Olive Oil	60 00

The mercurochrome is not soluble in the olive oil, therefore, it is necessary to dissolve the mercurochrome in a few drops of water. Pick up this solution with a small quantity of Aquaphor. To this gradually add the olive oil. In another mortar triturate the menthol and camphor together until they liquefy. Add some of the olive oil to this. Finally, mix both solutions and add enough of the oil to make the two ounces. The resulting mixture does not have any separation of the mercurochrome and is perfectly uniform.

R _j 16	Arsenic Trioxide	0 06
	Extract of Nux Vomica	2 00
	Quinine Sulphate	0 60
	Peppermint Water q s	240 00

None of the powder ingredients are soluble in water, therefore, if compounded as written, the patient may very easily take an overdose. In preparing this prescription, we used 100 minims of the Liquor Acidi Arsenosi which is 1% arsenic trioxide. Also, instead of using the insoluble quinine sulphate, we could use the soluble quinine bisulphate. Dissolve the extract of nux vomica in some diluted alcohol. Add all of the solutions and then add sufficient peppermint water to make 240 cc. You will note, in the finished product, that there is no precipitation and that the solution is perfectly clear.

R _j 17	Camphor	4 00
	Salicylic Acid	0 66
	Precipitated Sulphur	6 50
	Lime Water q s	120 00

When compounding this prescription as written, we noticed a complete separation of the insoluble material. To properly compound this we dissolved the camphor and salicylic acid in a small quantity of alcohol. Rub up the sulphur with about a drachm of tragacanth, adding the lime water. Finally mix the camphor solution to the sulphur and add enough lime water to make 120 cc.

R _j 18	Phenol	1 0
	Tincture of Iodine	1 0
	Mucilage of Acacia	4 0
	Alcohol	20 0

When compounded as written, a stringy precipitate results which is due to the incompatibility of the alcohol with the acacia. Therefore, in order to dispense a presentable solution we can leave out the troublesome mucilage of acacia and the result will be a clear solution.

R _j 19	Iodine	gr I
	Ephedrine Alkaloid	gr V
	Menthol	gr III
	Camphor	gr III
	Liquid Petrolatum q s	f 5 I

When the pharmacist compounded this prescription, he noted that upon the addition of the ephedrine alkaloid, the solution turned a murky brown and after a day, decolorized completely. This was due of course to the action of the alkaloid on the iodine. We compounded this prescription by rubbing up the camphor and menthol until liquid, then added the iodine and a small amount of petrolatum and rubbed until the iodine dissolved. Using ephedrine sulphate instead of the alkaloid we dissolved this in a small quantity of water and picked it up with aid of Aquaphor. To the ephedrine mixture, we added slowly the liquid petrolatum. Next we added the camphor menthol iodine solution. You will note that the finished product has kept its color and odor of iodine.

R _j 20	Bimodide of Mercury		gr Iss
	Tincture of Iodine	} of each	
	Potassium Iodide		5II
	Syrup of Ferrous Iodide		15II
	Aromatic Elixir		15II

R 21	Magnesium Oxide	3II
	Bismuth Subcarbonate	3I
	Sodium Bicarbonate	3III
	Calcium Carbonate	5II
	Water q s	f5IV

This prescription, after standing for a very short time, became very hard and could not be removed from the bottle. When we compounded this, we added to the powders half an ounce of glycerin and this served to keep the powders in sufficient suspension to be dispensed.

CAPSULES

Recently, the manufacturers have been detailing the physicians on capsules, instead of tablets and pills. This is because of the fact that the physicians are not prescribing ready made pills—they prefer to have the pills freshly made.

The manufacturers are selling such items as Iron and Ammonium Citrate capsules, Digitalis capsules, etc. The cost to the pharmacist is a great deal more than if he were to prepare these himself.

It is not too difficult for any pharmacist to prepare any number of quindine capsules.

In connection with quindine, it was called to the writer's attention, the other day, that a physician wrote for "Quinoidine" and the pharmacist dispensed quindine. Evidently the pharmacist did not trouble to look in his reference books to see if there was such an item as "Quinoidine" or he misread it as "Quindine."

R 23	Quinoidine Capsules	gr V
R 24	Quindine Capsules	gr V
	Iron and Ammonium Citrate Capsules	0 5

SUPPOSITORIES

R 25	Chloral Hydrate	gr X
	Make 12 suppositories	

The pharmacist endeavored to prepare these suppositories but found that they melted while he was working.

In conclusion the author expressed the hope that the demonstrations had been of interest, and that some of the suggestions offered may prove of value. He said that to him Pharmacy is not just a business, he found it an interesting, and absorbing profession, as well as a hobby. He expressed his appreciation of the efforts in his behalf and thanked the members.

An informal dinner was given for the guest of honor which was attended by members of the Baltimore Branch.

Prof. E. N. Gathercoal,¹ of Chicago, was present and commented on the paper. A general discussion was entered into regarding the prescriptions considered by the author. A rising vote of thanks was tendered the latter for his excellent paper.

About forty members attended the meeting.

C. JELEFF CARR *Secretary Treasurer*

CHICAGO

The monthly meeting of the Chicago branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held February 19th, at the University of Illinois College of Pharmacy.

The speaker of the evening was E. E. Swanson, of the Eli Lilly Research Laboratories, who discussed "Physiological Testing."

An introduction to the discussion was made by mentioning the purpose and uses of bioassays. Bio assay, or physiological testing is used where the chemistry of the drug is not definitely known and where a reliable basis of standardization is needed. With some of the drugs that are bio assayed there are cases where there are more than one active constituent.

¹ Chairman, Committee on National Formulary

The speaker cited a cardiac stimulant as an example of bio assay. These drugs are assayed on the frog or cat. In large production work accuracy of the tests is accomplished by a definite system of procedure. Digitalis, for example, comes to the manufacturing house in carload lots. The crude drug is assayed biologically and must assay at least 10 per cent above the U. S. P. standards. The crude drug is passed if it is satisfactory. Then the various preparations of the drug are returned for further testing.

Mr. Swanson stated that his tests showed the U. S. P. frog method and Hatcher Cat method to give about the same results, but preferred the frog method inasmuch as the cat method would involve the use of about sixty cats per week in the large laboratories.

Aconite was discussed and it was stated that the physiological test for strength was much more accurate than the chemical test, especially after the preparation of the drug has stood for some time. Hydrogen ion concentration control was mentioned as a means of preventing deterioration.

A discussion of the assay work on ergot, insulin and pituitary extract was made.

Following the discussion lantern slides were shown to demonstrate many of the points that Mr. Swanson had discussed.

LAWRENCE TEMPLETON, *Secretary*

NEW YORK

The February 1935 meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held in the building of the College of Pharmacy, Columbia University, on the evening of February 11th. About sixty members and their guests attended.

President C. W. Ballard was in the chair and called upon the secretary for his report. This was read and accepted.

Chairman R. S. Lehman of the Committee on Education and Legislation presented his report as follows:

National Legislation—The new alcohol regulations are out—druggists may buy alcohol in larger quantities than one gallon according to bulletin No. 170 of the F. A. C. A., dated January 22, 1935. This bulletin defines the Industrial Uses of Alcohol as follows:

Use of Alcohol and other distilled spirits or wine in the manufacture of medicinal, pharmaceutical or antiseptic products including prescriptions compounded by retail druggists, of toilet products, of flavoring extracts, syrups or of food products or of scientific chemical, mechanical or industrial products, provided such products are unfit for beverage use.

Congress has before it 6000 bills, many of them pertaining to the problems of the retail druggists. Among them three food and drug bills, viz: Copeland S. 1944, McCarran S. 580 also Hoge, H. R. 3972. No public hearings have been arranged thus far on any of the measures introduced as substitutes for or amendments to the Federal Food and Drugs Act, as the Committees on Interstate and Foreign Commerce will be busy with a number of other important matters.¹ Senator Copeland is seriously considering the amendment of his own bill as to the multiple seizure provision. If so, revised multiple seizures will be dispensed with in misbranded articles. W. G. Campbell, director of the Food and Drugs Administration favors the Copeland bill as covering all points to the satisfaction of both sides.

Senator Copeland recently introduced a bill, permitting the sale of drugs, medicines and other products for the prevention of conception by doctors and druggists, but prohibiting the advertising of such items.

Congressman Treadway of New York introduced H. R. 1424, calling a 2½% general sales tax. The administration does not support this measure at present, however, if passed it would realize about twenty million dollars on drug store items alone.

The Federal Trade Commission recently recommended the amendment of Section two of the Clayton Act making it unlawful to discriminate between purchasers unfairly or unjustly, in other words forbidding quantity discounts, and allowing the small buyer to purchase goods at the same price as the large distributor. A bill introduced by Sen. Wheeler of Montana, S. 944 covers this. It is favored by the N. A. R. D.

The hearing on the Price Fixing provisions of the NRA Codes was held on January 12, 1935. Eighty speakers were heard. All those representing industries were agreed that selling

¹ Hearings were held March 2nd and 8th.

below cost was one of the worst features of the depression. Chairman Williams of the NRA recommends the extension of the NRA in its present form for one to two years more. President Roosevelt is expected to indicate his desires in that respect to Congress shortly.¹

The N A R D is making propaganda for a National First Aid Week, in which the necessity of knowing first aid methods and having the materials on hand is impressed on the public. How this will work out in larger communities, where hospital facilities are convenient, and where, as in New York, the rendering of first aid by a pharmacist is more or less frowned upon by the medical profession as practicing medicine illegally is a question.

State Legislation—The New York State Board of Pharmacy has issued a bulletin publishing its interpretation of the two Dunkel bills recently passed by the Legislature (1934).

It forbids the sale by non pharmacists of a large number of popular proprietaries. These must be sold in a licensed pharmacy or drug store, by a licensed pharmacist or druggists or under their supervision.

"Group I, eleven items containing acetanilid, acetphenetidine, etc., including various headache powders, effervescent analgesics, etc.

"Group II, twenty nine items containing poisonous ingredients such as strychnine, arsenic, morphine, etc., and would bar a number of cough medicines and pills similar to Iron Quinine and Strychnine, or Alcin, Belladonna and Strychnine, etc.

"Group III, ten items in the so-called Habit Forming Group, such containing Barbituric Acid derivatives, etc.

"Group IV, eighteen items of various proprietaries which contain such potent ingredients as thyroids, ergot, eucophen belladonna, etc.

"The New York State Pharmaceutical Association through its Committee on Legislation is sponsoring a bill in the State Legislature, this session. A Fair Trade Bill (same as the junior Capper Kelly Bill now a law in California). The California law has worked to great satisfaction in California—same is indicated by the graphs recently set up by the *Druggists Circular* in New York showing sales in California at no profit being only 2½ per cent of the total in drug stores, while in New York City they represent nearly 33½ per cent of the total sales.

"An attempt will also be made to amend the Pharmacy Law defining unethical or unprofessional conduct, and to make them cause for revocation of Pharmacists License."

Following Chairman Lehman's report President Ballard called upon Chairman Stieger of the Progress of Pharmacy Committee for his report, it follows:

In the February 1935 No. of *Industrial & Engineering Chemistry*, Dr. Oser of the Food Research Laboratories of New York City criticizes the Interim Revision of Text for U S P Cod Liver Oil.

The critique is concerned chiefly with the new procedures for biological assay, but the author also objects to the definition and the tests for identity and purity, and to the fact that the only ingredients whose addition to Cod Liver Oil is sanctioned are certain flavoring substances and oxidants being excluded. He states that, among the tests for identity and purity, methods are conspicuously lacking for determination of sophistication by addition of highly potent vitamins containing substances such as halibut liver oil or viosterol.

Chairman E. Fullerton Cook replies for the committee, stating that the text is a necessary compromise. He points out that the text applies only to interim revision and that the new Pharmacopœia will appear shortly. In regard to anti oxidants, he states that the committee declines to accept responsibility for permissive use of such substances on which so little information is available, particularly with regard to physiological action, and also defends the procedure of the biological assay. Chairman Cook says, "The committee accepts the compliment implied by Oser in suggesting that it provide methods for the detection of sophistication but is forced to admit that it is not in a better position to supply such a method than is the critic."

The January 1935 issue of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION makes announcement of Interim Revision No. 3, a new Ergot Assay. It will become official and enforceable, May 1, 1935.

M. F. Lauro in *Oil & Soap* (Vol. 11, No. 12 (1934)) discusses adulteration of Olive Oil. He states that 10-20% of other oils can be mixed with olive oil before any change occurs in the

¹ He has reported

constituent limits, which gives evidence of adulteration. In his opinion, present analytical values should be revised.

Caro and Giam in *Zeitschrift für Physiologische Chemie* (1934) found that tissue extracts inhibit oxidation of ascorbic acid (Vitamin C) which is easily oxidized by atmospheric oxygen. Ringer solution and its most important salt constituents in 0.1-M concentration are likewise inhibitory.

Parsons in *Proceedings of the Royal Society of Medicine* (1934) reports that a case of infantile scurvy was cured by the use of ascorbic acid. This is believed to be the first cure so attained.

The outlook for enteric medication looks quite hopeless. According to "A Study of the Emptying Time of the Stomach with Reference to Pills and Tablets" by Bukey and Brew in the December *JOURNAL OF PHARMACEUTICAL SCIENCES*, tablets may remain in the stomach of the same individual (at various times) from one to more than four hours.

Several conclusions were drawn from their studies of enteric coatings:

- 1st, that size and shape of pill, tablet or capsule have no effect on length of time it will remain in the stomach
- 2nd, the same individual does not react uniformly, etc
- 3rd, emptying time may be influenced by diet
- 4th, type of coating does not have any effect, etc

Chairman Lagorio of the Membership Committee had not had sufficient time to begin the work of his committee and was, therefore, unfortunately unable to report.

Two letters from President Robert P. Fischelis were then read in which he thanked the New York Branch and Dr. H. H. Schaefer for the testimonial dinner in his honor on January 29th.

The business part of the meeting being over, President Ballard called upon the guest speaker of the evening, Dr. David Bryce, who spoke on Medicinal Dyes. The address follows:

MEDICINAL DYES

BY DAVID A. BRICE, M.D.

"Most of you, I feel sure, have had considerable experience of a conversational nature with doctors. Perhaps I am not betraying any professional secrets when I say that your experience has probably been largely that of auditors in such conversations. With your permission I shall restrict this address to six medicinal dyes. I feel sure that such technical information may be of direct benefit in your relations with your physician clients and if I may be permitted to do so I should like to digress a moment at this point to illustrate why.

"About fifteen months ago, one of the senior executives of my organization requested me to look into certain fundamental economic aspects of medicine, not only in its relation to commercial companies such as our own, but the inter-relationship between physicians. It is unnecessary to bore you with all the ramifications of that investigation which I pursued for several months at odd times, but there were two illuminating results which I pass on to you as of interest in the present discussion. Among other things, I sent out a questionnaire which was very carefully and intelligently answered by the majority of physicians. When we had compiled the results of this questionnaire, we were somewhat amazed to find that there was a feeling of great antagonism amounting almost to actual hostility, on the part of almost all of the replying physicians toward the retail pharmacist. This was so striking that in my journeyings about the country, I inquired of as many physicians as practicable, and in particular of certain physicians who I knew had answered the questionnaire as to just why they felt as they did. While it would be presumptuous for me to draw final conclusions from any such very brief and narrow investigation nevertheless one cannot help making some deductions or guesses. It appeared to me that the antagonism to which I have referred was due to the feeling by the physician that the retail pharmacist was allowing his interests to become so diversified in the field of commercial retailing to the laity, both of medical and nonmedical supplies that not only did the retail pharmacist fail to act in the best interests of his physician clients, but that his information on technical subjects, upon which physicians rely, was becoming exceedingly thin. Now please do not misunderstand me and consider that I am saying that this is so. I merely suggest that it appeared to me that physicians think it is so which may not be the same thing. Criticism in life is seldom just—it is more frequently

biased and reflective of the critic's state of mind than of the fault of the one criticized. At the risk of seeming discourteous to you I have mentioned this to night because it has appeared to have a bearing on such technical information as I am going to give in this brief address. Should you find it worth while to acquire highly technical, medical and chemical information of this type not only from me but from other medical directors and other persons who happen to be technically informed in special fields, it would appear likely that your required knowledge in such fields must inevitably be of use to your physician clients in their every day contacts with you. Such usefulness must inevitably redound to your own benefit by promoting a greater feeling of cordiality between pharmacist and physician. Perhaps this is far fetched, but at any rate I leave the suggestion with you for you to assay its worth. Now let us return to our subject.

"What are dyes? It is almost impossible to answer this question in such a way that the definition is universally applicable. A famous definition of a dye is that given by one of our Vice Presidents in a Customs Court case many years ago. He said that a dye was a substance having a definite affinity for animal or vegetable fibres and which in expressing that affinity, colored those fibres with the color of the dye. Let me illustrate what he meant. Imagine that I have here a cylinder of coffee and that into that I dip a cotton towel and then remove and dry the towel. It is true that the towel will be stained with the coffee, but coffee is not a dye, for if one inspects carefully the remaining coffee solution it will be seen that the color of that solution has not changed and that the color deposited in the towel is only that amount of color which ordinarily is carried into the fibres by the solution. In other words coffee has expressed no affinity of its yellow color for the cotton fibres. On the other hand, if I had here a cylinder containing a weak solution of Tartrazine Yellow and dipped into that a cotton cloth and removed and dried the cloth, not only would the cloth be stained yellow but the weak solution would have become almost colorless because of the affinity of the yellow color for the fibres which had been immersed therein. Thus you see there is a fundamental distinction between the two processes. The Tartrazine is of course, a dye. Unfortunately however, the definition will not stand up under severe cross examination by opposing counsel in a court of law. One must qualify any definition made. Suffice it to say for our purposes here this evening that a dye is in most cases an organic material containing the benzene nucleus or some ring structure that is colored in aqueous solutions and which color has an affinity for animal and/or vegetable fibres.

"What is a medicinal dye? A medicinal dye is one of the very, very few members of the dye series which by practical experience, and solely by such practical experience not by any theorizing—has been found to be of use in the treatment of human disease. The six medicinal dyes with which we are particularly concerned tonight are as follows: Methylene Blue, Crystal Violet, Neutral Acriflavine, Brilliant Green, Scarlet Red Sulphonate and Medicinal Fuchsin. A little later I shall show you some slides illustrating these dyes, together with slides of practical work which has been done in one of the fields of dye therapy, and at that time it will be easier for me to demonstrate the chemical formulas than to try to describe them now.

"A description of medicinal dyes would certainly be incomplete without some mention of their early history. As in the case of almost every synthetic organic chemical, commercial development and scientific development have proceeded, if not actually hand in hand at least closely associated. One of the first artificial dyestuffs, if not actually the first ever made was Picric Acid or Symmetrical Trinitrophenol, $C_6H_3(OH)(NO_2)_3$, prepared in 1771 by Woulfe from indigo and nitric acid. Nearly a century later a technical method was developed for the separation of picric acid from coal tar. The dye industry has been largely an outgrowth of that discovery, subsequently various colors such as mauve, magenta, rosaniline blue, Hoffmann's violet, aniline black, methyl violet, methyl green, and many others were discovered and commercially manufactured in England and France. At the same time that this dye research was proceeding, scientific research in pure science was likewise being carried forward and Kekule gave the world his epoch making hypothesis as to the structural formula of the benzene nucleus. It is unnecessary for me to burden you with all the steps in the development of the synthetic dyestuff industry, but it is interesting to note that between the years 1890 and 1911, the commercial development of dyes for technical purposes becomes a race not only between rival concerns but between the laboratory and the manufacturing plant. The rivalry was frequently expressed in international terms, but Europe was far ahead of the United States at that time. Great companies such as Badische, Meister, Lucius & Bruning, Griesheim Elektron, and others were constantly producing new and

better dyes or intermediates. The extraordinary capability of the German people for methodical and patient research was peculiarly adapted to the development of dyes. Accordingly Germany had forged far to the front in this industry when the unfortunate outbreak of hostilities in Europe in 1914 forever terminated the ascendancy of Germany in this art. At that time Germany was responsible for more than 75% of the total world production of synthetic dyes, and actually supplied in excess of 90% of all the dyestuffs used in the great textile manufacturing centres of Great Britain. To meet the situation arising from the war, the various foreign governments associated in the prosecution of war against the Central Powers, severally subsidized financially (and aided legally by the seizure of German patents) the formation of dye manufacturing corporations destined eventually to exceed in skill that of the original German manufacturers.

"From a medicinal point of view, the war brought a development of interest in certain of the medical dyes used for the treatment of the enormous number of wounds at the various hostile fronts. From a surgical standpoint this over-interest in medicinal dyes and antiseptics was exceedingly unfortunate. Dyes are the most delicate of chemical weapons against disease, their structure being such that they frequently change in contact with living tissues to so-called leuco dyes. Leuco dyes are colorless. These leuco dyes frequently change into intermediate forms and then back again to the original dye form. This may easily be demonstrated in the laboratory by bubbling hydrogen sulphide through a cylinder containing a dilute solution of methylene blue. The Methylene Blue is rapidly reduced to the leuco form and the solution becomes colorless. If one wishes now to demonstrate that the dye is still present and has not been permanently changed essentially, one may bubble oxygen through the solution or one may add an oxidizing agent like ferric chloride, whereupon the color of the methylene blue will rapidly return. This same oxidation reduction sort of reaction goes on constantly in the body, and is doubtless responsible for some of the medicinal qualities of the dyes. Now materials of such delicate structure are not particularly well adapted to war wounds. The latter are primarily massive injured areas of tissue, deeply contaminated with all kinds of dirt, containing crushed fragments of skin, muscle, tendons and even bone and such wounds become secondarily infected. The most efficient antiseptic for that type of wound is surgical cleaning up or debridement. Following that it frequently is necessary to use chemical materials which dissolve out debris, such as Dakin's Solution.

"Only in cases under very careful hospital conditions would the dyes be particularly applicable. Nevertheless the dyes were widely used during the war and when good results were not obtained, the blame was laid at the door of the dyes rather than the operator employing them.

"The present world dye situation is that there are four important groups competing with each other for world markets. In England there is Imperial Chemical Industries, Ltd., consisting of British Dyestuffs Corporation, Solway, Oliver Wilkins & Co., and other firms. In Germany there is the great combination known as Interessen Gemeinschaft für Farben Industrie, which contains among others, Badische Anilin, Meister Lucius & Brüning, Baeyer, Cassella, Kalle, and Griesheim Elektron. In France, the great unit has been the Kuhlmann group which has collaborated to a certain extent with the Society of Chemical Industry in Switzerland, with Geigy and others. In the United States, a definite amalgamation of all the chemical companies has neither been legally possible nor commercially desirable. Nevertheless, from scientific and research viewpoints, the work of the American dye companies has been greatly aided by the Chemical Foundation of New York. The great dyestuff manufacturers in this country are DuPont, American Cyanamid, Calco, National Aniline, General Dyestuffs, and several other smaller concerns. If any of you wish to pursue this matter further I refer you to the work by Thorpe on 'Synthetic Dyestuffs,' published by Griffin & Co. of London, from whom I have drawn liberally for the above facts.

"If we may have the slides at this point, I think I can illustrate the nature of each of the dyes, and then go on to a brief discussion of them. The first slide shows the structural formula of Methylene Blue. This is one of the oldest and one of the most interesting of the dyes. Doubtless you have read a great deal in the newspapers concerning the use of Methylene Blue in cyanide poisoning, in illuminating gas poisoning, in carbon monoxide poisoning and in various other conditions. Methylene Blue was proposed as an antidote for such intoxications by Mathilda Brooks and J. C. Geiger, independently, in the West. I have a folder about two inches thick on this subject in my files, but it will suffice to say here what while methylene blue is a moderately good antidote for cyanide poisoning, there are apparently better antidotes. The work of Chen,

Rose and Clowes on nitrites and sodium thiosulphate as well as sodium tetrathionate apparently points the way to more efficient antidotes. For any of you interested in looking up that subject, you will find it in the *Proceedings of the Society for Experimental Biology and Medicine*, Volume 31, page 250 year (1933). Since methylene blue apparently forms meth hemoglobin when in contact with hemoglobin, it seemed from the first unlikely that it would be useful in carbon monoxide and similar poisoning. This point was well made by Haggard and Greenberg of Yale (*J A M A*, 100, 2001 (1933)). However, there have been interesting reports by other men, particularly those by Christopherson (*J A M A*, 100, 25, 2008 (1933)) and Steele and Spink (*New England Journal of Medicine*, 208, 1152 (1933)). We have not heard the last of methylene blue and doubtless scientific investigations now in progress will show some interesting uses for it in medicine but at the present time it may in emergency be used as 50 cc of a 1% solution intra-venously for cyanide poisoning and for the ordinary surgical uses. These latter uses are in infected sinuses, in wounds, in injuries and diseases about the mouth, pharynx, gums and accessory sinuses. Methylene blue is locally the mildest although not necessarily the least toxic of the medicinal dyes in common use. It is a mild bacteriostat. It is ordinarily used in solution of 1 to 1000 or may be used in stronger solutions where particularly indicated. Methylene Blue has some use in malaria and the recommended dose is 1 Gm per day by mouth in conjunction with quinine compounds, where it is particularly valued in the treatment of aestivo autumnal malarial fever. There is one interesting use of methylene blue which deserves some mention. It was first recommended by Blaas in France several years ago as of use in tuberculosis of the bladder. Symptoms from this complication of tuberculosis are extremely annoying to the physician and agonizing to the patient. There is constant pain, and a desire to urinate every few minutes. It is very difficult or impossible to relieve this situation short of curing the tuberculosis. Blaas claimed to have found that methylene blue alleviated the symptoms. Greenberg in this country published within the last couple of years on the subject, and has found excellent results with certain types of methylene blue. He feels that certain so called impure varieties produce a great deal of irritation and are very much less efficient than other pure varieties. The dose used is 1 gram three times a day, and it may also be used in a solution of 1 to 500 to 1 to 1000 in the bladder. Five cc of a 1% solution have also been used for instillation into the bladder.

Crystal Violet—You can see the formula and appearance of the material. So-called Gentian Violet is a mixture of several para-rosaniline hydrochlorides. We have particularly sponsored the idea that it would be better to have a dye in this category which is a pure crystalline material and accordingly we have developed and will market the hydrochloride of hexamethylparos-aniline known as Crystal Violet rather than the mixture which has previously been known as Gentian Violet. From a strictly practical point of view there is little clinical difference in the effects of the two. Crystal Violet is of particular interest because it appears to be especially effective against gram positive bacteria. Such bacteria are staphylococci and to a limited extent streptococci also the bacillus of diphtheria.

"Accordingly, where an invasion by such organisms is suspected or feared, Crystal Violet is particularly indicated. It is used in strengths of 1 to 500 or 1 to 1000. Where there are a great many staphylococci in the blood stream, the so called staphylococcic pyaemia, the use of the dye intramuscularly has been recommended. It apparently works in some cases, but I have heard of other cases in which it did not work. There has been an immense amount of interest in the use of Gentian Violet or Crystal Violet in the treatment of severe burns because of the rather startling and originally brilliant work of Aldrich in Boston. I am going to refer to that a little later and show you his own slides.

"Neutral Acriflavine—Acriflavine belongs to the Acridine group of dyes which derive their names from a yellow color. They are chiefly known as Flavines in Europe. The practical usefulness of the group was discovered in 1912 by Ehrlich in the treatment of African trypanosomiasis. Neutral Acriflavine appears to possess marked antiseptic and germicidal properties against some gram-negative and some gram positive organisms. It has the disadvantage that when taken internally, it appears to be the most toxic of the dyes or at least of those in common use medicinally. Small amounts of it, such as a few grams a day will produce severe nausea and vomiting. It is however, widely used in infections of the genito-urinary tract taken by mouth in a dose from $\frac{1}{2}$ grain to $1\frac{1}{2}$ grains three times a day. The urine must be rendered or maintained alkaline. It appears to be effective in the urine against both gram negative bacilli such as

the colon bacillus, and gram positive cocci. It is occasionally used in wounds in a solution of 1 to 1000 and I understand is used in England for burns.

"Acridamine has probably been most widely used throughout the world for the treatment of acute, subacute and chronic urethral gonorrhea. It has not only been used by mouth and intravenously, but has been used in solutions of from 1 to 3000 and from 1 to 4000 for direct irrigation of the urethra. I will not debate with you the advisability of irrigation treatments in gonorrhea in the male, but I think in general it is frowned upon except in very expert hands and where there are particular indications therefor. Of course, in the female, it is an entirely different matter.

"*Scarlet Red Sulphonate*—This material is a complex sodium salt related to beta naphthol. This dye belongs to the group of so called 'azo' dyes which derive their names from this linkage of two nitrogen atoms which I show you here. Both this material and its congener, Scarlet Red Medicinal Biebrich, have a curious effect of stimulating the growth of the epithelial tissues. Apparently this effect does not extend to other tissues such as fibrous tissues. This material also was greatly abused in surgery both during and subsequent to the war. It must be remembered that any such material must be used only in a clean wound. To attempt to stimulate an infected or contaminated wound would not only be dangerous if you could do it, but fortunately in most cases, you cannot do it. Of course, there are certain exceptions to this rule, particularly the very new technique known as seed implantation of epithelial grafts into infected surfaces, but this is merely the exception that proves the rule. Scarlet Red Sulphonate is slightly soluble in water and more so in alcohol, and thus may be put into solutions in strengths of from 1 to 4% to be applied to clean wounds or the clean edges of wounds for the stimulation of repair. Bettman of Portland, Oregon, has devised a new technique in the use of this material in the promotion of the healing of burns and of skin grafts.

"*Brilliant Green*—There is little essential difference in the indications for the use of Crystal Violet and those for the use of Brilliant Green. However, Brilliant Green is probably a less efficient bacteriostat and a more efficient stimulant of wound repair. Otherwise, there is little difference and Brilliant Green is very much less used in surgery than Crystal Violet. There has been some new interest in Brilliant Green because of the work of Professor Senin at Nijni Novgorod in Russia. This gentleman has used it in the treatment of syccosis vulgaris, or so-called 'barber's itch'. Technique of his treatment has been to remove all crust and scale with a 5% salicylic ointment and then to lightly brush the areas with a dry sponge, opening them up and then painting them every day with a 1% alcoholic solution of Brilliant Green and 70% alcohol. The treatment is favorably considered in England.

"*Medicinal Fuchsin*—This too, somewhat like Gentian Violet is a mixture of Rosaniline Hydrochloride. It is said to be a mixture of rosaniline and pararosaniline hydrochlorides and its formula is as you see. You are doubtless familiar with the use of Fuchsin and Carbol Fuchsin as stains for the staining of tuberculosis organisms. I should emphasize here that the medicinal grade of dye is not the grade used for staining in the laboratory, and you should make that distinction to your physician clients if they inquire. Biological stains are standardized according to the methods of the Biological Stain Commission in Washington, and are sold by different firms and subjected to different processes than medicinal dyes. The interest of recent years in Fuchsin has been two fold. First, the interest in its use in athlete's foot, trichophytosis and similar infections. We have recommended particularly a 10% alcoholic solution of basic fuchsin to which has been added 5% aqueous carbolic acid, 1% boric acid and 10% resorcin and 5% acetone. The technique for this may be found in the publication by Tobias (*Journal of the Missouri Medical Assn*, 27, 443 (1930)). The second very interesting use of fuchsin is in connection with burns. This is as yet unpublished and I shall refer to it later in the section on burns.

"I think I have now given you a rough bird's eye view of the six medicinal dyes in common use, their chemical formulas, their physical characteristics, and appearance, and the chief uses at least in outline form. It might be well at this point to advise you of certain contra-indications which apply not absolutely, but in general, to most medicinal dyes. In the first place, they are apparently not well tolerated by the eye. I cannot give you extensive literature basis for this, but I am fairly certain that one should not employ these dyes in the eye. Of course, there may be an exception where it is necessary to use Scarlet Red Sulphonate in connection with grafts on the lid but in general their use in the eye is to be avoided. Then, too, dyes of an amount in excess

of 0.5 Gm should not be injected in solutions into closed cavities such as the pleura, the joints etc. While it is unlikely that $\frac{1}{10}$ Gm of any dye would produce fatal symptoms, nevertheless, a reasonable precaution is not to inject into closed cavities more than $\frac{1}{2}$ Gm of any dye. Finally, dyes should not be used in contaminated, dirty and crushed wounds, until those wounds have been surgically cleaned up and put in shape for irrigation and healing. Further, patients, who have been taking large amounts of dyes internally should not be exposed to direct sunlight in places as the West where the rays of the sun are extremely intense. This probably also holds true for mercury 'sun lamps'.

"And now with your permission, I would like to turn to a subject in which I have been very much interested for about fifteen years. The subject is the treatment of burns involving large areas of the body. You are doubtless familiar with the old time remedy of carron oil which was smeared upon burns with the greatest abandon, without much effect except to break down the skin and superficial tissues and furnish an excellent feeding ground for all the bacteria present plus all the bacteria carried in by the carron oil. Since then there has been a steady effort upon the part of surgeons throughout the United States to correlate their information and statistics upon burns and to derive therefrom sound conclusions which indicate the way in which the treatment of burns should be directed. The oldest theory in this regard is that a specific protein arises as the result of the burn process, and that this split protein exercises a severe depressing effect upon the central nervous system, and upon the cells of the body as a whole, at times inducing ulceration of the gastrointestinal tract, severe shock, prostration, fever, delirium, and in many cases, death. A very logical outgrowth of this theory was the treatment of burns by coagulation of the burned areas. Obviously, if these areas were liberating progressively a toxic protein, coagulation of the area prevented this liberation, and so diminished or entirely eliminated, theoretically, the effects I have enumerated above. This coagulation treatment is now generally known as the tannic acid treatment of burns and was introduced by the late Dr. Davidson at Henry Ford Hospital in Detroit where it is still thought of very favorably. I have not time to night to give you a full consideration of the facts and fallacies in connection with this theory. It is sufficient to say that certain observers in widely scattered communities have reported excellent results from the tannic acid treatment of burns and that in competent hands it appears to be useful. In all probability, the theory of a burn protein producing the toxicity of burns is not completely tenable.

"The second theory of importance in regard to burns was that of dehydration or abstraction of water or tissue fluid. This theory was lent considerable color by the known increased viscosity of the blood following a burn, the severe renal symptoms and various other factors clearly indicating not only an abnormal water exchange in the body following a severe burn, but an emergency need of the body for large additional quantities of fluid. Certain investigators felt confident that this dehydration was not a mere temporary concomitant of extensive burns, but was in fact the principal underlying cause of the extremely serious effects seen in severe burns within 24 to 72 hours after such cases were admitted to hospital wards. Accordingly, it was a logical outgrowth of such theory, that the introduction of large amounts of fluid, either as water, or glucose solution, or saline solution, subcutaneously, intravenously, and even intraperitoneally, was in order. These measures gave extraordinarily good results in the immediate mortality of burns, and to that extent bore out the theory. I might say parenthetically that the above adjuvant measures are now routine in every good hospital regardless of what principal treatment may be used and it is likely that the proponents of this theory merely discovered something that was absolutely true about burns but was not the principal factor.

"The third theory to which I alluded above, recently proposed in Boston, is that the intoxication following severe burns is directly the result of infection. Certain investigators in 1932 conceived the idea that all the serious effects observed after 12 hours in burned patients were due to the toxemia resulting from infection of the burned area. Obvious as this theory might appear on the surface, its proof is not easy. The best proof was as is so frequently the case in surgical conditions, empirical by actual trial and error. Treatment designed solely to eliminate infection in the burned area produced such a surprising result as to lend considerable support to the theory itself. This does not mean that the ordinary surgical precautions of the light tent, heat externally applied, fluids, treatment of shock, etc., should be neglected. However, these workers in Boston have devoted their principal efforts, in addition to these routine surgical efforts, toward the restraint of infection. The original treatment of this kind was to clean up the burned area, treat the

shock, and then place the patient under a so called 'light tent' This is simply a cradle covered with a blanket and containing electric lights which shed an even light and temperature upon the patient who, of course, is unclothed The temperature underneath the cradle is kept regulated to between 88° F and 90° F by constant inspection of the thermometer kept hanging thereon The original treatment for the first eight hours was that the patient was sprayed on the burned area by an ordinary vaporizing spray with a 1% solution of Gentian Violet or as was later used, Crystal Violet This served to form a light, tough eschar to prevent oozing and loss of fluids, to keep the area sterile, and not least important to render the whole area analgesic After a firm eschar had been formed, the area was sprayed every six hours during the day There were various surgical refinements which it is unnecessary for me to go into Suffice it to say that this treatment in competent hands in Boston City Hospital has proved eminently satisfactory not only in the immediate results, but in the eventual results I have seen these patients up and around the ward in light cotton gowns, seated in chairs, eating their meals in an incredibly brief period of time The growth of the tissues beneath the eschar has been rapid and excellent In many cases, skin grafting has either been avoided entirely or reduced to a minimum It must be borne in mind that neither this treatment nor any other treatment can eliminate the eventual plastic surgery, with all its delicacy and refinements, which becomes necessary following very severe burns of any area of the body Since this original treatment in Boston, I have had the privilege of collaborating in some of the subsequent work, and have made certain suggestions and furnished certain material for the improvement of the technique At the present time, we believe that mixtures of dyes, probably Crystal Violet, Acriflavine and Brilliant Green or Fuchsin will be used in place of the original Crystal Violet This is done to hit the various groups of organisms by the method of a shot-gun charge If we may now have the slides which Dr Aldrich has kindly loaned me, I will show some of the results with the original Crystal Violet treatment

"I must compliment you upon your patience in listening to what must have been a rather technical exposition, on a rather technical subject It is a little difficult for one in my position to get together a talk which will be of interest in the rather highly technical field involved in our work

"I trust, however, that I have been able to give you some insight into the interesting possibilities of medicinal dyes and let me assure you that if at any time in the future I can give you additional information, I should be more than pleased to receive your letters and shall do my best to answer them promptly Again, let me thank you for the courtesy you have extended to me this evening by your invitation to address you and express the hope that I may some time attend some of your other meetings as a listener and not as a speaker "

Following the completion of Dr Bryce's address considerable discussion ensued with many questions being asked by members in the audience These were all carefully gone over and Dr Ballard called for a rising vote of thanks to the speaker

RUDOLF O HAUCK, *Secretary*

PHILADELPHIA

The January meeting of the Philadelphia Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held in the Temple University School of Pharmacy, January 8 1935

The minutes of the previous meeting were read and approved and after an announcement concerning the next meeting, President Barol introduced Dr James C Munch as the speaker His topic concerned 'Recent Developments in the Pharmacology of Digitalis'

He began with a history of the drug, stating that Withering did not recognize its effect on the heart This effect is now believed to be a sedative one rather than tonic Of the 150 active principles formerly listed only 6 are now recognized as having definite heart action

Dr Munch said that about 22 drugs have actions similar to digitalis and discussed the specific actions of Strophanthus Squill, Adonis, Apocynum and Convallaria Of these Adonis has the same potency as Digitalis, Apocynum is twice and Convallaria three times as potent

He said that at the present time 58 methods have been devised for the assay of Digitalis, the newest using the snail heart and is found to correspond to the one hour frog method The toad method used in South Africa, and the pigeon method were also mentioned

Dr Munch described work now being done to study the cumulative activity of digitalis

When the therapeutic dose was administered to a group of cats over a 3 day period, a degeneration of the heart muscle was noted

Potency and standardization were discussed and a series of lantern slides used to illustrate parts of the lecture

Before adjournment a general discussion took place regarding such topics as acid and alkali hydrolysis, preservation of finished products, methods for determining rate of deterioration, the new international digitalis powder standard and the preference for chemical or physiological methods of assay

E H MacLAUGHLIN, *Secretary*

THE NRA

Elliott Thurston is of the opinion that no prophet lives who can tell what Congress, more especially the Senate will do, or when it will adjourn, or what will happen to the legislation affecting the codes and eventually the Supreme Court will decide. State codes have also been affected by decisions—in Wisconsin 20 codes were nullified by a sweeping decision of Chief Justice Marvin B. Rosenberry on March 5th.

Whatever may be said, *pro and con* the drug code has functioned well and to these officials much credit is due.

NARCOTIC RAIDS

The Narcotics Bureau has been eminently successful in bringing to court narcotic peddlers and Commissioner H. J. Anslinger is to be congratulated on his success. No class is more deeply interested in legal restriction of the dispensing of narcotics than pharmacists.

A cross section of the misty world of the narcotic peddler and addict is expected by Narcotics Bureau officials to result eventually from the spectacular Nation wide raid.

AN IMPORTANT DECISION

The recent injunction granted to Eli Lilly & Co., in its case against the Sunset Drug Company for violation of the Lilly contract price under the California Fair Trade act is doubly important to retailers in that state and other states which may pass similar acts. This decision indicates that contracts through wholesalers are valid under the act.

CANCER CURE VENDOR ESCAPES PROSECUTION DIES WITH CANCER

A self styled cancer specialist of Hastings, Mich. died of cancer on the eve of his prosecution on charges of violating the Federal Food and Drugs Act. His principal medicine, "Mixer's Cancer and Scrofula Syrup," composed of potassium iodide, senna, licorice, yellow dock root, sarsaparilla, wintergreen, glycerin alcohol and sugar syrup, had for a long time evaded the Federal law, until Food and Drug Inspectors intercepted a shipment to Chicago and based a recent case on it. Even during Mixer's last illness, his office force continued to sell and ship the so-called "cancer cure."

A cyclone damaged the offices of Secretary Walter D. Adams of Texas Pharmaceutical Association. B. G. Edwards, of Forney, Texas, suffered loss by the destruction of his residence and damage to his store. The storm lasted only about a minute however, during that time caused much destruction, some injuries, but no loss of life.

Secretary H. W. Ayres, of the Washington State Pharmaceutical Association for the past ten years has taken a leave of absence until September 1st in an effort to fully recover his health.

Charles E. Turner, former druggist and Mayor of Dallas, has been designated to handle the finances of the Texas Centennial.

RICHBURG HEADS NRA BOARD

Donald R. Richberg has been appointed by President Roosevelt as acting chairman of the seven-men NRA board. The appointment is temporary only until the revised NRA act is passed by Congress, Mr. Richberg will continue his duties as director of the emergency council.

EDITORIAL NOTES

UNITED STATES CIVIL SERVICE EXAMINATIONS

Applications for the positions of chemist, and senior, associate and assistant chemists must be on file with the U S Civil Service Commission at Washington, D C, not later than April 8, 1935

The entrance salaries range from \$2600 00 to \$4600 00 a year, less a 3½ per cent retirement deduction

In each of the grades, separate lists of eligibles will be established in accordance with the specialized qualifications shown by applicants A number of existing vacancies in the Food and Drug Administration, Department of Agriculture in all grades will be filled from these examinations, as well as a vacancy in the grade of assistant chemist in the Dental Alloy Laboratory, National Bureau of Standards, Department of Commerce

Full information may be obtained from the Secretary of the United States Civil Service Board of Examiners at the post office or custom house in any city which has a post-office of the first or the second class, or from the United States Civil Service Commission, Washington, D C

THE TERCENTENARY OF CHEMISTRY

"Dr C A Browne, chief of chemical and technological research of the United States Bureau of Chemistry and Soils, has officially established 1635 as the date of the birth of American chemical work Then John Winthrop, Jr, founded the industries that are now so vital to national defense and form so large a source of national wealth

"At a tercentenary celebration of the American Chemical Society the memory and the vision of this great colonist will be honored when the history of the birth of chemistry in this country, compiled by Dr Browne, will be read"

In 1642, the General Court of Massachusetts passed an order to raise and produce materials for making gunpowder Winthrop planned for the production of salt, glass potash, saltpeter, medicines, alum and other materials

DRUGS FROM AUTOMATIC MACHINES

An amendment to the Food and Drugs Act Bill of Australia provides that no person shall (a) Install any automatic machine for the sale or supply of any drug or medicine, (b) permit any such automatic machine to be installed,

(c) sell or supply any drug or medicine by means of any automatic machine 'Automatic machine' means any machine or mechanical device used or capable of being used for the purpose of selling or supplying goods without the personal manipulation or attention of the seller or supplier or his servant or agent at the time of the sale or supply Among the reasons given for the clause were the following 1 The accessibility of the machines to children and young people 2 The fact that they provide an uncontrolled means of disposing of dangerous drugs 3 The danger of manipulation whereby a noxious drug may be substituted in place of the original packet 4 The fact that the use of the machines leads to the distribution of habit-forming drugs in small quantities, e g, three tablets for a penny and twelve for threepence 5 The difficulty of control under the laws relating to poisons and early closing

A PLAY BASED ON THE LIFE OF SEMMELWEIS

In Vienna a play has been produced with the title "Dr Semmelweis," from the pen of Hans Refisch (See *Journal of the A M A*, February 23, 1935) "The plot was taken from the life of the immortal physician The drama deals with his struggles and the misjudgment of him by his colleagues This drama has been produced only in Vienna, which failed to appreciate Semmelweis, seeing in this benefactor of humanity only a charlatan and driving him away The play as a literary work is not well done, because it consists of long dialogs and tedious scientific disputes Nevertheless the audience liked it The leading literary reviews of western Europe have dealt with it meritoriously" See editorial, *JOURNAL A PH A*, 6, 341 (1917) Also pages 351 and 382 same issue

The press has reported the finding of twelve pieces of broken pottery on the site of ancient Lachish (one of the capitals of the Canaanites) Dr J L Starkey, head of the *Wellcome Archaeological Research Expedition*, who found the potsherds, entrusted the task of deciphering the inscriptions to Prof Torczyner at Hebrew University of Jerusalem According to the latter this is a most remarkable find, a remarkable fact is that they appear to be written in ordinary ink

PERSONAL AND NEWS ITEMS

Dr Charles A Shull, professor of plant physiology at the University of Chicago, lectured before the Graduate College at the University of Iowa, on March 25th on "Radiation and Life"

Francis P Garvan, president of the Chemical Foundation and recipient of the Priestley Medal as "the greatest lay patron of chemistry," is honorary chairman of the New York Committee organizing the 300th anniversary of the Chemical Industries celebration Prof Arthur W Hixson of Columbia University is general chairman Senator Pat Harrison of Mississippi and Representative James W Wadsworth of New York will be among the speakers at a dinner meeting on April 24th

President Coffman's biennial message (University of Minnesota) is entitled "Youth and Tomorrow's Education" a presentation of some of the problems which confront universities The message has been published in booklet form

Howard B Lewis, director of the College of Pharmacy of the University of Michigan and Professor of Physiological Chemistry in the Medical School has been elected a member of the National Board of Medical Examiners of the United States to succeed the late Professor Otto Folin of Harvard

Mary Dahlgreen Robinson—of Saint Davids, Pennsylvania through Charles E McCormick, of Baltimore—has donated two mortars, several old dispensing bottles and a quassia cup—to the American Institute of Pharmacy

Dean R. C Wilson, University of Georgia, has addressed the radio audiences on narcotic legislation and unregulated sale of barbituric acid preparations and certain other sedatives and hypnotics

J D Ashmore, of Greenville has been named president of South Carolina Pharmaceutical Association succeeding L E Bishop, who has removed from the state

Dean A O Mickelsen addressed the members of the North Pacific Dental Alumni Association at their annual meeting which was held at North Pacific College, February 7th-9th His subject was "Prescription Writing by the Dental Profession" Four hundred and seventy alumni members attended

American winners of the Nobel awards will be guests of honor at a dinner in the Waldorf-Astoria, April 9th, celebrating the 101st anniversary of the birth of Alfred B

Nobel, Swedish scientist who created the awards

The Hillebrand award of the Washington branch of the American Chemical Society was presented at the society's annual banquet at the Cosmos Club, March 14th, to Dr F D Rossini of the Bureau of Standards in recognition of fundamental work on the thermochemistry of hydrocarbons and alcohols

Margaret Cousins has written "Purple Cloud," a story of Bernard Courtois, published in the *Southern Pharmaceutical Journal*

Dean D B R. Johnson, College of Pharmacy, University of Oklahoma, is to be honored with a memorial by members of the faculty and friends

Gustav Bachman, former secretary of Minnesota Pharmaceutical Association, was presented by members of the organization with a beautiful pen set The presentation was an interesting part of the program of the annual session of the Association

OBITUARY

EZRA J KENNEDY

Ezra Joseph Kennedy, member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1887, died of heart disease, February 20th at his home in Rutherford, N J, aged seventy five years

Mr Kennedy was born in Attica, Ohio, where he received his earlier education, in 1882, he was graduated from the pharmacy department of the University of Michigan While engaged in retail pharmacy in and near Detroit, he taught pharmacy at the Detroit College of Pharmacy Later he became associated with the *Pharmaceutical Era*, and when the publication came to New York, Mr Kennedy took up his residence in New Jersey He remained with the *Pharmaceutical Era* for more than forty years, until his retirement several years ago

Surviving are four daughters, Mrs E A Dougherty, Mrs Herbert Bond and Mrs W G Macomber, of Rutherford, and Mrs Ralph W Boyd, of Drumright, Okla, and two sons Ezra J Kennedy, of Rutherford and Fred H Kennedy, of Cleveland

SOCIETIES AND COLLEGES

COMMITTEES FOR A PH A MEETING

Dean A O Mickelson, of the North Pacific College of Pharmacy has been named Local Secretary

The following committees have been named by Harvey J Donnell, secretary of the North Pacific branch of the A Ph A

Convention L F Haack *Chairman*, Frederick Grill, *Secretary*, F A Geue, *Treasurer*, F C Felter Frank Nau, Edgar Stipe, Earl Gunther, all of Portland

Entertainment H J Frank *Chairman*, Peyton Hawes, M C Kaegi, all of Portland

Reception Dean Adolph Ziefle, Corvallis, Ore

Women's Auxiliary Mrs Ralph A Watson, *Chairman*

Representatives named in the various Northwest states, include

Oregon George W Steelhammer, Silverton, Ernst T Stuhr, Corvallis, George C Blakeley, The Dalles, and Roy A Perry, Portland

Washington Dean C W Johnson, Seattle, P H Dirstine, Pullman, L D Bracken, Charles G Ajax, Seattle.

California K B Bowerman San Francisco, Frank E Mortenson Los Angeles, T D Perkins, San Diego

Idaho E O Leonard Pocatello, Charles Carter, Moscow, R M Curst, Standpoint

Montana C E Mollet, Missoula, Emil Starz, Helena, J L Kracker, Bozeman

MEETING OF THE PLANT SCIENCE SEMINAR

The 13th Annual Meeting of the Plant Science Seminar will be held in Portland Oregon, time to be fixed according to a recent announcement by President Frank H Eby

For the first time in the history of the Seminar, the Annual Meeting will be held on the Pacific coast and a large attendance is anticipated Professor E T Stuhr of the Oregon State Agricultural College has been appointed local secretary He has not announced a program but information will appear in the JOURNAL as soon as announcements are made

All persons interested in drug plants are urged to attend the 1935 Seminar Complete information may be obtained by directing communications to the secretary of the Seminar,

F J Bacon, Western Reserve University, Cleveland

DRUGGISTS' BUSINESS CONFERENCE AT PURDUE

March 13th and 14th were important dates for retail druggists in Indiana The fifth annual Druggists' Business Conference was held in the Memorial Union Building on the campus of Purdue University During these two days, problems of vital importance to druggists were discussed

This conference is arranged for druggists and their clerks, and is sponsored by the Pharmacy Extension Department The Indiana Pharmaceutical Association took an important part on the program, and discussed recent legislation as it pertains to the druggist President R P Fischelis, of the A Ph A was an honored guest speaker

A "one act play" was given March 13th, at 8 00 P M, following the dinner and evening address at 6 30 P M The occasion honored Dean C B Jordan upon the completion of twenty-five years of distinctive service as dean of Purdue University School of Pharmacy

BI-CENTENNIAL OF THE ACADEMY OF MEDICINE, MADRID

The Academia Nacional de Medicina of Madrid celebrated recently its second centennial The festivities included several meetings during the medical week and an exhibition of the books of the library which has, among other books of great importance, the Codex scientiae medicinae of Avicenna, in five large volumes and a collection of books written by Hipolito Ruix on American plants, which for more than three centuries were a source of information for botanists and designers from all over the world

IOWA

The annual election of officers of Iowa Pharmaceutical Association resulted as follows *Honorary President*, J F Shuey, Jefferson, *President*, W H McClelland, Corning, *First Vice-President*, R J Allen, Sioux City, *Second Vice-President*, A E Thomas, Des Moines, *Third Vice President*, George McShane, Waterloo, *Treasurer*, J M Lindly, Winfield

Members of the Legislative Committee George Judisch, Ames, George W Gillman, Ft Dodge, T H Knefick, Eagle Grove, J J Gillespie, Des Moines, W F Meads, Des Moines

Among the visitors were Secretary John W Dargavel, of the N A R D, Guy Butler, Lincoln, president of the Nebraska association, J G McBride, secretary of the Nebraska association, Otto A Kuether, Herington, president of the Kansas association, W M Newmark, Topcka, secretary of the Kansas association, W H Varnum, Lawrence treasurer of the Kansas association and secretary of the Midwest Conference, Coleman Dais, Seminole, president of the Oklahoma association, A Roy F Johnson and F G Kustermann of the Minnesota association, J P Jelinek, president of the Northwest Pharmaceutical Bureau and J R Bruce and Frank M McCabe of *North Western Drug-gist*

F W Fitch, Des Moines, has completed an analysis of the price stabilization situation within the drug industry and with the assistance of his attorneys has worked out a plan which he believes is both simple and practical

The plan is based on the filing and registration with each secretary of state the manufacturer's trade mark and resale price. Briefly, this means that in each state the manufacturer would file his trade mark and resale price under a law making it a violation for anyone to sell trade marked merchandise at any other price than that filed with the Secretary of State

According to the proposer's belief the plan is advantageous to the manufacturer in that it would mean just one operation in each state instead of contracting with several thousand druggists in each state. He contends it should be easy of enforcement because it is a state statute, instead of a violation of a contract between individuals

NORTHWEST PHARMACEUTICAL BUREAU

At the annual conference dinner of the Northwest Pharmaceutical Bureau in Des Moines February 20th, President John P Jelinek of St Paul stated that the organization through its annual Great Northwest Drug Show had turned into the Northwest association treasuries almost \$40,000 00 during its years of existence

The following officers were elected *President*, James J Gillespie, Des Moines, *Vice President*, Fred G Kustermann, St Paul, *Treasurer*, Robert M Gibson, Des Moines, *Secretary*, N Vere Sanders, Albert Lea, *Executive Committeemen* Otto A Bjornstad Spencer, Ia, John P Jelinek, St Paul, Minn, Edward J Boherg, Eau Claire, Wis, Homer L Hill, Towner, No Dak, Fred L Vilas, Pierre, So Dak, *Committeeman at large*, E L Beezley, Cedar Rapids, Ia

NORTH DAKOTA

The fiftieth annual convention of the North Dakota Pharmaceutical Association will be held in Fargo, June 11th, 12th and 13th

WISCONSIN

Ralph W Clark reports that the first mid winter conference, held by the Wisconsin Pharmaceutical Association, February 27th was well attended and conceded by all to be a great success. Over three hundred druggists came to this business session fully realizing the seriousness of the present times as far as independent merchants are concerned. They showed their willingness to follow the able guidance of their officers and legal counsel and most certainly will cooperate with them throughout the present legislative session

Attorney Mount, Milwaukee counsel for the Wisconsin Pharmaceutical Association, explained the proposed legislation, the Wisconsin Fair Trade Practices Act which has been introduced into the Assembly. This legislative body arranged an informal committee hearing on the bill which was attended by the druggists and others representing independent merchants' organizations

MINNESOTA

Conforming to the usual program a session of Minnesota Pharmaceutical Association was devoted to the Scientific and Practical Section under the chairmanship of Dean Frederick J Wulling. Among the many papers presented were "Plants and Their Relation to Man," by Gustav J DeMars, "The Open Prescription Department," by President Theodore A Arneson, "British Pharmaceutical Codex," by F A Upsher Smith, "The Operation of a Hospital Pharmacy" by Sister St George and a most comprehensive and interesting report by the retiring secretary, Gustav Bachman. The section included, also, many other interesting papers of scientific importance

Although illness depleted the official ranks of the Minnesota State Pharmaceutical Association during the organization's convention in St Paul the week of February 26th, the meeting was highly successful from every viewpoint, ushering in a second half century of service to its members with renewed enthusiasm and determination

MINNESOTA NOMINEES

The following are nominees for the Minnesota association offices—to be voted upon by mail—ballots to be transmitted to members

by mail *President*, R G Paulson, Fairmont, Wilford J Schwankl, Sauk Rapids *First Vice-President*, Jesse B Slocumb, St Paul, William Shepard, Minneapolis *Second Vice President*, Orlando Didra, Waseca, Margaret Armitage, Princeton *Thrd Vice-President* L M Herbert, Worthington, Guy Hovland Dawson *Secretary*, A Roy F Johnson, Minneapolis, Harry J Anderson, North Branch *Treasurer*, C T Heller Jr, St Paul, B J Witte, Jr, Anoka *Executive Committee* Joseph Vadheim, Tyler, H O Tiegen, Moorhead

LEGAL AND LEGISLATIVE.

PROFESSIONAL EMPLOYEES

Professional persons in the retail trade working unlimited hours are entitled to the same minimum wage classifications as executives working beyond code hours under an amendment to Article V, Section 4 (a) of the retail trade code, approved by the National Industrial Recovery Board, it was announced January 3rd

Article V, Section 4 (c) of the code provides that executives who work unlimited hours must receive minimum wages ranging from \$25 00 to \$35 00 a week, according to population of the communities in which a retail establishment is located

The term "professional person" is defined in the code. It includes, but without limitation, such employees as doctors, dentists, nurses, architects, training directors, artists, research technicians, statisticians, mechanical engineers, etc

CODE AUTHORITIES GRANTED EXEMPTION FROM INCOME TAX

Under a ruling of the Commissioner of Internal Revenue announced March 13, code authorities are entitled to exemption from Federal Income taxes and from filing returns therefor

They are required, however, to file with the Collector of Internal Revenue in their district an affidavit in the form required by Article 101-1 of Regulation 86 of the Bureau of Internal Revenue, setting forth the character of the organization, the purpose for which organized, its activities, the sources and disposition of its income, whether any of its income is credited to surplus or may inure to the benefit of any private individual and all other general facts

relating to its operations which bear upon its right to exemption as a non profit entity

The exemption does not extend to members or employees of code authorities as individuals

POSTPONE EFFECTIVE DATE OF ORDER RESTORING SALES OF TOILET SOAP TO RETAIL CODE JURISDICTION

The National Industrial Recovery Board on March 12th, announced that the effective date of the order making sales of toilet soap again subject to the retail drug code loss limitation provision has been extended to April 5, 1935

Sales of toilet soap were placed under a loss limitation provision similar to that of the retail food and grocery trade code (cost plus 6 per cent), but an order approved February 19th, effective in 21 days, was issued to restore such sales to the retail drug trade code provision. Considerable confusion has arisen, however, and it has been deemed advisable to prepare an order suspending the loss limitation provision of the retail drug code in so far as toilet soap sales are concerned

In order to permit a decision on such an order, the effective date of the February 19th order has been extended to April 5th

SALES TAX

Texas and Kansas oppose a sales tax. New York, Michigan, Colorado, West Virginia, South Dakota, Washington, California, Wyoming, Montana, Maine and Connecticut have sales tax provisions. Arkansas, Tennessee, Massachusetts, New Jersey, Indiana, Wisconsin are considering measures. The West Virginia law expires July 1st, but the Governor has been asked to extend the time. (Texas is now considering a sales tax)

HEARINGS ON THE COPELAND BILL

Hearings were held on the Copeland Bill S 5 (Committee Print No 3) March 2nd and 8th, before members of the Sub Committee of the Committee on Commerce of the Senate of the United States Senator Clark of Missouri, *Chairman*

Representatives of interested associations and organizations attended and about seventy witnesses were scheduled for the hearings. There was some heated discussion and differences of opinion obtained evidencing deep interest—it proves what Dr Carl L Alsberg stated several years ago that "In appraising legislation intended to protect public health or prevent fraud, it is not enough to inquire whether the abuses aimed at are likely to be cured. Political and social consequences need to be envisaged also."

No effort is made to submit opinions on what the Food and Drugs Act should be nor analyze the testimony given. The committee heard many views and, perhaps, enough for reaching conclusions as to what form the presentation in Congress should take. When the measure comes up for action there will, probably, not be unanimity but compromise on some of the stronger contentions. There are some differences of opinion among those to whom the law applies and also among those who frame it and enact the measure.

ARKANSAS

The Arkansas Legislature has passed a bill to prohibit the sale of barbituric acid or derivatives and compounds thereof under any copyrighted or chemical names, except to wholesale drug houses, chemical houses and dispensing pharmacies or practicing physicians, providing that these may not be dispensed except by a practicing physician or retail pharmacy on prescription written by a physician.

IDAHO

Idaho pharmacists are making a determined effort to put pharmacy's affairs again in the hands of pharmacy. A new pharmacy bill (H B 67) takes pharmacy control out of the Department of Law Enforcement under which it has been for many years and puts control in the hands of a state board of pharmacy. This bill passed the house by a vote of 51 to 6 and is said to have the approval of the Governor. This bill will, if passed, create an entirely new set-up for pharmacy in Idaho. It provides that the new board of pharmacy shall be

elected by the state association which will then meet in Boise in June to elect members to the new board and interpret the other provisions of the law for the benefit of Idaho druggists.

MARYLAND

Three bills regulating the drug industry were considered by the Hygiene Committee and referred to the House of Delegates on March 8th.

One measure provides that the United States Pharmacopœia and the National Formulary shall be on file at all times in every pharmacy, that every registered drug store keep a certain minimum of utensils and maintain sanitary standards, that prescription records be filed and that all medicines and drugs be open for inspection at all times wherever they are manufactured or sold.

Another requires that all pharmacies and manufacturers of drugs, medicines, dentifrices, toilet articles and cosmetics shall secure permits from the Maryland Board of Pharmacy.

The third measure would regulate the sale of barbital compounds by making their sale legal only on prescription.

MINNESOTA

A Minnesota bill provides for the regulation of the practice of pharmacy—the sale of drugs, medicines, chemicals, poisons, the establishment of a State board of pharmacy and defining its powers and duties, requirements for registration, licensing pharmacies and pharmacists, etc.

OREGON

The new Oregon pharmacy law is patterned largely after the model pharmacy law sponsored by the National Association of Boards of Pharmacy. It gives more power to the state board in its regulation of pharmacy, provides for registration of all pharmacies with an annual registration fee of \$3 00, provides for elimination, after a few years, of the assistant classification, governs more strictly the sale of poisons and of denatured alcohol, sets up a license for non pharmacy outlets who sell medicinal products, restricts use of such words as "drugs," "druggist," "pharmacy," etc., on signs and in advertising to stores where registered pharmacists are employed, sets new fees for registration by examination or reciprocity and provides certain library and equipment requirements for pharmacies. These are a few of the more important new provisions.

The following abstracts, prepared from articles of pharmaceutical interest appearing in pharmaceutical and other scientific or professional periodicals, are intended to replace the abstracts heretofore published in the annual report of the Reporter on the Progress of Pharmacy and carried in the YEAR BOOK. This work is a new venture on the part of the ASSOCIATION and is still in the formative period. We do not as yet receive all of the journals that we desire to abstract, nor do we have a full staff of abstractors. We expect, however, to make up these deficiencies as time goes on to the end that all periodicals of pharmaceutical importance may be brought within the scope of this work.

The pages carrying these abstracts are numbered beginning with 1 the purpose being to permit those who desire to do so to bind them with the ASSOCIATION data and membership rolls which will be printed later, and thus continue the present series of YEAR BOOKS.

A G DuMEZ

March 12, 1935

BACTERIOLOGY

Bacteria—Growth of, in Organic Acid Media The author, using *B. pyocyaneus*, *B. Aertrycke*, *B. paratyphosus* B and *B. bronchosepticus*, finds with the acids used that in general unsubstituted organic acids of odd numbers of carbon atoms do not support bacterial growth and those of even numbers do, while the hydroxy and amino acids of even numbers of carbon atoms do not support bacterial growth and those of odd numbers do —W F BRUCE *J Am Chem Soc*, 57 (1935), 382 (E B S)

Cholera—Treatment of, with New Anti-cholera Serum A toxin prepared from an 18 hour broth culture by filtration, was injected into horses in doses up to 500 cc. The purified concentrated serum obtained after the immunization process had a titer of 1 in 12,000 of H agglutinin and 1 in 1600 of O agglutinin. Intraperitoneal administration was found to be more effective than subcutaneous or intravenous injection. The latter part of the experiments was carried out using 30–40 cc. of serum diluted with 200 cc. of saline, injections being made intraperitoneally. The following results were obtained. In 211 control cases and 128 cases treated with serum the per cent of deaths was 34.1 and 20.2, respectively. With 57 control cases and 32 cases treated with 30–40 cc. of serum the deaths were 26.3 per cent and 12.5 per cent, respectively. The work will be continued —H GHOSH *Brit Med J*, 1 (1935), 56 (S W G)

Disinfectants—Laboratory Testing of The conditions governing disinfectant action include the concentration of the disinfectant, the time of application, the temperature, the number of bacteria, the nature of bacteria and the presence of other materials with which the disinfectant may act. In the Chick Martin test the author recommends the use of a suspension of yeast to supply the organic matter necessary. The author suggests that the different types of surgical disinfectants may be classified in groups, and each group should have its particular standard. Determination of the toxicity of disinfectants may be made by subcutaneous, oral or intravenous routes. The author suggests that the route should be standardized —L P GARROD *Brit Med J*, 1 (1935), 5 (S W G)

Disinfecting Agent—Hints for Use of The article includes a table of some chemical disinfectants and the strengths in which they should be used for certain purposes. Some other disinfectants are also discussed as to their effectiveness and use. The use of metal tanks of a type illustrated in the article is suggested for the disinfection with an inflammable material of rooms which cannot be completely closed. Disinfection after cases of certain special diseases is then taken up —THOMANN *Schweiz Apoth-Ztg*, 73 (1935), 54 (M F W D)

Gonococcus Filtrate (Corbus-Ferry)—Experience with in Treatment of Gonorrhea Evidence based on the use of Gonococcus Filtrate (Corbus Ferry) intradermally in 124 cases of gonorrhea shows this antigen to be of definite value both in the diagnosis and treatment of this disease. Impressively satisfactory results were obtained with the antigen alone and also when used in conjunction with the usual therapy —R D CUMMING and R A BURHANS *J Am Med Assoc*, 104 (1935), 181 (M R T)

Pneumococci—Use of Sodium Desoxycholate for Identification of Two drops of a 10% water solution of sodium desoxycholate are added to 1 cc. of pneumococcus culture. The culture becomes perfectly clear in from 2 to 5 minutes. The pH of the culture to be tested must not be below 6.5 or the desoxycholate will precipitate. The test is carried out at a temperature below 50° C. The author states that he has never found any streptococci which would dissolve, or any pneumococci which failed to dissolve, in the sodium desoxycholate solution —E LERFSON *J Am Med Assoc*, 104 (1935), 213 (M R T)

Pneumococcus—Oral Immunization of Human Beings against A report on antibody formation following the oral administration of pneumococcus vaccines. Original reference given —V ROSS *Clin Med & Surg*, 42 (1935), 92 (B S R)

BOTANY

Rhubarbs—Investigations on Cultivated The rhizomes of *Rheum officinale* and of *R. palmatum*, cultivated for 2 years at Pavia, contain 1 per cent of anthraquinone derivatives, which is appreciably lower than is found in rhizomes of Asiatic origin. It has been observed that the roots are higher in anthraquinone derivatives than the rhizomes. Cultivation of the most highly prized rhubarbs does not, therefore, seem to produce in the rhizomes the chemical characteristics inherent to those of Asiatic rhubarbs, to which are generally attributed the therapeutic activity.

of rhubarb, and hence the preference shown in the pharmacopœia for the Asiatic product is justified —P MARANGONI *Scienza farm*, 2 (1934), 13, *Chimie et industrie*, 32, 1934, 634, through *Chem Abstracts*, 29 (1935), 888

CHEMISTRY

GENERAL AND PHYSICAL

Centrifugal Force—Nomogram for In designating results involving the use of a centrifugal machine, the force as compared with gravity (relative centrifugal force) should be specified rather than the number of revolutions per minute, which affords but slight notion of the centrifugal stress to which the material has been subjected Centrifugal force, C (in dynes), is given by the relation $C = 4\pi^2 n^2 r$, where n is the number of revolutions per second and r is the radius in centimeters C is divided by 980 to obtain the relative centrifugal force, compared with gravity For ready calculation of centrifugal force, a convenient nomogram is given —H SHAPIRO *Ind Eng Chem, Anal Edit*, 7 (1935), 25 (E G V)

Glycol-Water Mixtures—Relation of Vapor Pressure and Boiling Point to the Composition of The glycol water system was investigated from 0 to 100 per cent glycol and up to atmospheric pressure The boiling point pressure relations are given in the form of the Young equation The mixtures obey Raoult's law fairly closely —H M TRIMBLE and W POTTS *Ind Eng Chem*, 27 (1935), 66 (E G V)

INORGANIC

Hydrogen—Heavy A brief review of heavy hydrogen and a comparison of some of its properties with properties of ordinary hydrogen —E B LUDLAM *Pharm J*, 134 (1935), 88 (W B B)

Magnesium Perchlorate ("Anhydron")—Value of, as Drying Agent Anhydrous magnesium perchlorate which may be prepared by heating the hydrated forms to 200–250° C for a few hours, has been found to be as good as phosphorus pentoxide as a drying agent and for absorbing water The perchlorate is easier to handle than phosphorus pentoxide and may be recovered by heating —J G F DRUCE *J Soc Chem Ind* 54 (1935) 54 (S W G)

ORGANIC

Alkaloids

Morphine Series—Reduction Studies in V Dihydro- and Tetrahydro-Pseudocodeine Methyl Ethers A suspension of 5 Gm of pseudocodeine methyl ether hydrochloride in 50 cc of glacial acetic acid, when hydrogenated in the presence of platinum oxide gave 3.7 Gm of dihydropseudocodeine-A-methyl ether, and 0.7 Gm of the tetrahydro compound The alcoholic methoxy group was not eliminated When pseudocodeine methyl ether was reduced with sodium in absolute alcohol, dihydropseudocodeine-C-methyl ether resulted The methiodide of dihydropseudocodeine-A-methyl ether, when degraded with 25 per cent sodium hydroxide gave dihydro ϵ -methylmorphimethine A-methyl ether which on hydrogenation in 7.5 per cent acetic acid with platinum oxide, gave the tetrahydro compound The methiodide of dihydropseudocodeine-C-methyl ether, when treated with the calculated amount of thallous hydroxide, yielded dihydro ϵ -methylmorphimethine C-methyl ether, which on hydrogenation in 10 per cent acetic acid with platinum oxide yielded the hexahydro ϵ -methylmorphimethine methyl ether Analysis and physical properties of the compounds and certain of their derivatives are given —L SMALL and R E LUTZ *J Am Chem Soc*, 57 (1935), 361 (E B S)

Morphine Series—Reduction Studies in VI Hydrogenation of Alpha- and Beta-Isomorphines Alpha-isomorphine was hydrogenated in alcohol with palladium barium sulphate to dihydro- α isomorphine, and this product on methylation with diazomethane gave dihydroisocodeine The compound and certain derivatives were analyzed and identified Beta isomorphine on hydrogenation in ethanol, using platinum oxide catalyst yielded tetrahydro β isomorphine and when hydrogenated in acetic or hydrochloric acid, yielded a mixture of the dihydro and tetrahydro bases These on methylation yielded dihydro- and tetrahydroallopsudocodeine respectively —L SMALL and B F FARIS *J Am Chem Soc* 57 (1935), 364 (E B S)

Essential Oils and Related Products

Achillea Millefolium Linné—Volatile Oil of The following constants were obtained on some oil obtained by steam distillation from a crop grown at the Pharmaceutical Experiment station at the University of Wisconsin. All figures are at 25° C. Specific gravity 0.9066, Refractive Index, 1.4703, Specific Rotation, $[\alpha]_D = -14.11$ —R. L. McMURRAY *Am. J. Pharm.*, 107 (1935), 33 (R. R. F.)

"Cedro" Wood Oil—Brazilian "Cedro" are trees belonging to the N. O. Meliaceae, genus *Cedrela*, the most common species being *C. odorata* L., *C. angustifolia* D. C., *C. montana* Karst., *C. macrocarpa* Ducke, *C. fissilis* Vell., *C. australis* Juss., St. Hil., *C. glaziovii* D. C., their frequency in the virgin forests corresponds to the order in which their scientific names are given here. Roots, chips, sawdust, leaves and the fruit capsules are used in the extraction of essential oil, the yield covers a wide range according to the soil conditions, the age and the state of health of the individuals, and to the part of the tree explored. Only old and very strong individuals deliver the extractable material. Results obtained when different lots of raw material were subjected to steam distillation in small vessels under laboratory exactness are tabulated. The essential oil from any one of the mentioned Cedro species is very frequently employed as a specific remedy against psoriasis and erysipelas, also herpetic affections are stated to retrocede after an extended external medication. For the application the oil is incorporated into some animal fat. The writer and his assistants have experienced erythematous phenomena on their own skins after handling essential oils of any of the mentioned species. Other applications of the oil are also given—F. W. FREISE *Perf. and Ess. Oil Rec.*, 26 (1935), 11 (A. C. DeD.)

Peppermint Oil—Report on, from Cyprus. The characteristics of oils distilled from the black and the white varieties of peppermint were $d_{4}^{25} = 0.9137-0.9299$, $0.9182-0.9228$, $[\alpha]_D^{18} = -20.75^\circ$ to -10.84° to -30.3° , $n_D^{20} = 1.4630-1.4634$, $1.4642-1.4660$, acid value 0.8-7.6, 0.5-1.2, ester value 25.9-68.2, 29.8-83.1 (equivalent to menthyl acetate 9.2-24.1, 10.5-29.4 per cent), and ester value after acetylation 200.1-228.4, 169.8-202.6 (equivalent to menthol 65.6-76.8, 54.2-66.6 per cent), respectively. The oil from the black variety was soluble in 2.7-3.0 volumes of 70 per cent alcohol at 15.5°, that from the white variety was insoluble in 13 volumes of 70 per cent alcohol but was soluble in 1.2 volumes of 80 per cent alcohol at 15.5°—*Cyprus Agr. J.* 27 (1932), 56, 28 (1933), 39, through *Chem. Abstracts*, 29 (1935), 292.

Terpenes—Biogenesis of Some. The manner in which certain changes in terpene molecules and precursors of terpenes may occur is postulated. Structural formulas are given—J. WALKER *J. Soc. Chem. Ind.*, 54 (1935), 55 (S. W. G.)

Turpentine—Chios. The history of the drug is traced to earliest writings. A botanical description of the drug is given in full with habitat, etc., along with characteristics of the fruit and resin and uses of the plant. A survey of the literature in regard to the chemical constitution is included. A detailed study of the resin is undertaken. The resin was treated with ether, 7.83 per cent being insoluble, the ether solution was then shaken out with 1 per cent solution of ammonium carbonate and the terminthol acid separated with acid and studied. A second treatment of the ether extract with another alkali solution and then acid removed two acids which were soluble in alcohol. This solution on treatment with alcoholic solution of lead acetate gave an alcohol insoluble lead salt of terminthol acid and an alcohol soluble lead salt of terminthol acid each of which was studied. The ethereal extract on further treatment with alkali and acid yielded terminthol acid. The ethereal extract was distilled, the volatile oil was then steam distilled, salted out, the ether distilled off and the oil studied. On steam distillation of the oil a resin remained behind. A bitter principle was also separated. On dry distillation of the resin, water, a volatile oil and several empyreumatic products were obtained—E. EMMANUEL *Pharm. Acta Helv.*, 10 (1935), 12 (M. F. W. D.)

Fixed Oils, Fats and Waxes

Croton Resin—III. Combined Acids. The resin was saponified with 16*N* alcoholic potassium hydroxide in an atmosphere of nitrogen. Thirty-two per cent of the saponification products were petroleum ether soluble fatty acids. The acids identified were taglic, caprylic, capric, lauric, myristic, palmitic, oleic and linoleic—N. L. DRAKE and J. R. SPIES *J. Am. Chem. Soc.*, 57 (1935), 184 (E. B. S.)

Halibut Liver Oil Factors affecting the production of this oil are (1) origin of the fish geographically and (2) the process of extraction and refinement. It appears as if the viscosity of the oil is related to the amount of vitamin A present as those with high concentrations are very viscous. In order to meet prevailing specifications of free fatty acids (max. 1.41%), it is necessary to neutralize and remove these acids, which treatment causes considerable variation in the constants for the oil. The potency of the oil depends on (1) the age of the fish, (2) the season of the year, and (3) the spawning cycle and food (probably) and ranges from 30 000 International Units per Gm. vitamin A to 160 000–175 000, vitamin content is generally 2000–3000 units per 100 000 units of A. Most of the oil is more potent than the standard now observed and that from the Pacific Coast is twice the 44 800 new U. S. P. Units now recognized. Preferable diluents appear to be corn germ, wheat germ and cottonseed oil and it may be fortified by the addition of viosterol or natural Vitamin D and the addition of other potent oils as swordfish liver oil and tuna oil. Combinations of the oil with other medicaments are mentioned.—H. F. TAYLOR *Drug and Cosmetic Ind.*, 35 (1934), 603–685, 36 (1935) 149 (H. M. B.)

Olive Oil—Occurrence of Unsaturated Hydrocarbon in The authors of this paper have made a thorough study of an unsaponifiable fraction contained in olive oil using an authentic product of Palestine origin. They prepared their material by saponifying the oil in the usual manner, extracting the unsaponifiable portion with ether, purifying it in two ways: fractional crystallization from hot ethyl alcohol and selective adsorption. The latter method was the most satisfactory. The unsaponifiable matter was dissolved in a mixture of 90% petroleum spirit and 10% benzene and passed through a column of Merck's specially purified aluminum trioxide. Four colored zones appeared and these were separated and with the filtrate passing through, examined separately. A spectroscopic examination showed clearly the presence of ergosterol in some of the adsorption bands. The filtrate contained a colorless and odorless mobile oil from which there separated on chilling a small amount of crystalline wax having no iodine absorption value. Analysis of the liquid portion showed it to be unsaturated and of the squalene type containing traces of other things, some of them containing oxygen. Distillation under reduced pressure resulted in a more highly purified fraction. Elementary analysis was made of this purified fraction and the results indicated very clearly that the fraction was almost pure squalene. Both the hydrochloride and the hydrobromide prepared from it when compared with the derivatives from pure squalene showed very close microscopic resemblances. It was further found that the hydrochloride of squalene could be prepared directly from the oil but the yield was not very good. Other samples of olive oil were examined and also one of tea seed oil. The olive oils all contained the hydrocarbon but the tea seed oil did not. A table comparing various constants of pure squalene and those of the hydrocarbon of the olive oil is given and close agreement is shown in practically every respect.—T. THORBJARNARSON and J. C. DRUMMOND *Analyst*, 60 (1935) 23 (A. H. C.)

Glycosides, Ferments and Carbohydrates

Chondrus Crispus—Some Properties of Polysaccharide Complex from A method is described which yields a standard, relatively pure material, largely carbohydrate in nature, with an ash content of approximately 20 per cent of its dry weight, representing the gelatinizing constituent of *Chondrus Crispus*. An extract previously described as an ethereal sulphate of calcium is now shown to be a mixture of sulphates, phosphates, etc. Potassium ammonium and calcium salts of the ethereal sulphates occurring *in situ* have been prepared and examined. More than the theoretical quantity, as calculated on Hass' formula, was lost by ashing the standard extract. A modified formula embodying an acid salt is given. Comparison of the chondrus extract with purified agar showed a similarity in physical properties and origin.—M. R. BUTLER *Biochem. J.*, 28 (1934), 759 through *Physiol. Abstracts* 19 (1935) 566.

Pectins—Survey of Recent Researches on Since pectins have won a considerable place in food industries in recent years and since they have been suggested for certain types of medicaments, the author has compiled this review. While it is based primarily on the work of Ehrlich and his co-workers during the past seventeen years, it covers the history of the subject to a considerable extent. Structural formulas are given and the chemical discussion is rather complete. The review also enumerates several commercial uses for pectins.—E. I. VAN ITALLIE *Pharm. Weekblad* 72 (1935), 2–25 (E. H. W.)

Saponins—A discussion of the history, properties, distribution in the plant kingdom and in parts of plants, and the function of saponins in plants is given. Chemical properties of saponins and their purification are taken up, as well as a study of their constitution in so far as possible. Consideration is given to means of quantitative estimation of saponins by (1) determination of the amount of froth, (2) the so-called hemolytic index, and (3) toxicity toward fish. All saponin containing drugs are classified into four groups according to their uses: (1) purgative and expectorant drugs, (2) blood purifiers, (3) diuretics, (4) nutrient saponin containing drugs. A few of the uses of saponins in pharmacy and medicine are listed.—K. LEUPIN. *Pharm. Acta Helv.*, 10 (1935), 22 (M F W D)

Other Plant Principles

Pterocarpin—Identification of Constituents of Red Sandalwood. According to elementary analysis, the formula for pterocarpin may be either $C_{17}H_{14}O_4$ (proposed by Rast) or $C_{17}H_{14}O_4$. The analysis for the bromine content of monobrompterocarpin corresponds to the formula $C_{17}H_{14}O_4Br$, thus verifying $C_{17}H_{14}O_4$. The monobrom derivative was obtained in the form of colorless needles, melting at 165° . It is suggested that pterocarpin differs from homopterocarpin ($C_{17}H_{14}O_4$) in that it contains a methylene oxide group instead of two methoxyl groups. Pterocarpin gives a positive test for the methylene oxide group by the reaction of Lahat, Pictet and Kramers and also the color test of Weher and Tollens. Free hydroxyl groups are not present, since pterocarpin is neither soluble in sodium hydroxide solution nor is it acetylizable. It condenses with difficulty with 2,4-dinitrophenylhydrazine to form dark reddish brown, glistening needles having the formula $C_{23}H_{18}O_8N_4$, m.p. 305° . Pterocarpin contains, in addition to a carbonyl group, an oxygen atom bound in an ether like linkage since reduction results in the formation of phenolic hydroxyl. Fusion with caustic potash converts pterocarpin to resorcin.—H. LEONHARDT and K. FAY. *Arch. Pharm.*, 273 (1935), 53 (L L M)

Unclassified

5,5-Alkylphenylbarbituric Acids—Synthesis of. The following 5,5-alkylphenylbarbituric acids were synthesized, viz., the ethyl, isopropyl, isoamyl, *n*-hexyl and *n*-heptyl phenylbarbituric acids. The method was as follows: Phenylacetoneitrile was condensed with diethylcarbonate, using sodamide as the condensing agent in absolutely anhydrous ether and with efficient stirring and refluxing and yielding ethyl cyanophenylacetate. The cyanophenylacetate is alkylated and the resulting cyanoalkylphenylacetate is condensed with urea in ether, alcohol or absolute alcohol in the presence of sodamide or sodium ethylate. The resulting 5,5-alkylphenyl 4-aminobarbituric acid is hydrolyzed in 33*N* hydrochloric acid to the 5,5-alkylphenylbarbituric acid. Yield 19-2%. The acids other than luminal are synthesized for the first time by this method and their physical constants and the physical constants of the intermediate products are given. The pharmacological evaluation has not been given.—J. S. CHAMBERLAIN, J. J. CHAP. J. E. DOYLE and L. B. SPAULDING. *J. Am. Chem. Soc.*, 57 (1935), 352 (E B S)

Aurothiosulphates of Quinine, Ammonium and Calcium—Preparation and Properties of. Quinine aurothiosulphate is prepared by using a concentrated solution of quinine hydrochloride with sodium aurothiosulphate, and constantly stirring. A white precipitate forms which turns pale yellow. After washing and drying, amorphous pale yellow masses appear with some crystals. The compound is soluble in water at 9° C. to the extent of 0.46 Gm. per liter, and at 100° C.—24.3 Gm. per liter. It is insoluble in organic solvents, stable in air and at 150° C. decomposes slightly. Ammonium aurothiosulphate is obtained by displacing quinine from its aurothiosulphate by ammonium, by treatment with excess ammonium hydroxide. It is a white amorphous solid, very soluble in water, but insoluble in organic solvents and decomposes very easily. Calcium aurothiosulphate is prepared by treatment of calcium hyposulphite and gold chloride. The calcium compound is dissolved out with alcohol, and when purified it is colorless. The compound after twenty-four hours contained ten molecules of water, but after four months contained six molecules of water. It is very soluble in water, insoluble in organic solvents and very hygroscopic. Heating to 100° C. does not change it, but at 250° C. decomposition takes place. *Chemical properties*—They dissolve in dilute acids. Diluted hydrochloric acid causes formation of a sulphate. Diluted sulphuric acid causes formation of colloidal gold. Diluted nitric acid forms sulphur precipitate and sulphurous acid. Other tests and reactions prove Fordos and Gelis' hy-

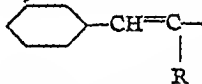

pothesis that gold is monovalent in the compound. Reactions with hydroquinone pyrogallol, potassium permanganate and tannin result in the formation of metallic gold. Reactions with reducing agents were also given.—M M PRION *J Pharm et chim*, 21 (1935), 101 (M M Z)

Isobutyl Groups—Introduction of, into Phenols, Cresols and Homologous Compounds The isobutyl derivatives were made by the rearrangement of the methylallyl phenol ether to the corresponding methylallyl phenol, and the catalytic reduction to the isobutyl phenol. Tests showed the isobutyl radical did not enhance the germicidal action of the phenols to as great an extent as did the normal butyl and higher alkyl radicals.—Q R BARTZ, R F MILLER and R ADAMS *J Am Chem Soc*, 57 (1935), 371 (E B S)

Phenols—Molecular Compounds of A series of molecular compounds formed by cineole and *m* 5 xylydine with different phenols is given. The molecular proportions and melting points are tabulated.—G T MORGAN and A E J PETTET *J Soc Chem Ind*, 54 (1935), 22T (S W G)

Tartrates and Racemates The various crystal forms of tartrates and racemates are reviewed and illustrated. A structural formula is given to explain the unusual behavior of some of the compounds.—T M LOWRY *J Soc Chem Ind*, 54 (1935), 28 (S W G)

Tetrahydronaphthalene Peroxide—Preparation of Satisfactory yields of this article by the oxidation of tetrahydronaphthalene (tetralin) are obtained only by aspirating air through the tetralin for a period of about 45 hours. It was found that the best solvent for the recrystallization of tetralin peroxide was a mixture of 22 cc, ethyl acetate and 70 cc of petroleum ether for each 70 Gm of the peroxide. The product recrystallized three times from this solvent mixture melted at 56° C.—W NUSSLE, JR, G W PERKINS and G TOENNIES *Am J Pharm* 107 (1935), 29 (R R F)

Urethanes—Study of a New Series of Report is made of a study of two urethanes 2-methyl cinnamyl urethane and 2 amyl cinnamyl urethane. Details of experimental work are given. Both were found to be inactive as hypnotics. Since urethanes in general are not rapidly hydrolyzed in the animal organism the conclusion was that there was no hypnotic activity in the  grouping or that the urethanes are not readily absorbed, probably the

latter since the corresponding amides are active.—W A LOTT and W G CHRISTIANSEN *J Am Pharm Assoc*, 24 (1935), 22 (Z M C)

BIOCHEMISTRY

Enzyme Activity—Effect of Certain Salts on The toxicity of sodium salts of selenium, vanadium, arsenic and tellurium toward the production of carbon dioxide during yeast fermentation of glucose is in the order named. Sulphur shows some acceleration, depending on the form used, and probably is in direct correlation with the hydrogen sulphide concentration. The toxicity of the sodium salts of selenite, selenide and selenate decreases in the order named. An accelerating effect is shown by sodium sulphide and, to a lesser degree, by sulphite. The sulphate shows a slight retarding effect. Sodium sulphide counteracts the toxic effects of selenium considerably. Elemental sulphur has no accelerating effect and only slightly counteracts the toxic effects of selenium even in the ratio of 20 to 1. Sodium sulphide, ammonium sulphate and sodium thiosulphate are also unable to counteract the toxic effect of selenium.—A L MOXON and K W FRANKE *Ind Eng Chem*, 27 (1935), 77 (E G V)

Gonadotrophic and Estrogenic Principles—Occurrence of, in Myoma of Uterus Assay of a human uterine fibroid showed the tissue to contain 4½ rat units of follicle stimulating and luteinizing factors per Gm of desiccated tissue. The extract gave both effects. The estrogenic assay of this material revealed 4 units per Gm of tissue or 1800 units per pound. The history of the patient from whom the fibroid was removed is given.—D LEWIS and C F GESCHICKTER *J Am Med Assoc*, 104 (1935), 45 (M R T)

Male Sex Hormone—Extraction of, from Urine Urine is acidified with hydrochloric acid, heated to 80° C for 5 hours, cooled, mixed with milk of lime, and filtered. The filtrate is treated with soda ash and filtered. The filtrate is extracted with benzene in a continuous extraction apparatus, of which a diagram is given. Benzene extracts fewer impurities than chloro-

form—Y WANG and H WU *Chin J Physiol*, 8 (1934), 209, through *Physiol Abstracts*, 19 (1935), 672

Oestrin and Luteohormone A review of the methods of assay, the isolation method and the structural chemistry of oestrin and the lutean hormone—K PEDERSEN-BJERGAARD and B KONSTANTIN HANSEN *Dansk Tids Farm* 9 (1935), 29 (C S L)

Vitamin C in Bulk References are made to the method of Szent Gyorgyi for preparing pure vitamin C in large quantities from certain peppers of the genus capsicum, to the possibility of a test for latent scurvy or prescurvy by estimation of the vitamin C content of the urine, and to the synthesis of l-ascorbic acid or active vitamin C The vitamin C excreted by the urine varies according to the vitamin C reserves or 'saturation' of the person tested—*Lancet*, 1 (1935), 100 (B S R)

ANALYTICAL

Aconitine—Detection of, in Aconite Root A tentative method was adopted The sample is macerated with water and extracted with ether in the presence of ammonium hydroxide The washed ether layer is extracted with 0.02N sulphuric acid until acid to methyl red The acid aqueous layer is treated with 5% sodium carbonate solution, heated to 60°, cooled and examined for crystals—*J Assoc Official Agr Chem*, 18 (1935), 84 (G S W)

Aldehydes and Ketones—Improved Hydroxylamine Method for Determination of Displacement of Oxime Equilibria by Means of Pyridine A 0.5N solution of hydroxylamine is prepared by dissolving 35 Gm of hydroxylamine hydrochloride in 160 cc of distilled water and diluting to one liter with 95 per cent ethanol A solution of 20 cc of pyridine and 0.25 cc of 4 per cent alcoholic bromphenol blue indicator is made up to 1 liter with 95 per cent ethanol A standardized 0.5N sodium hydroxide solution in methanol is used for acidimetry Thirty cc of hydroxylamine hydrochloride reagent and 100 cc of the pyridine bromphenol blue solution are run into a 300 cc citrate of magnesia bottle The weighed or measured sample (never equivalent to more than 1/3 of the reagent) is added The bottle is capped and allowed to stand at room temperature or heated in a steam bath The time necessary depends upon the aldehyde or ketone and a table of optimum times is given for about 30 compounds In most cases two hours' heating is sufficient A blank for use as a color standard is run for each set of determinations The pyridine hydrochloride in the reaction mixture is then titrated until the indicator color matches the blank Precautions to be used are given and the effects of groups adjacent to the carbonyl group are discussed Results were within plus or minus 1 per cent of the theoretical—W M D BRYANT and D M SMITH *J Am Chem Soc* 57 (1935), 57 (E B S)

Amidopyrine and Dinitrophenol (2,4)—Detection of Tentative microchemical methods were adopted Crystals are obtained from a water solution of amidopyrine by the addition of either mercuric chloride (5 Gm in 100 cc of water) or Marmer's solution (3 Gm of cadmium iodide in 18 cc of water containing 6 Gm of potassium iodide) A solution of dinitrophenol in sodium hydroxide (0.1N), acidified with 1% hydrochloric acid produces characteristic crystals Comparisons are made against controls Descriptions of the crystals are given—*J Assoc Official Agr Chem*, 18 (1935), 86 (G S W)

Anesthetics—Special Detection of Cocaine and Novocaine, with Reference to Smuggled Goods The Zwikker reagent for Cardiazol (*Pharm Weekblad*, Oct 20, 1934), cuprous chloride (CuCl) has been adapted as a microchemical reagent giving the following reactions with anesthetics with Aconine—no reaction, with Allylocaine nitrate—a compact mass of yellow rosettes of needles, with Aल्पine—yellow parallelograms which disappear rapidly, with Anesthesin hydrochloride—large yellow plates, sometimes branching, with Buteline—a yellow undifferentiated mass, with Cocaine hydrochloride—lemon-yellow fine feathery rosettes beginning thread like but increasing in thickness, Cycloform—green fine rosettes of needles, Diocaine—no reaction, Eucaine A—light yellow rosettes with outward pencil like branching forms, Eucaine B—no particular reaction, Holocaine—no reaction, Larocaine—a clear yellow liquefying mass, Novocaine—yellow very small thin needles sometimes grouped in crosses, but yet so soluble that a good result is only obtained by placing the preparation in a desiccator Differentiation from cocaine hydrochloride is obvious This is one of the reactions in which cocaine hydrochloride reacts quickly and satisfactorily while novocaine gives as good as no reaction Nycaine—beautiful emerald-green, three-sided columns with oblique ends The most beautiful reaction with this

reagent Orthoform—several variable forms, long needles (possibly the reagent) light yellowish green columns and four-sided crystals of the sulphite, Orthoform New—gray green needles usually in large rosettes, Pantocaine—a hygroscopic yellowish mass in which no characteristic forms appear, Percaine—lemon yellow rosettes not characteristic, Propacaine—many crystals but none which can be described as characteristic Psicaine—bluish gray plates mostly four-sided The only material which gives this color Psicaine New hydrochloride—yellow columns with oblique ends, Stovaine—greenish yellow columns with chisel like ends, Subcutine—dirty brown large forked plate-like needles, Tropocaine—green elongated needles which tend to group in rosettes, emerald-green parallelograms not however resembling those obtained with nycaine, were also obtained, Tutocaine—yellowish golden mass without characteristic form Photomicrographs of some of the crystals are given Since cocaine often occurs with other anesthetics especially in illegal goods the authors attempt to devise methods for its detection in the following combinations Anesthetic Cocaine Eucaine A or B Cocaine, Larocaine Cocaine Pantocaine-Cocaine, Percaine Cocaine, Stovaine-Cocaine Subcutine-Cocaine and Tutocaine Cocaine Recent literature is reviewed and several methods of separation (i.e. solvents, etc.) and identification (PtCl₄, Picric acid etc.) are discussed The paper is to be continued — C OFFERHAUS and C G BAERT *Pharm Weekblad* 72 (1935) 82 (E H W)

Aromatic Waters—Distillation of, for Determination of Volatile Constituent The apparatus consists of a 1-liter steam-generating Pyrex flask surmounted by a wide-neck 2 liter separator connected to a vertical condenser An air inlet is provided in the steam generator flask to avoid the building up of excessive pressure After complete removal of the volatile matter, the aromatic principles are extracted with ether in presence of sodium chloride, the solution is dried with calcium chloride, the bulk of the solvent is evaporated on a water bath and the last traces under high vacuum at 22–24° — A GUILLAUME and MME ADNOT *Documentation sci* No 23 (1934) 84, *Chimie and industrie* 32, 644 through *Chem Abstracts*, 29 (1935) 886

Barbitals—Titration of, with Silver Nitrate The author described the method of Budde in which a molecular quantity of the barbitol is dissolved in a solution of one gram of anhydrous sodium carbonate in 30 Gm of water and titrated with N/10 silver nitrate The end-point is reached when a slight milky cloudiness appears This method is preferred to the alkalimetric method since no indicator is necessary and the end point is sharp The author finds that the pharmacopoeial method and the silver nitrate method may be combined He substitutes N/10 sulphuric acid for N/10 hydrochloric acid, uses only a small amount of indicator and when the end point is reached adds an additional 10 Gm of water and 1 Gm of anhydrous sodium carbonate and continues with the silver nitrate titration He gives the following results

		Cc N/10 Alkal		Cc N/10 AgNO ₃	
Luminal verum	232 mg	9 7		9 5	9 8
Dial verum	208 mg	9 6		10 0	
Luminal loco	232 mg	9 7		9 7	9 9 10 2
Dial loco	232 mg	9 8	10 0	10 0	10 0
		Cc N/10 H ₂ SO ₄		Cc N/10 AgNO ₃	
Medinal loco	206 mg	9 4		10 7	

J M A HEGLAND *Pharm Weekblad* 72 (1935) 128

(E H W)

Benzaldehyde—Determination of Small Quantities of Chlorine in Commercial For this purpose a modification of the Schummel and Company method is recommended (*Bericht der Schummel and Co* 1919–1926) Details of the method are as follows the lamp used being a Richardson Lamp as described in *J Inst Pet Tech* 7 (1921) 26 "The two rolls of silver gauze A (to free incoming air from chlorine), and B (to collect chlorine in the oil) are first cleaned by immersion in ammonia solution (sp gr 0.880), washed with water dried and gently heated in a flame They are then slid into silica tubes (in which they fit tightly) being followed by asbestos plugs and finally by rubber stoppers The lamp is filled with benzaldehyde, the wick (not glass capillaries) is adjusted to give a small flame and the whole is weighed The rest of the Richardson apparatus is connected (without the usual absorption tube) with the silica tubes placed side by side in iron gauze shields These tubes are heated to dull redness before the apparatus is connected with the suction pump The lighted lamp is then slid into position the air-flow is adjusted to give a small non-smoky flame and the shield is slipped down on to the mercury seal The

benzaldehyde is thus burning in a chlorine free stream of air, and the products of combustion are freed from chlorine by the hot silver gauze, B. When sufficient benzaldehyde has been burnt (this depending upon the expected chlorine content) the lamp is removed and re weighed. When cool, the tube with gauze, B, is disconnected, the ends, inside and outside, are cleaned, and, without removal of the gauze, placed in a test-tube. Three successive portions of 1.5 cc of ammonia (sp gr 0.880) are dropped on to the gauze, and after this has been left for 10 minutes some 5 cc of water are used for washing the gauze and tube. The dilute ammonia solution is then acidified with a minimum quantity of nitric acid, a few drops of silver nitrate solution are added, and the precipitated silver chloride is left to settle. Coagulation is assisted by the addition of a few drops of ether. The silver chloride is collected in a Gooch crucible, washed first with *N*/100 nitric acid and then with absolute alcohol, dried at 125° C, cooled and weighed. It is then dissolved in ammonia, and the crucible is re weighed. Usually a few tenths of a milligram of carbon remain undissolved. The table showing results on commercial oils and on samples containing known amounts of chlorine and also so called chlorine free oils is given. The method gives excellent results and it is interesting to note that any sample of oil of bitter almonds contains about 0.001% of chlorine.—C. G. DAUBNEY, *Analyst*, 60 (1935), 29 (A. H. C.)

Cane Sugar Content of Small Volumes of Solutions—Determination of, from Specific Gravity and Specific Rotation. The apparatus for the determination of specific gravity consisted of a Kuhlmann micro balance and a glass capillary 6–8 cm long and having a capacity of 5–30 mg of distilled water. Three determinations are made with three different capillaries and the average value is computed. The average error by the micromethod was 1.8 per cent of the sugar content as compared to an error of 1.3 per cent by the macromethod. The values for micro specific gravity determinations are useful in the calculation of specific rotation by micro polarization methods.—R. BEUTLER, *Mikrochem*, 16 (1935), 133 (L. L. M.)

Carbon—Modified Chromic Acid Method for the Determination of. The apparatus consists of a 300 cc Kjeldahl flask, fitted with a combined acid reservoir and air inlet and a large glass double surface condenser. The end of the delivery tube from the condenser is connected to a hard glass combustion tube, 15 in long filled with powdered lead chromate and copper oxide wire, and plugged with copper gauze spirals. The combustion tube is placed within a shorter length of copper or iron piping, giving a good distribution of heat. The gases are led from the combustion tube through an absorption tube containing pumice chips and sufficient concentrated sulphuric acid to form a lock, and following this into a potash bulb with a calcium chloride tube and two soda lime tubes, the first of which also contains calcium chloride. The substance to be examined, sufficient to give 0.5 to 1 Gm of carbon dioxide, is placed in the flask together with potassium dichromate, after sweeping out, sulphuric acid is added and the mixture heated until the reaction is completed.—I. M. ROBERTSON and J. M. SHEWAN, *J Soc Chem Ind*, 54 (1935), 35T (E. G. V.)

Carotenoids—Rapid Quantitative Method for the Determination of the Common Analysis of Beta-Carotene and Leaf Xanthophyll in Thirteen Plant Tissues. A rapid quantitative method for determining carotenoids without separating the components of a plant extract is given. The samples (5 Gm green weight) are macerated with 25 cc of acetone and 25 Gm of quartz sand, the extract decanted into a 250 cc Erlenmeyer flask and 2 cc of 95% ethanol saturated with potassium hydroxide is added. This is separated three times with acetone and twice with 35 cc portions of ether. The pulp and sand are transferred to a Soxhlet extractor and extracted 30 to 60 minutes with ether. This extract contained 30 γ or less of carotenoids. The combined extracts are transferred to a 3 liter separatory funnel containing 1.5 liters of distilled water whirled gently and allowed to separate for five minutes. The aqueous layer is drained into a second separatory funnel. The contents of the second separatory funnel are extracted with 100 cc of ether and the ether washings added to the first funnel. The ether extracts are washed four times with 500-cc portions of distilled water and separated. The ether solution is evaporated *in vacuo* in a 500 cc balloon flask to 50–60 cc, transferred to a 100 cc graduate and made up to volume. The solution is analyzed the same day by the spectrophotoelectric method described by Zscheile, Hogness and Young and the analytical procedure devised by Miller.—E. S. MILLER, *J Am Chem Soc*, 57 (1935), 347 (E. B. S.)

Chloride—Modified Volhard Method for the Determination of. To the chloride solution, acidified with nitric acid, there is added 1 cc of nitrobenzene for each 0.05 Gm of

chloride The nitrobenzene, attaching itself to the silver chloride, inhibits the darkening of the latter in light and improves the end-point when back-titrating with potassium thiocyanate—J R CALDWELL and H V MOYER *Ind Eng Chem, Anal Edt*, 7 (1935), 38 (E G V)

Cinchona Bark and Cinchona Decoctions—Alkaloid Content of The Keller-Fromme method of assay (*Pharm Ztg*, 64 (1923), 57) for the alkaloid content of cinchona bark was studied and found to give results which were higher according to the degree of pulverization of the drug The present authors recommend analysis of finely powdered material (Danish Pharmacopœia, sieve No 50) No relationship was found, however, as to the quantity of alkaloid extracted in the process of preparation of simple or acidic cinchona decoctions, whether the drug was of the coarseness to pass sieve No 3 or finer, up to material passing sieve No 50 On fractional sieving different fractions were found to vary in alkaloid content (between 6.83 and 10.30%) even if they were then ground fine before analysis—A JACOBSEN and S A SCHOU *Dansk Tids Farm* 9 (1935), 1 (C S L)

Cocaine—New Falsification of The substance examined was a white powder, which appeared to be cocaine hydrochloride, yet it possessed a melting point of 94° C as compared to a melting point of 186–190° C for pure cocaine hydrochloride A solution of the substance gave general alkaloidal tests similar to cocaine By means of different solubilities in cold distilled water a substance equivalent to one third of the weight of the original amount used was separated The substance did not resemble the common adulterants such as boric acid, sugar, sodium bicarbonate, etc, but appeared to be a hypnotic such as sulphonal It contained no sulphur When it was sublimed an odor of benzoic acid was perceived Further study showed this substance to be ethylpara-aminoethyl benzoate or anesthesine (m p 90° C) Precipitates of cocaine and anesthesine with alkaloidal reagents differ only in dilute solution—E COLLARD *J pharm chim*, 21 (1935), 57 (M M Z)

Copper—Detection and Determination of, in Pharmaceutical Preparations To 2 cc of the solution (approximately 0.1N in hydrochloric acid and with a maximum of 1 mg of iron) are added 50 mg of ammonium fluoride to mask the iron as (FeF₆)³⁻, followed by 1 drop of 5 per cent aqueous zinc sulphate and 0.5 cc of aqueous ammonium mercuric thiocyanate (from 8 Gm of mercuric chloride + 9 Gm of ammonium thiocyanate in 100 cc of water) With a minimum of 5 × 10⁻⁶ Gm of copper or cobalt a violet coloration is produced Small amounts of copper were found in various preparations—F FEIGL and P KRUMHOLZ *Sci Pharm*, 5 (1934) 19 through *J Soc Chem Ind*, 54 (1935), 45B

Copper in Milk—Determination of Minute Amounts of A 25- to 200 cc sample of milk, to which 5 drops of glacial acetic acid has been added to prevent foaming, is evaporated over a free flame After most of the carbon is burned the platinum or quartz crucible containing the residue is ashed in a muffle furnace at 565° C for 2 to 3 hours The ash is dissolved in from 1 to 8 cc of 20 per cent hydrochloric acid and the warmed solution is centrifuged at 1800 r p m for 10 minutes to throw down carbon The solution is then neutralized with ammonium hydroxide and hydrochloric acid added to make it 1 per cent after bringing to the 10 cc volume The solution is saturated with hydrogen sulphide, stoppered and allowed to stand over night After centrifuging the copper sulphide is dissolved with 4 drops fuming nitric acid The tube is heated for 10 minutes, then cooled, diluted and ammonium hydroxide is added to give a distinct color, the solution is then made up to 10 cc Any turbidity is removed by centrifuging An aliquot containing from 0.001 to 0.005 mg of copper is taken for the colorimetric estimation with 1 cc of 0.1 per cent sodium diethyldithiocarbamate, the yellow color is compared with a standard The copper content of raw milk was found to average 0.077 parts per million Pasteurized milk and dried milk contain more copper—L W CONN, *et al* *Ind Eng Chem, Anal Edt*, 7 (1935), 15 (E G V)

Copper—Iodometric Determination of The procedure is carried out in the usual manner until most of the iodine is consumed by the standard sodium thiosulphate At this point 0.5 to 1.0 cc of 4 per cent alcoholic solution of white shellac is added slowly while swirling the contents of the flask The precipitate is allowed to settle for 20–30 seconds and the titration completed The shellac solution causes a rapid settling of the turbid precipitate, thus making the end-point more easily observed—J R CALDWELL *J Am Chem Soc*, 57 (1935), 96 (E B S)

Ergotamine—Determination of, in Ergot A tentative method was adopted The alkaloids are extracted with ether from an ammonium hydroxide solution, washed and extracted with

tartaric acid solution (1%) The ether is removed by evaporation and aliquots treated with dimethylaminobenzaldehyde solution (1.25 Gm of dimethylaminobenzaldehyde per liter in a solution containing 650 cc of sulphuric acid and 0.05 Gm of ferric chloride) The solution is compared in a colorimeter with either ergotamine ethanesulphonate or ergotamine tartrate as standards Results are expressed as per cent of ergotamine tartrate or ergotamine ethanesulphonate—*J Assoc Official Agr Chem*, 18 (1935), 88 (G S W)

Essential Oils—Average Values for Surface-Tensions of A table containing the surface tensions of various essential oils determined at 20° C in dynes per centimeter is given—A MÜLLER *Perf and Ess Oil Rec*, 26 (1935), 18 (A C DeD)

Essential Oils—Viscosity Surface Tension, and Capillariscope Behavior of The specific viscosities (η) and surface tensions (γ) of 130 essential oils (including varieties of the same oil) are determined by a dropping method About 86 per cent of the oils investigated have $\eta = 2-10$ cp, while 70 per cent have $\gamma = 27-30$ dynes/cm A capillariscope, involving the dropping of the oil on to filter paper is described (cf *A*, 26 (1932), 803) The diameter of the spreading drop is measured at intervals of 5 minutes (up to 60) and results are expressed graphically Various factors determining capillary behavior are discussed—A MÜLLER *J pr Chem*, 141 (1934), 167 through *J Soc Chem Ind* 54 (1935), 46B

Ferrum Reductum—Evaluation of, by the Sublimite Method For testing reduced iron the U S Pharm and Merck's book on testing chemical reagents recommend heating 1 Gm of the iron with 10 Gm of mercuric chloride for 5 minutes and then titrating the resulting ferrous chloride solution with potassium permanganate The results obtained with 10 Gm of mercuric chloride are shown to be too low because of the mercurous chloride enclosing some undissolved iron Higher and more accurate results are obtained by using only 5 Gm of mercuric chloride If it is desired to use more mercuric chloride the sample should be treated first with only 5 Gm and the remainder added only after a preliminary boiling of about 1 minute Instead of mercuric chloride 10 Gm of mercurous chloride can be used for 1 Gm of iron but this has no advantage—L WEISS *Z anal Chem* 98 (1934) 397, through *Chem Abstracts*, 29 (1935), 292

Galactose—Detection of Provoked, in Urine According to Technique of Fiessinger, and Application of Method of Fleury and Marque The authors find that the Baudouin and Levin method as applied by Fleury and Marque is best for the detection of galactose This method involves the purification of the urine with mercuric nitrate by introducing into a 100 cc round flask 5 cc of urine accurately measured, 50 cc of water, 5 cc of mercuric nitrate reagent and 5 cc of normal salt solution The mixture is stirred and diluted to 100 cc with diluted nitric acid This is filtered and 5 to 20 cc of the filtrate is placed in a conical graduate and to it are added successively 3 cc of solution of mercuric iodide 5-cc normal saline solution, 5 cc of a suspension of barium sulphate and water up to 80 cc This mixture is immersed in a boiling water bath for 6 to 8 minutes, then cooled, and 5 cc of 20 per cent sulphuric acid is added The mixture is cooled again, and 5 cc of 0.1N iodine reagent is added After stirring for some time the excess iodine is titrated with 0.1N sodium thiosulphate with the aid of a microburette A coefficient was determined for galactose 1 cc 0.1N iodine equals 5.37-mg galactose—W R HAZARD M HERBAIN and C VAILLE *J pharm chim* 21 (1935), 61 (M M Z)

Graduates—Inaccuracy of Glass The author discusses allowable variation in graduated apparatus and gives tables of results obtained in checking 25 graduates Some show considerable inaccuracy while others are fairly accurate The author concludes that older graduates, which are not mechanically graduated are usually the most accurate He finds that fancy graduates with colored or molded graduations are usually not very accurate and that there is often a variation in accuracy among graduates of the same manufacture—P VAN DER WIELEN *Pharm Weekblad*, 72 (1935) 34 (E H W)

Acacia—Identification Reactions for The ferric chloride borax and alcohol reactions of the Netherlands Pharmacopœia did not give satisfactory reactions, the precipitates dissolving upon shaking Upon increasing the pharmacopœial concentrations five times, ferric chloride gave a gelatinous brown precipitate, 0.100 Gm of borax a gelatinous white precipitate and 5 cc alcohol a white precipitate The identification reaction with basic lead acetate was visible in dilutions of 1:10,000 With the latter reaction the author advises that a blank be run especially if the lead precipitate is not immediately visible It is advised that the following reaction be added to the above 1 drop of hydrogen peroxide (3%) is added to 5 cc of a 5%

solution of the gum to which a trace of benzidine has been added. Within a few minutes the solution will assume the color of benzidine blue. The solutions should be made in the cold so that the peroxidase will not be destroyed through the heat of reaction. The author found that old gums required a greater concentration to give a positive reaction and suggests that the peroxidase content of the gum diminishes with age.—I. C. RITSEMA *Pharm Weekblad*, 72 (1935) 105 (E. H. W.)

Acacia—Mucilage of, and Detection of Oxidase in. Qualitative and quantitative tests for oxidase and peroxidase in mucilage of acacia are reviewed.—M. SİDO *Pharm Ztg*, 80 (1935), 12 (G. E. C.)

Henna—Evaluation of. Since henna, is used principally for dyeing hair, methods of judging the quality of a sample must have reference to its dyeing properties. The British Pharmaceutical Codex, 1934, describes a test for henna in which white knitting wool is used. The color produced however, does not compare closely with that produced when human hair is used. The best results were obtained by using pure white fine drawn mohair. The procedure is as follows. Weigh out 2 Gm. of white mohair and tie into a hank. Wash first in 0.1N borax solution, then in distilled water and finally dry in the steam oven. Take 4 Gm. of henna in a No. 60 powder and mix thoroughly with 20 cc. of boiling water. Immerse the mohair in the mixture and allow to remain for thirty minutes, after which wash the hank thoroughly and then dry in the steam oven. When dry, press the hank between two microscopic slides and secure them in position by means of rubber bands slipped over the ends. Match the color in the B. D. H. Lovibond tintometer, using the artificial light attachment and by reflected light normal to the surface at 90°.—W. A. N. MARKWELL *Chem and Drugg*, 122 (1935), 157 (T. G. W.)

Homatropine, Hyoscyamine, Scopolamine—Detection of. Tentative microchemical methods were adopted. A drop of gold chloride (1 Gm. of reagent gold chloride in 20 cc. of water) is added to a drop of the alkaloidal solution and the crystals formed are compared with crystals from a control solution. Description of the crystals is given.—J. Assoc. Official Agr. Chem., 18 (1935), 86 (G. S. W.)

Hydrogen Sulphide—Quantitative Estimates of, in Lotions Used in Treatment of Acne. Relative values are given for the hydrogen sulphide content of various lotions used in the treatment of acne vulgaris.—H. GOODMAN *Arch. Dermatol. Syphilol.*, 28 (1933), 847, through *Chem. Abstracts*, 29 (1935), 290

Hypochlorite Solutions—Determination of Available Chlorine in, by Direct Titration with Sodium Thiosulphate. The reaction between sodium thiosulphate and hypochlorite solutions was studied quantitatively. (a) By titrating an acetic acid solution of sodium hypochlorite with 0.1N sodium thiosulphate solution, using starch-potassium iodide paper as an outside indicator, (b) by adding an excess of potassium iodide to an acetic acid solution of sodium hypochlorite, and titrating the liberated iodine with the thiosulphate solution using starch solution as an internal indicator. Results show that thiosulphate, added to an acetic acid solution of a hypochlorite, is completely oxidized to the sulphate and that eight equivalents of chlorine are used per mole of sodium thiosulphate.—V. A. WILLSON *Ind. Eng. Chem., Anal. Ed.*, 7 (1935), 44 (E. G. V.)

Hypophosphites—Determination of. A tentative method was adopted. Total hypophosphites are determined as magnesium pyrophosphate, following a procedure analogous to that for phosphoric acid. Calcium is determined on the same prepared solution by precipitation as the acetate and conversion to the sulphate.—J. Assoc. Official Agr. Chem., 18 (1935), 87 (G. S. W.)

Iodine—Determination of, in Plant Material. A tentative method was adopted. The sample, mixed with calcium oxide and copper oxide is ignited in a combustion furnace. The vapors are drawn over hot platinized asbestos and absorbed in potassium carbonate solution. The residual ash is leached and the solution obtained combined with the carbonate solution evaporated to dryness, taken up with water and extracted with alcohol. The alcoholic extract is evaporated to dryness, ignited, dissolved in water, treated with sulphuric sulphurous acids and extracted with carbon disulphide in the presence of sodium nitrite. The carbon disulphide extracts are compared in a colorimeter with standards. The results are expressed in parts per million or per billion.—J. Assoc. Official Agr. Chem., 18 (1935) 73 (G. S. W.)

Iodide—Method for the Colorimetric Determination of Small Quantities of, in Presence of Other Halides. This method is based upon the oxidation of the iodide with nitric acid and its

subsequent extraction with carbon tetrachloride and determining the quantity of iodine by colorimetric comparison with standard solutions of iodine. The authors point out that the use of acid permanganate is impractical when fluorides, chlorides or bromides may occur along with an iodide but that nitric acid of proper concentration is entirely satisfactory. Full details of the procedure and tables showing its accuracy are given.—A C BOSE and K N BAGCHI *Analyst* 60 (1935), 80 (A H C)

Reduced Iron—Note on the Assay of. Report is made of experimental work which compares the proposed method for U S P XI with a modification of the British Pharmacopœia. The U S P XI method heats mercuric chloride solution and reduced iron on a water bath for ten minutes instead of boiling for five (U S P X) and the B P method is with copper sulphate. Comparative results are tabulated, probable error calculated. In the presence of ferric oxide, ferrous sulphide and ferrous phosphide, the copper sulphate method did not give the best results. The mercuric chloride method gave absolute values in the presence of these impurities.—M OAKLEY and J C KRANTZ, JR *J Am Pharm Assoc*, 24 (1935) 9 (Z M C)

Lead—Electrolytic-Colorimetric Method for the Microdetermination of. The solution to be analyzed is placed in an electrolytic beaker together with 4 cc of nitric acid (sp gr, 1.42), 8 drops of 3 molar sulphuric acid and enough water to make the volume 35 cc. The anode is a small platinum gauze cylinder and the cathode a spiral of platinum wire. The solution is electrolyzed for 12 to 18 hours at 10 volts with a current of 0.05 ampere, the anode is taken from the solution just as the current is short circuited. After rinsing, the anode with the lead peroxide deposit is heated at 180° C for 2 hours and when cold weighed against its tare. The solution remaining after electrolysis together with the liquid from the anode washing is evaporated over a steam bath to 10 cc. In each of two 50 cc Nessler cylinders there are placed 2 cc of 10 per cent potassium cyanide, 5 cc of 6N ammonium hydroxide and 2 Gm of ammonium acetate. The solution from the casserole is placed in one cylinder and a known amount of a lead nitrate solution, containing 0.01 mg of lead per liter, is placed in the other, the cylinders are filled to the mark and 3 drops of sodium sulphide solution added to each. The solutions are then compared in a Leitz colorimeter. Small amounts of lead, 2 to 15 mg, can thus be determined with an error well below 1 per cent.—M RANDALL and M N SARQUIS *Ind Eng Chem, Anal Edit* 7 (1935), 2 (E G V)

Lead in Urine—Quantitative Spectrographic Determination of. The spectrographic determination of lead in urine is described. A Bausch and Lomb Littrow type quartz spectrograph, capable of taking the region $\lambda 2100$ to $\lambda 8000 \text{ Å}$ on three 25 cm plates was used. An arc between 7-mm Achson regraphitized spectrographic electrodes whose spectra did not show a lead line was adopted as a means of excitation. The quantity of lead excited by the arc was determined by inserting a revolving logarithmic sector in the light beam between the arc and the spectrographic slit. Bismuth is used as the internal standard. The lead line $\lambda 2833.2 \text{ Å}$ and the bismuth line $\lambda 2898.1 \text{ Å}$ were used. The preparation of solutions and method of calculating quantity of lead from the photographic plates are given.—J CHOLAK *J Am Chem Soc*, 57 (1935), 104 (E B S)

Lipoid—Determination of Total, in Plant and Animal Tissues. Lipoids were extracted from various plant and animal tissues. Ether alcohol mixture gave too high a value, as the extract also contained carbohydrates and salts. Ether or petroleum ether too low, as phospholipins were left behind. The true amount was given by extracting with ether and alcohol for 30 minutes at 60° C and reextracting with petroleum ether.—J S CHEN *Chin J Physiol*, 8 (1934), 195, through *Physiol Abstracts*, 19 (1935), 563 (S W G)

Meat Extract and Yeast Extract—Suggested Test for Distinguishing between. About 10 Gm of the sample are digested in a mortar with 20 cc of 70 per cent acetone solution (in water). The yellow supernatant liquid is run off through a filter and the clear filtrate tested as follows. To 3 cc of the filtrate a few drops of strong bromine water are added, when darkening in color takes place. (If an excess of bromine be added the dark color vanishes and is not restored by reducing agents.) After standing for 5 minutes a dark red color is developed. Two cc chloroform are now added and the mixture is shaken. On separating the chloroform layer is colored deep reddish violet. This test was applied to commercial yeast extracts, and also to a specimen extract prepared in the laboratory from air-dried brewer's yeast. The same result was obtained in all cases. Many of the well known meat extracts were then submitted to the test, but none gave this reaction. The test gave good results for a mixture of yeast extract and meat

extract It is interesting to note that a similar acetone extract of egg-yolk gave this pink color with bromine, and also that of the fat free portion of cheese It would appear that the tryptophane grouping is free to react with the bromine in the above substances, with the exception of the meat extracts—R O BLENCH, *J Soc Chem Ind*, 54 (1935), 148 (E G V)

Mercury—Determination of, in Mercurial Ointment A tentative method was adopted The sample is digested with nitric acid (1:1), the aqueous extract removed and the residue washed The combined aqueous extracts are washed with ether and titrated with ammonium thiocyanate, (0.1N)—*J Assoc Official Agr Chem*, 18 (1935), 85 G S W

Morphine—New Colorimetric Method for Determining, and Its Derivatives The Folin and Malmros colorimetric method for determining glucose is modified so that it can be used for determining morphine and its derivatives The reduction of potassium ferricyanide is allowed to proceed at a lower pH The presence of potassium cyanide to accelerate the reaction is not necessary and the reduction proceeds at room temperature, the reduction reaches maximum values in about 5 hours Under these conditions reduction does not take place in derivatives of morphine in which the hydrogen of the phenolic group is substituted by side chains, alpha-monoacetylmorphine, which has a free phenolic group, gives the same values as morphine At a boiling temperature the reduction of potassium ferricyanide is influenced by other groups, and values for morphine are obtained which are exactly 3 times those obtained at room temperature At room temperature morphine in a concentration of 1:100,000 can be determined accurately The method is sensitive and reliable, a 0.151 per cent morphine hydrochloride solution gave 0.154 per cent by this method Other morphine derivatives can be determined if they have a free phenolic group, those in which the hydrogen is substituted by alcohol or acetyl chains can be assayed by introducing the phenolic group through splitting off the chains—G RIZZOTTI *Boll soc ital biol sper*, 9 (1934), 509, through *Chem Abstracts*, 29 (1935), 292

Nitrates—Determination of, in Tablets A tentative method was adopted Aliquots of a water solution are treated with saturated potassium chlorate Nitric acid (1:1) is added and, after standing, silver nitrate (0.1N) The solution is filtered and titrated with potassium thiocyanate solution Correction is made for chlorides if present—*J Assoc Official Agr Chem*, 18 (1935), 89 (G S W)

Pancreatin—Determination of Amylolytic Activity of The author finds that the reaction between pancreatin and starch should be continued for at least 1 hour The determination of amylolytic activity should be carried out at 37° C Higher temperatures give exceedingly low values—A DE CLERCQ *J pharm Belg*, 17 (1935), 95 (S W G)

Pepsin—Determination of Proteolytic Activity of The optimum acidity for the proteolytic digestion of coagulated egg albumin has been found by the authors to be at pH 1.3 Determinations of activity of pepsin or its preparations should be carried out at 37° C—A DE CLERCQ and M VAN HAUWAERT *J pharm Belg*, 17 (1935), 59 (S W G)

Perchlorates—Determination of Chlorates are quantitatively reduced in the cold by titanous chloride while perchlorates are not appreciably reduced in dilute aqueous solution, even on prolonged boiling The perchlorates are completely reduced, however, by a concentrated solution of titanous chloride in a fairly strong sulphuric acid solution—M L NICHOLS *Ind Eng Chem, Anal Ed*, 7 (1935), 39 (E G V)

Petroleum Products—Viscosity of The Saybolt viscometer is satisfactory for plant control work and for determining specifications of commercial petroleum products, but it is not sufficiently accurate for research purposes An improved Ostwald viscometer is described The following equation connects kinematic viscosity (KV) and Saybolt viscosities (S) above 5000 KV = 0.002042 S + 0.40—W B McCLUER and M R FENSKE *Ind Eng Chem* 27 (1935), 82 (E G V)

Podophyllum—Determination of A tentative method was adopted The drug is percolated with alcohol, 90% of the percolate is collected in one beaker, the remainder in a second beaker The contents of the first is evaporated to a small volume, poured into cold (10°) dilute hydrochloric (about 0.01N) and mixed with the contents of the second beaker After standing 12 hours in the cold, the precipitate is filtered in a Gooch crucible, dried and weighed—*J Assoc Official Agr Chem*, 18 (1935), 89 (G S W)

Potassium Dichromate—Standardization of A 1 Gm sample of arsenous oxide is treated with a little water, 1 Gm of sodium hydroxide is added, the mixture is warmed, and then 50 cc

of 5 normal sulphuric acid are added. Now slightly less than 1 Gm. of potassium dichromate is added, the solution is stirred, diluted to 400 cc., and allowed to stand for 5 minutes. Three drops of 0.025 molar *o*-phenanthroline ferrous complex, as indicator, and three drops of 0.01 molar osmium tetroxide, as catalyst, are added. The excess arsenous acid is back-titrated with 0.025 normal ceric sulphate, at the end point the rose color of the solution changes to a clear green.—H. H. WILLARD and P. YOUNG *Ind. Eng. Chem., Anal. Ed.*, 7 (1935), 57 (E. G. V.)

Potassium Iodide—Assay Process for Of samples of *Liquor Iodi Mitis* purchased under the Foods and Drugs Act which were satisfactory with regard to the proportion of iodine and potassium iodide only 50% were free from hydriodic acid. In the remainder the hydriodic acid present caused an increase in the iodate titration of 0.15 to 0.4 cc., corresponding to 0.02 to 0.07% of potassium iodide. When it is remembered that different workers can obtain identical results, an error of 0.4 cc. is much too high to pass without correction. All samples of *Liquor Iodi Fortis* and *Mitis* should be examined for the presence of hydriodic acid and the iodate titration corrected before the proportion of potassium iodide is calculated. To estimate the hydriodic acid, 10 cc. is titrated with sodium thiosulphate, phenolphthalein or methyl red added and the solution titrated with sodium hydroxide.

$\text{Ce } 0.1N \text{ NaOH used} \times 0.01279 \times 10 = \text{per cent HI}$

$\text{Ce } 0.1N \text{ NaOH used} \times 0.0166 \times 10 = \text{per cent KI}$ to be subtracted from that found by the official process

If check is required 10 cc. may be evaporated to dryness, treated with water and evaporated again, the process being repeated until only a faint brown color remains. After drying at 110° C. the residue is ignited at very low temperature for a moment or two. Potassium iodide only remains and may be estimated by iodate as usual.—M. HERD *Pharm. J.*, 134 (1935), 87 (W. B. B.)

***n*-Propylarsonic Acid—Use of, as a Reagent for the Determination of Zirconium** Zirconium chloride solution in not more than 10 per cent by volume of hydrochloric acid is heated to boiling and the zirconium precipitated with 25 cc. of a 5 per cent aqueous solution of *n*-propylarsonic acid. The mixture is boiled 2 or 3 minutes, cooled, filtered, the precipitate washed free from chlorides, ignited to constant weight and weighed as zirconium oxide. The presence of tin, thorium, manganese, nickel, iron, aluminum, vanadium, chromium, titanium, copper, cerium, magnesium, zinc, uranium, molybdenum, cobalt, beryllium and cadmium did not interfere. Antimony and bismuth did. Satisfactory results could not be obtained in concentrations of sulphuric acid above 4.5 per cent by volume. Allylarsonic acid, though tried, was not as satisfactory as *n*-propylarsonic acid.—F. W. ARNOLD, JR., and G. C. CHANDLER *J. Am. Chem. Soc.* 57 (1935), 8 (E. B. S.)

Quillaja Saponin—Colorimetric Test for An acid solution of sodium nitrite, followed by excess of alkali, was found to produce a yellow colored solution. The depth of color was found to be proportional to the amount of saponin present. One per cent solutions of saponins in distilled water were prepared and tested as follows. Ten cc. of these solutions of saponin were placed in Nessler glasses, graduated to 50 cc. One cc. of a 10% aqueous solution of sodium nitrite was added, followed by two drops of sulphuric acid, and after 30 seconds twenty cc. 1*N* sodium carbonate added. The colored solution was then made up to 50 cc. with distilled water. To prevent frothing a few drops of ether were carefully dropped on to the surface of the solution. The full color is not developed for about five minutes, and is then stable for several hours. As yet, it has not been found possible to use this test for the determination of saponin in quillaja bark, as interfering substances are extracted with the saponin. The addition of the reagent giving a very dark colored solution. No method has been found for purifying the saponin without loss. Preparations of senega root give a wine red color, therefore it is not impossible to detect added quillaja saponin in these. Phenols and other substances which give a reaction with the reagents used should not be present.—J. RAE *Pharm. J.*, 134 (1935), 59 (W. B. B.)

Quinine—Determination of, in Chocolate Tablets In contrast to the method of the Greek Pharmacopœia in which cacao butter is removed with ether and the pellets then treated with sodium hydroxide, chocolate tablets are first extracted for 3 hours with petroleum ether in a Soxhlet apparatus. Quinine tannates are less soluble in this than in ether. The residue is

dried and further extracted for 10 hours with alcohol. The alcoholic solution is evaporated, mixed with sodium hydroxide and extracted 3 times with ether. This ethereal extract is repeatedly washed with water, evaporated, dried with alcohol and the residue titrated with 0.1N hydrochloric acid with lacmoid indicator. Control analyses showed an error of 0.5-1.6 mg. of quinine in an original content of 60 mg.—A. JUSTINIANOS and J. PIERRA, *Praktika (Akad. Athenon)*, 8 (1933), 173, through *Chem. Abstracts*, 29 (1935), 543.

Quinine, Quinidine and Cupreine—New Color Reaction of, and Its Application to the Determination of Quinine. Quinine, the methyl ether of cupreine, is extracted by the usual solvents, from cinchona bark and purified from ether. The methyl group is removed by warming in a glycerin bath to 180° after adding sulphuric acid. Nitroaniline is added, diazotization is then carried out, 30 per cent sodium hydroxide is added, and finally sulphuric acid is added. A stable red orange precipitate is obtained which is soluble in 95 per cent alcohol. A similar reaction is produced by quinidine and cupreine. Cinchonine and cinchonidine do not give this reaction. **Quantitative determination of quinine.**—About 0.1 Gm. of drug accurately weighed and finely powdered is mixed with 0.2 Gm. of calcium oxide and 2 cc. of water. The mixture is digested on a water-bath. 5 cc. of chloroform are added, and then heated to boiling, filtered, the residue is digested again as above and filtered. The liquid is then evaporated and the residue is treated with 30 drops of sulphuric acid, then 2 cc. of water, warmed, then cooled and placed in a 10 cc. graduate. One cc. of this liquid is taken (contains alkaloids from 0.1 × 0.1 Gm. of drug used) and placed in a colorimetric tube and placed in a heated glycerin bath. A temperature of 180° is maintained for 5 minutes, then the tube is cooled and the contents placed in 2 cc. of water. Para-nitroaniline diazo compound is then added, stirred, alkalinized with 10 drops of 30 per cent sodium hydroxide and 10 drops of sulphuric acid is finally added. The product is dissolved in 2 cc. of 95 per cent alcohol and the orange solution is compared with a standard in a colorimeter. A modification of the method is given for tincture and fluidextract of cinchona.—J. A. SANCHEZ, *J. pharm. chim.*, 21 (1935), 24 (M. M. Z.)

Salts of Organic Acids—Assay Methods for. A method of assay for sodium benzoate and sodium salicylate, described by Henville in 1927, may be used as a general method. In this method the salt is titrated directly with standard acid in the presence of diethyl ether with methyl orange indicator. Consider a salt MA. $MA + HCl \longrightarrow MCl + HA$. The method is applicable where HA is sparingly soluble in water and readily soluble in some solvent immiscible with water, where HA is not too strong an acid, apparent dissociation constant less than 2.5×10^{-3} , where MOH is not too weak, apparent dissociation constant greater than 10^{-6} . It is applicable to ammonium benzoate and salicylate and other salicylates, to sodium barbital and sodium phenobarbital. Procedure and results are discussed.—R. M. HITCHENS, *J. Am. Pharm. Assoc.* 24 (1935) 11 (Z. M. C.)

Santonin—Determination of, in Mixtures. A tentative method was adopted. The sample in a Gooch crucible is washed with petroleum ether (saturated with santonin) and the washings discarded. Extraction is made with hot benzene, the extract evaporated to dryness, dissolved in alcohol and made up to volume. Aliquots are treated with dimnitrophenylhydrazine solution (1 Gm. of 2,4-dinitrophenylhydrazine in 90 cc. of water and 10 cc. of sulphuric acid), allowed to stand 48 hours in the dark, filtered, washed with alcohol, dried and weighed.—J. Assoc. Official Agr. Chem. 18 (1935) 87 (G. S. W.)

Sugar—Comparison of Reducing Sugar Methods. Results of determinations of invert sugar by the Allihn, Herzfeld and Munson and Walker methods indicate that the Herzfeld method is the most reliable for determination of invert sugar in raw sugars. The Lane and Eynon volumetric method, which is a tentative one, agreed well with the Herzfeld method.—F. W. ZERBAN, W. J. HUGHES and M. H. WILEY, *J. Assoc. Official Agr. Chem.* 18 (1935), 118 (G. S. W.)

Sweetening Agents—Microanalytical Studies of Synthetic. The authors describe a modification of their method for the detection of saccharin in beverages. A special stirring apparatus was devised which greatly accelerated the speed of diffusion from the aqueous to the ether layer. By organoleptic tests saccharin may be detected within one to three hours in concentrations of 0.00025 to 0.001 per cent. Fahlberg's method was applied to the quantitative determination of saccharin in beer. The saccharin is hydrolyzed by refluxing for two hours with 20 per cent sulphuric acid. After cooling the liquid is neutralized carefully with 30 per cent sodium hydroxide (carbonate free), excess base is added and the mixture is then shaken vigorously.

in a flask fitted with an overflow tube and distillation arm to absorb the carbon dioxide in the atmosphere of the flask. A distillation apparatus with ground glass connections is preferred, since the hydroxide splits off alkaline products from rubber stoppers. In the diagram, the overflow tube *A* is attached to a non-corrosive steel tube *B* of 4 mm internal cross section. The cooling portion is about 20 cm long. The metal tube is joined to the overflow tube by means of a rubber connection and the delivery end of the tube is connected by the same means to a hard glass capillary *C*. At the beginning of distillation the end of this tube is immersed in 15 cc. of water neutralized to methyl red and placed in a flask which is supported by two blocks. During distillation the flask is covered by a rubber plate weighted with a lead ring *D* through which is passed the glass capillary. *E* is a support for the apparatus. *F* a plate to protect the receiver from heat. Toward the end of distillation the receiver is lowered several centimeters so that the distillate drops into the receiver. If more than 2-3 mg of ammonia are thought to be present several cc of *N*/70 acid are placed in the receiver with the water, otherwise distilled water alone is used.

Saccharin Determination Apparatus

monium thiocyanate. As an optional method the precipitated silver chloride may be weighed — *J Assoc Official Agr Chem*, 18 (1935), 84 (G S W)

Theophylline—Quantitative Determination in Soluble Preparations Comparison of various methods of assay of theophylline showed that an argentimetric method gives too high and iodometric methods too low results. Only the methylation method of Self and Rankin (*Quart J Pharm and Pharmacol*, 4 (1931), 346 and B P 1932) was satisfactory, but a simpler procedure is described. Although theophylline is quite difficultly soluble in either chloroform or isopropyl alcohol, it is soluble (about 1 part in 24) in a mixture of 3 volumes of chloroform and 1 volume of isopropyl alcohol. An assay is devised using the solvent mixture for isolation. Extracting an acidified theophylline sodium-acetate solution gave too high results, the acetic acid interferes. This is avoided by evaporating away the acetic acid freed by sulphuric acid before extracting the purine. Assays are described as follows (1) *For theophylline sodium acetate* Four-tenths Gm of theophylline salt is mixed with 2.5 cc 2*N* sulphuric acid and 7.5 cc water in an evaporating dish and evaporated to dryness on the water-bath. Five cc of water are poured on the residue and evaporated then 2 cc more and evaporated. The residue is warmed with 5 cc

From one third to one half the original volume of liquid is collected and the distillate then titrated with *N*/70 acid, using methyl red as indicator. The error introduced by back titration with a base is eliminated. One cc of *N*/70 acid corresponds to 0.2 mg nitrogen to 2.616 mg free saccharin to 3.445 mg of the sodium salt containing two molecules of water of crystallization to 2.39 mg of the water free salt. The authors, by combining their diffusion method with that of Schmidt, were able to detect saccharin in a concentration of 0.0003 per cent. A sensitive test for salicylic acid, based upon the precipitation of bromo phenol by bromine vapor is also described — V STANEK and P PAVLAS *Mikrochem*, 16 (1935), 211 (L L M)

Tetrachlorethylene — Determination of, in Mixtures A tentative method was adopted. The sample is refluxed with sodium metal dispersed in xylene. Amyl alcohol is added during refluxing. The solution is cooled, acidified with nitric acid, extracted with water and 0.1*N* silver nitrate added to the filtered aqueous solution. The excess silver nitrate is titrated with 0.05*N* am

water and 0.5N sodium hydroxide added drop wise until methyl red (2 drops solution) changes color, then is evaporated to dryness. The residue is rubbed up cautiously into 30 cc of a mixture of 3 volumes chloroform and 1 volume isopropyl alcohol, added portion wise. The carefully poured off extract is filtered through a small filter into a separatory funnel where the extract is shaken with 5 cc of wash water, which is tapped away and then run into a tared flask. Extraction is repeated with two portions of solvent (20 cc, then 10 cc) which are washed with the same 5 cc of water used for the first washing. The combined extracts are evaporated to dryness on the water bath. To prevent spattering and bumping at the last, the flask is immersed in boiling water. The recovered solvent mixture may be rectified and used again. The residue, dried at 100° C to constant weight, is weighed. Multiplying by 1.100, the weight of anhydrous theophylline is converted to weight of crystalline theophylline. (2) *For aminophylline* (Euphylline) Three tenths Gm aminophylline are dissolved in 2 cc water in a small separatory funnel and N or 2N hydrochloric acid added until color change of methyl red (2 drops of solution). Then for one minute the solution is shaken with 25 cc of the solvent mixture described above, the tapped off extract filtered through a small filter into a tared flask. The extraction is repeated 3 times with 20 cc, 20 cc and 10 cc of solvent and the filtered extracts combined in the flask, evaporated to dryness on the water-bath, the residue dried to constant weight at 100° C. The conversion factor from anhydrous to crystalline theophylline is then applied. The titer of aminophylline gives the ethylenediamine content. The ethylenediamine hydrochloride is not dissolved by the solvent mixture. On drying aminophylline 3 days over calcium chloride, besides loss of water, 2.17% ethylenediamine is lost.—F REINERS *Dansk Tids Farm*, 9 (1935), 11 (C S L)

Titration Apparatus—Continuous Reading A simple inexpensive apparatus to be used as an aid in teaching electrometric titration is described. All parts except galvanometer and milliammeter can be purchased from a radio dealer. Graphite-platinum, tungsten-platinum and silicon carbide platinum electrode pairs are used instead of calomel half-cell platinum. Details of procedure are reported. The apparatus has been applied to the titration of some ferrous iron compounds of the U S P.—L H BALDINGER *J Am Pharm Assoc*, 24 (1935), 6 (Z M C)

Vitamin C—Titrimetric Assay of A review of the method of the Food and Drug Administration, U S Department of Agriculture.—B RÖNNMARK *Farm Revy*, 34 (1935), 126 (C S L)

Triethanolamine—Detection and Determination of In the analysis of creams in which the fatty base is incorporated in water, the material is saponified, evaporated to dryness with lime, and the residue extracted with boiling absolute alcohol. The alcoholic extract on evaporation, yields a viscous residue containing any triethanolamine, glycerol or ethylene glycol which may have been in the original material. It is shown that commercial triethanolamine gives with hydriodic acid a white crystalline substance having the formula $(CH_2OHCH_2)_3NHI$ containing 53.6 per cent of the base and having a melting point of 169° C. Details of the method are as follows: "An accurately weighed portion (about 0.5 Gm) of the viscous residue from the alcoholic extraction described above is evaporated to dryness with 0.5 cc of constant-boiling 57% hydriodic acid and 5 cc of water in a glass dish. The residue is stirred with 5 cc of pure isopropyl alcohol, transferred to a sintered glass crucible, and washed three times with 5 cc portions of the alcohol, the crystals being sucked as dry as possible after each washing. The crucible and contents are dried to constant weight at 100° C, and a correction of 1 mg for each cc of isopropyl alcohol used in the transfer and washing of the crystals is applied. The m.p. of the product (169° C) serves to identify triethanolamine. The weight obtained, multiplied by 0.536 gives the weight of triethanolamine present." The method was tried out on commercial triethanolamine alone and in the presence of glycerol and ethylene glycol with highly satisfactory results.—H R FLECK *Analyst*, 60 (1935), 77 (A H C)

TOXICOLOGICAL CHEMISTRY

Arsenic—Presence of, in Bismuth Preparations Arsenic determinations were made on 24 samples of bismuth preparations, arsenic was present in none in amount sufficient to cause symptoms.—*Arch Dermatol Syphilol*, 28 (1934), 841, through *Chem Abstracts*, 29 (1935) 290

PHARMACOGNOSY

VEGETABLE DRUGS

Aloe—Evaluation of A very comprehensive research has been made bearing on the chemical composition physiological action, qualitative, quantitative and physiological evaluation and an interesting account of the use of the crustacean daphnia as a biologic test animal The author's conclusions are that (1) the chemistry of aloes is by no means sufficiently cleared up to permit chemical evaluation, (2) Curacao aloes is strongest, (3) the residue, freed from all but about 2 per cent of aloin, is almost as active as Curacao aloes, (4) Aloin while less effective is more toxic particularly as it affects the kidneys, (5) and there is slightly increased activity in alkaline solutions on standing—A VIEHOEVER *Am J Pharm*, 107 (1935), 47 (R R F)

Artemisia—New Crystalline Principles from Indian In the course of the examination of a large number of *Artemisia* species, many of which were collected on the N W Frontier of India, but also many from both adjacent and distant territory two distinct crystalline principles differing from santonin, were isolated from certain of these species One of these crystalline principles was obtained by the ordinary method for the assay of santonin, which fact seemed to indicate some relationship between the two respective bodies, and for laboratory convenience it was named pseudo santonin Assay of further samples of *Artemisia* from another district on the N W Frontier yielded a crystalline principle quite distinct from either santonin or pseudo santonin, although in some respects much more closely resembling santonin For laboratory convenience this second new principle was provisionally named K-santonin to distinguish it from the pseudo santonin, and to indicate the district from which the material had been collected These two crystalline principles are quite distinct from artemisin, a crystalline principle separated from the mother liquors in working *Artemisia maritima* for santonin The following table conveniently classifies these various bodies

Properties	True Santonin	K-santonin	Pseudo santonin	Artemisin
PHYSICAL				
Melting point	172	210-218	184-186	200
Specific rotation	-172.5	-140	-172.5	-84.3
Sensitivity to light	Very sensitive	Much less sensitive	Insensitive	Less so than santonin
REACTIONS				
Alcoholic potash	Carmine red	Pale carmine red	Brownish yellow	Pale carmine red
Sulphuric acid cooled	No color	No color	Immediate dark brown	No color
SOLUBILITIES				
Alcohol (90%)	1-0.0	1-116	1-15	
Ether 0.720	1-140	1-025	1-312	
Chloroform	1-2.5	1-4.2	1-4.2	Forms a compound
Boiling water	1-416	1-590	1-45	1-60
Cold water	Almost insoluble	Almost insoluble	1-300	

Further chemical investigation reveals that the principle provisionally named K-santonin is a levo isomer of true santonin It shall henceforth bear the name of β santonin The research of pseudo santonin is still in progress—T SMITH and H SMITH *Pharm J*, 134 (1935), 3

(W B B)

Bixa Orellana L.—Analysis and Therapeutic Action of Ripe fruits weighing 12 to 18 Gm are composed of rind (22 per cent) pulp (68 per cent) and seeds (10 per cent) The rind contains ethereal oil (0.05 per cent), resin (1.0-1.65 per cent), tannins and cellulose The pulp consists of volatile substances (20-28 per cent), coloring matter known as orlean or annatto (4.0-5.5 per cent), various sugars including sucrose (3.5-5.2 per cent), ethereal oil, a trace of an unknown alkaloid, saponin and tannin The seed is composed of seed coat (18 per cent) containing waxes and ethereal oil, and of kernel (82 per cent) containing 8 to 11 per cent of fatty oils the constants of which closely resemble the fatty oils of *Raphanus sativus* L Therapeutically, the fruit pulp made into a maceration (2-3 per cent) or a decoction (1-2 per cent) is used for dysentery, a tincture or fluidextract of the seed coat is used as a tæniacide or in the obstinate constipation of swamp fever, a 1.25 per cent infusion of the whole seed is used in the treatment of asthma, for the prevention of night sweats in phthisis and for the prevention of mucous in the nasopharynx A kataplasm prepared from the unripe fruit is used as an emollient for leprosy while an evaporated alcoholic extract may be used in a manner similar to that of a mustard plaster A kataplasm prepared from the fresh leaves is also used as a mild rubefacient—F W FRIESE *Pharm Zentralbl*, 76 (1935), 4 (E V S)

Digitalis—Chemical Study of Sierra Nevada Crystalline digitalin in the leaves of Sierra Nevada digitalis was determined by the Perrot and Bourcet method (*C A*, 22 (1928) 2437), there was found 0.548 Gm per Kg of dried leaf, almost twice the quantity characteristic of commercial leaf. Analysis of leaves stabilized in the Vera Guiglieri apparatus (*Bol Univ Granada*, 4 (1932), 333) showed that only 1–20 of the glucoside remains in the drug —F. M. MARTIN and M. M. BROCAL *Anales soc españ fis quim*, 32 (1934), 838, cf Giral, *C A*, 28 (1934) 857 through *Chem Abstracts*, 29 (1935), 888.

Digitalis—Sardinian The leaves of *Digitalis purpurea*, var *tomentosa* from Sardinia contained 1.117 per cent (Gennargentu), 1.101 per cent (Limbara) and 1.080 per cent (Sassari) total glucosides as compared with 0.988 and 0.950 per cent for two commercial samples. The ratios of digitoxin, digitalin, digitonin, digitalin and digitalein were approximately the same for all samples —I. SIMON *Arch farmacol sper*, 58 (1934), 101, through *Chem Abstracts*, 29 (1935), 532.

Iris Versicolor L. and Iris Virginica L.—Methods of Identification of Rhizomes of Various species of iris are briefly discussed. Because of the importance of Florida as a source, attempt has been made to distinguish the rhizomes of the two most abundant species from *I. virginica* and *I. versicolor*. Eight characteristics were studied: Dimensions, color, fracture, comparison of stellar and cortical radial values, count of vascular bundles in cross section, dimensions of vascular bundles and parenchyma cells, and odor. The monograph on *I. versicolor*, N. F. V. is open to criticism because a single description is used to describe the drugs from two species which differ markedly in some ways. Separate descriptions with distinguishing points are given. The name *Iris caroliniana* should be replaced by *Iris virginica* because of its priority. In order to distinguish official from spurious species the monograph should have more specific histological data, especially vascular bundle counts and dimensions, stellar and cortical ratios, the color of the drug and color reaction with vanillin and hydrochloric acid —G. M. HOCKING *J Am Pharm Assoc* 24 (1935), 17 (Z. M. C.).

Labiatae—Tannin Content of The use of the *Labiatae* in folk medicine is probably due to their high tannin content, which varies from 5 to 23 per cent of the dry substance —H. VOLLMER *Arch expil Path Pharmacol* 176 (1934), 207, through *Chem Abstracts* 29 (1935), 883.

Liquorice Root—Report on, from Cyprus The unpeeled roots contained water (at 100°) 12.5, matter soluble in chloroform water 25.7, total ash 4.6 and acid-insoluble ash 0.3 per cent; the last two figures being on the moisture free basis —*Cyprus Agr J*, 29 (1934), 5, through *Chem Abstracts*, 29 (1935), 292.

Tephrosia Vogeli—Toxic Constituents of Seed Analysis of the kidney shaped black-brown seeds gave 39 per cent protein, 10.5 per cent fatty oil and 5 per cent ash. The acetone extract of seeds defatted with petroleum benzine is toxic to fish. Repeated fractional crystallization of the extractive afforded dehydrodeguelin, $C_{21}H_{20}O_6$, m. p., 232–233°, allo tephrosin $C_{21}H_{20}O_7$, m. p., 194–195°, and iso deguelin, $C_{21}H_{20}O_6$, m. p., 168°. The derivatives of these substances *viz.* dihydro dehydrodeguelic acid, deguelic acid and derric acid agree in properties with the findings of Clark (*J Am Chem Soc*, 53 (1931), 315, 731, 2370). Allo tephrosin is not identical with tephrosin or iso tephrosin although, by elimination of water, it yields dehydrodeguelin. Upon boiling with acetic anhydride, it gives a substance crystallizing in colorless needles, designated iso dehydrodeguelin (V).

Allo tephrosin contains one acetylizable hydroxyl group. The melting point of the acetyl derivative is raised during eight days standing in vacuum or in air from 120.5° to 180° without

the compound changing its composition. Acetylation of hydrogenated allo tephrosin gave $C_{23}H_{27}O_7 \cdot COCH_3$. Treatment of the acetyl derivative with *p* toluenesulphonic acid gave dihydro dehydrodeguelin, proving that hydrogenation occurs in the pyran ring. By oxidation of allo tephrosin with potassium permanganate a dicarboxylic acid, $C_{23}H_{22}O_{11}$, m p, 170° was obtained. Iso allo tephrosin, $C_{23}H_{27}O_7$, may be obtained by allowing allo tephrosin to stand for a day in methyl alcohol saturated with ammonia or by alkaline hydrolysis of acetyl allo tephrosin. Elimination of water from iso allo-tephrosin by sulphuric acid treatment yields iso dehydrodeguelin (V). Iso deguelin was isolated only in small quantity. It is optically inactive and reduces ammoniacal silver nitrate solution upon prolonged warming. It is isomeric with rotenone. The oxime melts at $233-234^\circ$. Reduction in acetic acid solution with platinum oxide catalyst gave dihydro desoxy-iso deguelin, $C_{23}H_{28}O_6$ (XII).

XII

In weak alkaline alcoholic solution, iso deguelin is converted in two days to iso allo tephrosin. The naturally occurring constituents of tephrosia seed undergo extensive modification under the influence of alkalis. Allo tephrosin does not occur as such in the seed, but is produced by the chemical treatment applied to the drug. It may be regarded as a relatively stable intermediate product of the oxidation of iso deguelin to iso allo tephrosin. All three substances isolated slowly cause paralysis of earth worms. Concentrations of from 1/100,000 to 1/110,000 produce in 7-8 hours an irreversible paralysis, except in the case of dehydrodeguelin. The effects produced on ascarids are less pronounced than on earth worms. *In vivo* vermifugal activity was not detected. The lethal dose of the crystalline mixture to mice was 0.01/20 Gm, the tolerated dose was 0.0066 to 0.007/20 Gm.—K. W. MERZ and G. SCHMIDT *Arch Pharm*, 273 (1935), 1 (L. L. M.)

Vehver Roots from Uganda. Steam distillation of the ground, pale yellowish brown roots, almost entirely free from rhizomes, yielded 1.8 per cent of a dark reddish brown, viscous oil of $d_{15}^{20} 1.0383$, $n_D^{20} 1.5248$, acid value 76.7 per cent and ester value 22.7 per cent. The oil was soluble in 1 volume of 80 per cent alcohol, but clouded on further addition of 80 per cent alcohol and did not become clear with a large excess of alcohol.—UGANDA PROTECTORATE *Ann Rept Dept Agr*, 1 (1933), 25, through *Chem Abstracts*, 29 (1935), 292.

Civet—Gathering of. A review.—M. G. GOUDERCHET *Drug and Cosmetic Ind*, 36 (1935), 27 (H. M. B.)

PHARMACY

GALENICAL

Chloral Suppositories—Note on the Preparation of. A review of the literature concerning the rectal administration of chloral in suppositories is given. The bases suggested for suppositories containing chloral are glycerin or cacao butter. The author reports that glycerin suppositories have been found unsatisfactory. The use of cacao butter alone as an excipient, using the fusion process, permits the incorporation of only 0.25 Gm of chloral hydrate per 4 Gm of suppositories in order to have the product melt at body temperature. Suppositories containing 33 per cent cacao butter and 66 per cent wax will retain 1 Gm of chloral hydrate per 4 Gm of suppositories, but they melt at a temperature above $45^\circ C$. The author suggests that a mixture

not exceeding 4 per cent of wax in cacao butter would be the most suitable proportion. To prepare such a suppository mixture, the medicament in the form of a fine powder is incorporated in about one-third of the cacao butter, then warmed to 40° C, the remainder of the cacao butter added, and when homogeneous, it is rapidly cooled.—C J RAVAUD *J pharm chim*, 21 (1935), 49 (M M Z)

Drug Extraction Processes—New The basic operations in modern drug extraction are (1) preparing and grinding of the drug, (2) extraction, (3) concentration and (4) solvent recovery. The various advances in carrying out these operations are discussed.—F CHILSON *Drug and Cosmetic Ind*, 36 (1935), 37, 109 (H M B)

Fats and Waxes—Heating of Williams shows how 22 different fats and waxes used in the manufacturing of cosmetic creams act under the application of heat and upon cooling. Observations show the importance of care in the cooling and melting of these products.—J M WILLIAMS *Drug and Cosmetic Ind*, 36 (1935) 33 (H M B)

Orange Juice—Browning of The browning of orange juice involves oxidation as a primary step. The primary products of oxidation then apparently undergo condensation reactions in which secondary reactions, probably amino acid-sugar reactions, occur. Interference with the formation of the primary products of oxidation by removal of oxygen or addition of reducing substances prevents browning. Sulphites and stannous salts are found to be of value in this regard. The addition of small quantities of sulphites or other antioxidants to pasteurized or benzoated juices or syrups preserves the color of such products. The reducing action of stannous salts, as well as the absence of oxygen in the canned orange juice, accounts for the fact that browning of canned juice does not occur either in plain tin or citrus enamel cans when stored at high or low temperatures. A large number of experimentally packed as well as commercially packed canned orange juices have been examined in the last four years without any browning having been found.—M A JOSLYN and G L MARSH *Ind Eng Chem*, 27 (1935), 186 (E G V)

Pharmaceutical Machinery The article gives a very complete review of modern machinery that is used in pharmaceutical manufacturing processes. The apparatus are described in detail and many illustrations are given.—*Chem and Drugg*, 122 (1935), 96 (T G W)

Steamer

Steamer—New Notes on Although the steaming of a solution at atmospheric pressure is not an official process for sterilization, it has been shown (*Quart J Pharm Pharmacol*, 7 (1934), 379-388) that many sterile solutions can be obtained by this simple procedure. That the method is reliable is supported by its inclusion in many foreign pharmacopoeias. The steamer is made of copper, weighs 4 1/2 lbs, and is about 14 inches high and 8 inches wide. It will easily stand on the ordinary laboratory tripod. On the inside of the steamer a small basket of perforated zinc carries the material to be sterilized. The capacity in terms of vessels commonly used for this purpose, is one 500-cc or two 100 cc or three 50 cc conical flasks or eight 25 or twelve 15-cc vaccine bottles. One of the outstanding features is the rapidity with which the water is raised to boiling. The sketch shows clearly the principles upon which the steamer has been designed.—H DAVIS *Pharm J*, 134 (1935) 116 (W B B)

Sterilization Notes The following formulas for injections, with directions for sterilization, are proposed for inclusion in the official formulary of the Chilean Association of Chemistry and Pharmacy. *Injectabilæ Adrenalinæ Chlorhydratis*—Adrenaline, 1 Gm, benzoic acid, 0.3 Gm, hydrochloric acid 0.1 N 90 cc, sodium chloride 8 Gm, recently distilled water, to 1000 cc

Sterilize by tyndallization at 70° for one hour on three successive days *Inject Chinini Iodobismutalis*—Quinine iodobismuthate, 10 Gm, guaracolated oil, 5%, to 100 cc An aseptic preparation *Inject Camphoræ Oleosum*—Camphor, 20 Gm, Olive oil, neutralized, to 100 cc Sterilize in a closed container at 115° for fifteen minutes *Inject Coffeini Compositum*—Caffeine, 20 Gm, sodium benzoate, 28 Gm, recently distilled water to 100 cc Sterilize at 115° for fifteen minutes *Inject Emetini Hydrochloridi*—Emetine hydrochloride, 4 Gm, sodium chloride, 0.58 Gm, recently distilled water, to 100 cc Sterilize at 100° for thirty minutes—ANONYMOUS *Pharm J*, 134 (1935) 58 (W B B)

Syrup of Hydriodic Acid, U S P X—Stabilization of The discoloration in syrup of hydriodic acid has been ascribed to decomposition of levulose, due to the fact that sucrose is rapidly hydrolyzed into dextrose and levulose So the syrup was prepared with hypophosphorous acid to prevent free iodine and dextrose instead of sucrose If dextrose of C P quality is used it gives the best preparation but even with commercial dextrose the stability was greatly increased—W J HUSA and L J KLOTZ *J Am Pharm Assoc*, 24 (1935), 45 (Z M C)

Tablet Manufacture The physical properties of good tablets are summarized The tablet formula is divided into (1) the active ingredients, (2) base or diluents, (3) disintegrator, (4) lubricant and (5) binder or excipients and each of these components are discussed The following processes in manufacture are tabulated (1) mixing and mulling of dry extracts and chemicals, (2) granulating (3) drying of granulations, (4) lubricating, (5) compressing and (6) coating and each is discussed—ANON *Drug and Cosmetic Ind*, 36 (1935), 35, 59 (H M B)

Wine—Effect of Cold and Freezing Storage on the Composition Results indicate a decrease in total tartaric acid, cream of tartar, extract and ash on cold storage This decrease was more pronounced when the wines were decanted and still more pronounced on longer storage Changes in alcohol volatile acid, nitrogen tannin and sugar are not significant—M A JOSLYN and G L MARSH *Ind Eng Chem*, 27 (1935), 33 (E G V)

PHARMACOPŒIAS AND FORMULARIES

Belgian Pharmacopœia IV—Some Remarks on A critical discussion of the monographs on chloretone morphine hydrochloride solid paraffin, phenacetyl, medicinal soap, sodium salicylate, strychnine nitrate and thiochromine, and the determination of iodine values for cod liver oil and linseed oil is given—C STAINER *J Pharm Belg*, 17 (1935), 79 (S W G)

Cod Liver Oil—Critique of 1934 Interim Revision of Text and Assays for U S P The author believes that provision should have been made for the addition of antioxidants to cod liver oil, to delay the onset of oxidation, in such amounts as would be definitely harmless Methods should have been included for the detection of sophistication by the addition of highly potent vitamin containing substances, such as halibut liver oil or viosterol Objection is taken that no specific diet for breeding experimental animals is included, and also that directions for grouping rats for the assay period are too complex It is apparently felt that the Hawk and Oser salt mixture should be used in the vitamin A test diet, thus eliminating the laborious "problem in stoichiometric—freshman chemistry" The Roentgenographic method for the determination of the degree of decalcification should have been included as optional Opportunity ought to be provided for public trial and criticism of the method before its official adoption—B L OSER *Ind Eng Chem* 27 (1935), 230 (The reply of E F Cook is given (*Ibid*, page 233) as well as a rebuttal by Oser) (E G V)

Homeopathic Pharmacopœia—German The second revised edition of the German Homeopathic Pharmacopœia will be ready for distribution March 31, 1936 A brief summary of the conditions existing before the recognition of the present pharmacopœia is given At present a Commission is working to unify the international standards for homeopathic pharmacopœias and to consider a standard nomenclature A few of the corrections of the text are taken up and some of the specifications of the pharmacopœia noted A method of capillary analysis of homeopathic tinctures sensitive to a dilution of D8 is described The method may be modified so as to be applicable to globules tablets and triturations The pharmacopœia contains about 1000 preparations considered in fairly common usage and an appendix containing about 500 more arranged in tabular form—K HAAS *Schweiz Apoth-Ztg*, 73 (1935), 29, 40 (M F W D)

Microchemistry—Rôle of, in Pharmacopœias At present very little microchemistry is employed in the testing of chemicals, although the German Pharm VI and the Swiss Pharm V do include a method of micro sublimation for testing one drug. The micro methods, while economizing on samples and reagents, in general require expensive and specialized apparatus and for this reason will probably not come into general use. The article includes a comparison of the macro- and microchemical methods for the identification of several anions, cations and compounds, which methods might easily be substituted for existing tests.—ROSENTHALER *Scientia Pharm*, 6 (1935), 7 (M F W D)

Pharmacopœia—London Hospital The previous edition of the London Hospital Pharmacopœia was published in 1925, and a comparison of this new volume with its predecessor shows that the main reason for the revision has been the publication of a new British Pharmacopœia. Apart from the B P innovations, there is very little that is new in the pharmaceutical contents of the book.—ANONYMOUS *Pharm J*, 134 (1935), 7 (W B B)

Shellac, B P C—a Criticism The author criticizes the monograph headed, "Lacca (Lac) Shellac," from the standpoint of accuracy of nomenclature used. He also criticizes the omission of *Acacia Catechu* and *Zizyphus Xylopyra*, while *Ficus religiosa* and *Shorea robusta* have been used and are only of minor importance. Other criticisms of this monograph are recorded.—E J PARRY *Chem and Drugg*, 122 (1935), 46 (T G W)

U S P Revision A summary of some of the proposed changes of the U S P Revision is given for the following: Concentration of Diluted Acids: Acidum Boricum, Aqua, Aqua Distillata, Arseni Iodidum, Barii Sulphas, Liquor Hydrogenii Dioxidii, Magma Magnesia, Pulvæ Ferri Carbonatis (Assay), Potassi Carbonas, Sodii Benzoas, Sodii Iodidum, Sodii Phosphas, Tinctura Ferri Chloridi.—ANONYMOUS *Pharm J*, 134 (1935), 90 (W B B)

NON OFFICIAL FORMULÆ

Chapping—Preparations for Ingredients and methods of manufacturing of soothing creams, ointments and lotions offered.—ANON *Drug and Cosmetic Ind*, 36 (1935) 145 (H M B)

Creams—Preparation of Cosmetic Problems in the production of cleansing, cold and tissue creams are discussed. Formulas are offered.—J M WILLIAMS *Drug and Cosmetic Ind*, 36 (1935), 143, 144, 146 (H M B)

Sinclair's Glue Sinclair's glue is an inexpensive adhesive used as a substitute for plaster in applying extension to fractured limbs. The original formula which still appears in the B P C 1934 contained two hygroscopic substances, glycerin and calcium chloride, to prevent excessive drying and brittleness in use. The present formula contains no calcium chloride because, experience has shown the calcium chloride reduced the adhesive properties. Two formulas for Sinclair's glue are now in use. Formula No 1 is "Very good" glue or gelatin, 50, water, 100, glycerin, 4 or 6, thymol or menthol, 0.15%. The smaller amount of glycerin is for summer or tropical use, and the larger amount for winter. Formula No 2 which is as follows is occasionally used: Isinglass 50, gelatin, 50, water 200, tannic acid, 12, glycerin 8 or more, thymol or menthol 0.15%. This second formula forms a stronger adhesive and is perhaps more elastic.—W A KNIGHT *Pharm J* 134 (1935), 7 (W B B)

DISPENSING

Incompatibilities—Ionic Reactions as the Cause of A table showing the insoluble products and their colors formed from cations and anions usually encountered in qualitative analysis is given.—A MOSER *Pharm Zentralh* 76 (1935) 33 (E V S)

Vehicles for Medicines—Study of IX Fruit Syrups Variableness in fruit syrups because of fermentation, to destroy pectin may explain their limited use. Extensive experimentation with degrees of temperature, avoiding exposure to air and other methods have been tried. The addition of 0.1 per cent benzoic acid to strained fruit juice and standing at room temperature until the filtered juice will remain clear when one-half its volume of alcohol is added, proved satisfactory. The presence of benzoic acid permits activity of the pectase but inhibits vinegar and other bacterial fermentation. Objections to use of benzoic acid are discussed. Three formulas are submitted: syrup of raspberry, syrup of strawherry and syrup of cherry. Syrup

of cherry has a higher flavor if the juice is in contact with the crushed stones for some time. Examples of their usefulness as vehicles are given.—B FANTUS, H A DYNIEWICZ and J M DYNIEWICZ *J Am Pharm Assoc*, 24 (1935), 46 (Z M C)

PHARMACEUTICAL HISTORY

Acacia Historical facts are recorded.—H G KELBLY *Drug and Cosmetic Ind*, 36 (1935), 97, 101 (H M B)

Calcium Lactophosphate Preparations—History of First suggested in 1869, calcium lactophosphate was introduced into U S P of 1880 and continued in subsequent issues until the tenth when it was dropped and incorporated into N F V. An elixir has been in each N F. An emulsion of cod liver oil with calcium lactophosphate enjoyed considerable popularity but has dropped out of use.—W J HUSA and A P McLEAN *J Am Pharm Assoc*, 24 (1935), 58 (Z M C)

History—Value of, in the Drug Store The author pleads for an interest in things historical and shows how the drug store may make use of historical exhibits. Colleges of pharmacy can collect historical material and can assist in interesting young pharmacists in the history of medicine and pharmacy.—F B KILMER *J Am Pharm Assoc*, 24 (1935), 55 (Z M C)

Maimonides—Medical Works of, and His Treatise on Personal Hygiene and Dietetics This year marks the octocentennial of the birth of this Hispano Jewish philosopher, theologian, physician and astronomer. Although his fame as a distinguished and the most rational physician of the Middle Ages is great, it is overshadowed by his reputation as a philosopher and Talmudist. Maimonides practiced medicine with religious fervor and his extensive medical knowledge was sought by the Court and general population alike. His medical writings were voluminous and covered the field quite comprehensively, for those days. He also is known for his works on diet and personal hygiene, poisons and their antidotes, special treatises on asthma and hemorrhoids. To some extent he championed science against the fundamentalism of the Bible, though he was at all times honest and consistent in the belief of the truth of the Aristotelian system and convinced of the truth of the Mosaic doctrine and of the Divine origin of the Torah. Though much can be said pro and con for this and other of his works, at least Maimonides must be credited with the fact that he pointed out that philosophy and science did not begin nor did it end in the Scriptures and Talmud.—L GERSHENFELD *Am J Pharm*, 107 (1935), 14 (R R F)

Pharmacy—History of, in the Netherlands This address by Dr Hk Cohen at the celebration of the 90th anniversary of the Rotterdam Department of the Netherlands Association for the Advancement of Pharmacy contains an excellent historical review of pharmacy in the Netherlands beginning with the guilds of the seventeenth century and continuing to the recent past. Historical sketches of many famous Dutch pharmacists: van Aelkeren, van der Schinne, Mulder, Fortuyn, Robertson, Grutterink, Nortier, Eshuyes, van der Burg, de Vrij and others, and their influence on pharmacy are included.—*Pharm Weekblad*, 72 (1935), 42 (E H W)

Urinalysis among the Ancients—The author describes the methods employed for the investigation of urine in diagnosis and prognosis among the ancients. Beginning with Hippocrates in the 5th century B C he carries his history through the middle ages.—M WAGENAAR *Pharm Weekblad*, 72 (1935), 124 (E H W)

PHARMACEUTICAL LEGISLATION

Legislation—Food and Drug Attention is directed to the position of the American Association of Colleges of Pharmacy in the matter of "sane, adequate revision of the Pure Food and Drug Act" and of its vote favoring "Senate Bill No 2800 or a measure of greater merit" at its convention last May. At a meeting of the National Drug Trade Conference, Dean DuMez set forth the position of the Association in a statement of the more important provisions which should be incorporated in any new legislations. These provisions are quoted in full.—E LITTLE *J Am Pharm Assoc*, 24 (1935), 61 (Z M C)

MISCELLANEOUS

Hospital Pharmacy Practice—Innovation in The author tells something of the work which led up to the publication of the Intern's Handbook, something about the book itself, information

as to pharmacy service and its regulations Procedure in issuing drugs is described and general pharmaceutical organization—J S MORDELL *J Am Pharm Assoc*, 24 (1935), 50

(Z M C)

Pharmaceutical Specialties—Necessity of Controlling A general discussion of the development of medicinal preparations is given, several official standards being mentioned In 1920 the government of Netherlands set up an official Institute for pharmacotherapeutic research which in the past few years has been hampered by reduced appropriations The work of the Institute, however, has shown the prevalence of untruthful advertising The Institute holds a monopoly on the manufacture of certain foreign specialties, tests medicaments not evaluated by physiological means, and sends monographs and other information to both pharmacists and physicians No one may use the name of the Institute in advertising without permission from it nor without compliance with the regulations set up by the Institute In 1932 the Swiss Society of Pharmacy organized a laboratory for the control of medicaments, which laboratory analyzes drugs chemicals and specialties A discussion of the American system of control of proprietaries is undertaken, enumerating the rules set down by the Council of the Am Med Assoc for recognition in New and Non official Remedies—L DAUTREBANDE and E ZUNZ *Schweiz Apoth-Ztg*, 73 (1935) 13, 25, 37

(M F W D)

PHARMACOLOGY, TOXICOLOGY AND THERAPEUTICS

PHARMACOLOGY

Alkylhydroxybenzenes—Anthelmintic Studies on I Alkylpolyhydroxybenzenes A series of alkylpolyhydroxybenzenes have been studied for their anthelmintic and toxicological actions Hexylresorcinol was especially studied Although this substance is toxic to cats, it is relatively non toxic to rats, dogs and man From extensive studies the authors conclude that hexylresorcinol is probably the best substance to be used against human ascaris and hookworm In amounts of 0.1 Gm per year of age up to an adult dose of one gram hexylresorcinol removes 90-100 per cent of the ascaris parasites It is somewhat less effective against hookworm—P D LAMSON, H W BROWN and C B WARD *J Pharmacol and Exper Therap*, 53 (1935), 198

(E C L M)

Alkylhydroxybenzenes—Anthelmintic Studies on II Ortho- and Para-*n*-alkylphenols This paper is a continuation of the systematic study of anthelmintics Of the several mentioned in this series *o*-*n* heptylphenol was found to produce no gross or microscopic lesions after an oral administration of 3-cc doses to dogs Upon man in doses four times as great as hexylresorcinol it removed 38% *Ascaris lumbricoides*, 58% *Necator americanus* and 32% *Trichuris trichiura*, compared with 90 to 100 per cent 70 to 80 per cent and 30 to 50 per cent removed by hexylresorcinol—P D LAMSON, *et al* *J Pharmacol and Exper Therap*, 53 (1935), 218

(E C L M)

Alkylhydroxybenzenes—Anthelmintic Studies on III 6-*n*-Alkyl-meta-cresols The complete series of 6 *n* alkyl-*m*-cresols from cresol through 6 *n* decyl *m* cresol was studied for their anthelmintic and toxicological properties both upon animals and man 6 *n*-Hexyl *m*-cresol is a less effective ascaricide than hexylresorcinol in man—P D LAMSON and H W BROWN *J Pharmacol and Exper Therap*, 53 (1935) 227

(E C L M)

Alkylhydroxybenzenes—Anthelmintic Studies on IV Isomerism in Polyalkylphenols This is a study of polyalkylphenols including their ascaricidal properties and local irritant effects No single substance reported in this paper shows combined properties of ascaricidal effect, toxicity and local irritant action which would indicate that it would be a more practical human ascaricide than hexylresorcinol—P D LAMSON *et al* *J Pharmacol and Exper Therap*, 53 (1935), 234

(E C L M)

Alkylhydroxybenzenes—Anthelmintic Studies on V Phenols with Other Than Normal Alkyl Side Chains A series of alkylphenols with other than normal alkyl side chains has been synthesized and studied for their ascaricidal properties None is as active ascaricidally as hexylresorcinol—P D LAMSON, *et al* *J Pharmacol and Exper Therap*, 53 (1935), 239

(E C L M)

Camphor—Comparison of Toxicity and General Actions of Natural and Synthetic, on Guinea Pig Samples of natural official dextrorotatory camphor and racemic synthetic camphor

were tested on guinea pigs of from 300 to 750 Gm. To overcome variations due to the animal, several sets of four each were taken for each dose. Warm solutions of camphor of about 10% were tested. Results showed synthetic camphor to be more toxic than natural camphor. The smallest dose causing death in the case of synthetic being 1.60 Gm, as compared to 1.90 Gm for the natural. Symptoms of intoxication were produced by 0.3 Gm of synthetic as compared to 0.7 Gm of natural. Although the symptoms of intoxication were of the same order, nevertheless, convulsions were more severe in the case of the synthetic camphor.—R. HAZARD and R. LARDÉ. *J. pharm. chim.*, 21 (1935), 97. (M. M. Z.)

Cinchophen and Tolsyn—Elimination of Uric Acid from Rats' Liver by Action of The maximal effect in decreasing the uric acid content in the livers of rats for phenylcinchoninic acid (cinchophen) and the ethylester of paramethylphenylcinchoninic acid (tolsyn) was about 0.01 Gm per Kg body weight orally daily. A noticeable effect on the output of uric acid was obtained by the administration of 0.0008 Gm daily. This corresponds to about 0.05 Gm for a seventy Kg human adult. When the amount of these drugs was increased to 0.02 Gm there was a slightly greater loss in body weight than for controls upon the same diet. A very severe loss of body weight to the extent of from 18% to 20% was noticed after the daily administration of 0.6 Gm of tolsyn or 0.2 Gm of cinchophen. Free phenylcinchoninic acid therefore proved to be far more toxic than the ester.—O. FÜRTH and E. EDEL. *J. Pharmacol. and Exper. Therap.*, 53 (1935), 105. (E. C. L. M.)

Croton Resin—I Toxicity Studies Using Goldfish The resin was isolated from the methanol extract of the croton berry by a modification of the process of Cherbuliez. The relative toxicities of croton oil, the alcohol soluble portion of the oil and croton resin were tested on gold fish. The resin is shown to be more toxic than rotenone.—J. R. SPIES. *J. Am. Chem. Soc.*, 57 (1935), 180. (E. B. S.)

Croton Resin—II Toxic and Vesicant Action of Certain of Its Derivatives Hydrogenation of croton resin with nickel and platinum reduced the iodine number from 53 to 38 but did not decrease the toxic or vesicant action. Bromination decreased these properties. Complete methylation of the hydroxyl group produced a physiologically inactive resin. Goldfish were used in the tests.—J. R. SPIES. *J. Am. Chem. Soc.* 57 (1935) 182. (E. B. S.)

Digitalis—Assay on Normal and Exsanguinated Cats It has been found that when digitalis preparations are assayed on a cat in which blood has been replaced by physiological saline, the lethal dose is smaller than that required for a normal cat. There seems to be indication that the active principles of digitalis may combine with the proteins of the blood to render them less potent but this has not yet been established.—D. I. MACINT. *J. Am. Pharm. Assoc.* 24 (1935) 15. (Z. M. C.)

Digitalis Lanata and D. Purpurea—Pharmacological Action of The activity of *D. lanata* is 25 per cent greater than that of *D. purpurea*. The activity is maintained for a year in carbon dioxide gas. The activity of *D. lanata* treated with chloroform and dried in hot air is less than when it is dried at room temperature.—A. RABBENO and O. MARINI. *Arch. int. Pharmacodyn.*, 48 (1934), 297, through *Physiol. Abstracts*, 19 (1935), 615.

Dinitrophenol—Metabolic Activity of Compounds Related to In summarizing their studies the authors conclude as follows: 1. Fifty compounds chemically related to 2,4-dinitrophenol have been tested for power to stimulate metabolism in rats, pigeons and dogs, using changes in body temperature as an index to the metabolic changes. 2. When either the hydroxyl or nitro groups of 2,4-dinitrophenol are modified by substitution with other groups or by change in position, the action of the compound as a metabolic stimulant is either greatly reduced or completely abolished. 3. Either active or inactive compounds may be produced by adding extra groups to the dinitrophenol molecule, or by introducing nitro groups into other cyclic compounds. 4. Picramic acid, dinitrohydroxydiphenyl and 2,6-dinitrophenol were found to produce increases in temperature, but only to small degrees. 5. 2,4-Dinitro- α -naphthol was found to be inactive in rats, but 25 per cent more toxic in pigeons, for a given degree of metabolic stimulation, than dinitrophenol. 6. Dinitro-*o*-cresol stimulated the metabolism of both rats and pigeons, but was three times as toxic in the former and 11 per cent more toxic in the latter than the dinitrophenol. 7. 2,4-Dinitro-*o*-cyclohexylphenol and the similar pentyl compound did not raise the temperature of rats. Both compounds were effective stimulants in pigeons, but despite claims of about 400 per cent greater activity and a lesser toxicity than dinitrophenol, they were found to

require about the same absolute dose as the latter drug for a given degree of response. Their toxicities were only 15 per cent and 4 per cent less, respectively, than the toxicity of dinitrophenol. 8 The relative values of these active compounds for human therapy must, therefore, be decided on the basis of their freedom from undesirable side actions, since the pharmacologic evidence is contradictory, or indicates insignificant differences between them. Some of the more important side actions cannot be tested for in animals, so that cautious clinical trials are indispensable.—M L TAINTER, F W BERGSTROM and W C CURTING *J Pharmacol and Exper Therap*, 53 (1935), 58 (E C L M)

Disinfectants—Tests for. References are made to the Chick-Martin and rat tail tests for disinfectants. The rat tail test is briefly described and the effectiveness of various disinfectants by this method is shown. The disinfectants tested included propyl alcohol, ethyl alcohol, iodine phenol, silver nitrate, corrosive sublimate, Dakin's solution, formaldehyde, phenosallyl, hydrogen peroxide and resorcin, all at various dilutions. Propyl alcohol ranked first in effectiveness and 70 per cent alcohol second. All the other disinfectants were good only in concentrations too high for daily use.—J CHRISTIANSEN *Lancet*, 1 (1935), 114 (B S R)

Ergot—Active Constituents and a Pharmacological and Chemical Study of. Reference is made to a series of ten reports published during 1929–1930, and some of the important conclusions. The investigations have been continued for the purpose of determining whether or not the oxytocic effects of purified alkaloids are the same as the crude extracts. Pregnant cats were used as test animals and details of the method are given. The activity of hydro alcoholic extracts, aqueous extracts and salts of ergotamine and ergotamine were compared pharmacologically and pharmacologically. Since anesthetics depress gastro intestinal function, the possibility that the small dose volume of the active principles might explain delayed action was studied. Tests indicated that absorption is chiefly from small intestine. The greatest sensitivity to orally administered ergot seemed to be just preceding, during and immediately after, labor. There was confirmation that commercial salts of ergotamine and ergotamine are not wholly representative of the action of the drug or its extracts. Further investigation of a new substance obtained in hydro alcoholic extracts was demonstrated. This hydro alcoholic percolate was handled very carefully and separated into a 'total alkaloid fraction' and an 'alkaloid-free fraction'. The latter tested pharmacologically was shown to have no significant uterine activity. The total alkaloid fraction tested pharmacologically was shown to contain all the significant characteristic uterine activity of ergot. It showed also that the isolated guinea pig uterus method is unreliable. General analysis of results leads the author to believe that crude extracts probably owe superior activity to an unidentified substance. This new substance behaves like an alkaloid and should be classed as a new member of the "total specific alkaloids of ergot"—M R THOMPSON *J Am Pharm Assoc* 25 (1935), 24 (Z M C)

Ergot—U S P Assay for. A note on the revision of the assay process for ergot and fluidextract of ergot, U S P. The revision was made during 1933, and became official in the United States on January 1, 1934. Ergotamine ethanesulphonate was adopted as the official ergot standard.—ANONYMOUS *Pharm J*, 134 (1935), 61 (W B B)

Ergotamine Tartrate—Effect of, on Cerebral Circulation of Man. The striking effect of ergotamine tartrate in the treatment of migraine lead the authors to investigate the physiological action of this drug upon human subjects with especial reference to its action on the intracranial circulation. The drug was given in doses from 0.25 to 0.5 mg intravenously to unanesthetized patients. In most cases the drug produced a moderate increase flow of blood through the brain. This increase was probably secondary to an increase in systemic blood pressure. These findings do not explain the relief of headache which follows the injection of this drug.—W G LENNOX, E L GIBBS and F A GIBBS *J Pharmacol and Exper Therap*, 53 (1935) 113 (E C L M)

Insulin—Quantitative Determination of, in Fluids, Tissues, etc. Seven methods for the quantitative determination of insulin are reviewed critically. The four methods approved are those of Fisher and Noble, Mauzeri, Baker, Dickens and Dodds, and Blades and Adams.—O KAUSCH *Pharm Ztg* 80 (1935), 33 (G E C)

Insulin Preparations—Standardization of. The first blood test after insulin injection is made after 1 hour and 30 minutes by the Toronto method. At that time, the blood sugar has passed through the minimum and is ascending again. It was found that the lowest level is obtained at 45 minutes. The quantities injected were 0.75 and 1.0 international unit per 2 Kg.

animal, calculated approximately and given intravenously. The dose was reduced or increased in accordance with the deviation weight from 2 Kg, this factor being avoided in the final calculation. It was found by comparison with an international standard, that this method gives perfect agreement with the Toronto method. The sugar was determined by the method of Hagedorn Jensen.—C. COLOMNI, M. LONG and A. TOSATTO. *Biochem Therap*, 21 (1934), 378, through *Chem Abstracts*, 29 (1935), 551.

Morphine and Dilaudid (Dihydromorphine Hydrochloride)—Comparative Study of Actions of, on Intact Small Intestine of Dog. The authors studied the effect of morphine and dilaudid upon the ileum and jejunum of dogs and found that the minimal effective intravenous dose for jejunal effect of dilaudid hydrochloride was about 0.0002 mg X Kg body weight while that of morphine sulphate was 0.002 mg. For the ileum 0.0003 mg of dilaudid hydrochloride and 0.003 mg of morphine sulphate was needed. In small and medium doses dilaudid hydrochloride was ten times as effective as morphine sulphate. Further comparisons of these drugs were made in varying doses upon the tonus and the amplitude and number of rhythmic contractions of the intestines under various conditions.—C. M. GRUNER and J. T. BRUNDAGE. *J Pharmacol and Exper Therap*, 53 (1935), 120 (E. C. L. M.)

Morphine, Codeine and Related Substances—Respiratory Effects of. III. Effect of Morphine, Dihydromorphine, Dihydromorphine (Dilaudid) and Dihydrocodeinone (Dioclid) on Respiratory Activity of Rabbit. Morphine, dihydromorphine, dilaudid and dioclid were given subcutaneously to rabbits and a comparison made as to the effectiveness of these compounds in decreasing the rabbits' respiratory rate, minute volume and sensitivity to stimulation by carbon dioxide. The minimum dose (per Kg body weight) of the base required to decrease the respiratory activity was found to be as follows: morphine 0.32, dihydromorphine 0.22 to 0.27, dilaudid 0.027 to 0.035 and dioclid 0.21 to 0.30.—C. I. WRIGHT and F. A. BARBOUR. *J Pharmacol and Exper Therap*, 53 (1935), 34 (E. C. L. M.)

Sunburn Preventives—Standard for, and a Method of Testing. Using the reaction of the skin as an indicator a definite reading may be obtained as to how the product concerned will protect the skin and to what degree. The author uses the method based on this reaction, known as "Erythema Reaction". The anterior portion of the forearm is exposed to a 550 watt quartz mercury lamp for twenty minutes. For best results the burner itself should be horizontal and not less than 3 inches long corresponding exactly with the length of the field being radiated. The method for the evaluations of results is given in detail.—L. STAMBOVSKY. *Perf and Ess Oil Rec*, 26 (1935), 3 (A. C. DeD.)

Vitamin A—Determination of, Values by Method of Single Feedings. The potency of samples of carotene, cod liver oil, kale and calf liver as sources of vitamin A was tested on rats depleted of vitamin A by feeding a single dose and observing the effect on growth and survival time. This method was found to give quite as reliable results as the more laborious method of daily feeding. It has the advantage of eliminating the possibility of deterioration of the activity of the preparation being tested during the course of the assay.—H. C. SHERMAN and E. N. TONHUNTER. *J Nutrit*, 8 (1934), 347, through *Physiol Abstracts*, 19 (1935), 589.

Yeasts—Quantitative Determination of Biologic Value of Medicinal. Methods for determining the activities of medicinal yeasts are critically reviewed. Standardization of yeast products is urged and requirements to be met are suggested.—A. J. J. VAN DE VELDE. *J Pharm Belg*, 17 (1935), 1, 21 (S. W. G.)

TOXICOLOGY

Amidopyrin—Agranulocytosis. Due to. Both experimental and clinical evidence is reported. Amidopyrin in therapeutic doses produces a marked fall in the granulocyte and other blood cell counts of sensitive individuals. This action takes place in one to two hours. At present it is not known whether an allergic condition is developed or whether certain individuals are permanently hypersensitive or are merely hypersensitive at certain periods according to unknown conditions such as hormonal unbalance or absorption of toxins. A number of case records are reported. The greatest frequency of the disease was found in the age group of 40-49 years in women and 60-69 years in men in seventy four reported cases.—P. PLUM. *Lancet*, 1 (1935), 14 (B. S. R.)

Antidotes—I General Plan The literature is being searched for information about poisons and their antidotes and laboratory studies are being made—J C MUNCH and F E GARLOUGH *J Am Pharm Assoc*, 24 (1935), 38 (Z M C)

Chromium Compounds—Toxicological Study of Some The author reports that injections under the skin of potassium bichromate cause the formation of lesions, which is due to the causticity of the compound. Small doses produced abscesses. A thorough study of the action of chromic chloride, potassium chromate and potassium bichromate was made. The action of these compounds is chiefly through the production of lesions in the skin and changes in respiration with perforations of the nasal septum. Symptoms produced in dogs and rabbits, and the amount of chromium recovered from the various organs of the animals are recorded. When bichromate is absorbed only slightly, hemorrhage occurs, and changes in respiration are observed. Chromic chloride is less toxic than the chromate or bichromate. Small doses of bichromate produced death in 2 days in the case of dogs. The author concluded that absorption in small doses of chromium compounds was definitely toxic—D BRARD *J pharm chim*, 20 (1934), 549, 21 (1935), 5 (M M Z)

Cinchophen Poisoning The author states that with proper precautions cinchophen can be taken safely. He advises taking the drug after meals with sodium bicarbonate and water. In cases where idiosyncrasies to cinchophen exist, gastric disturbance and loss of appetite are symptoms of intolerance. The drug should not be given for more than three days in succession each week unless tolerance is established. The author rarely gives cinchophen if the blood uric acid is below 4 mg per cent, since he believes that this provides an additional margin of safety. A case is cited in which a woman had taken cinchophen almost continuously for 12 years, with one dose being more than she could tolerate during the period. The administration of cinchophen was stopped until the woman recovered and then was continued with no harm to the liver—G EVANS *Brit Med J*, 1 (1935), 35 (S W G)

Codeine Addiction Three cases of codeine addiction in which withdrawal symptoms were noted after removal of the drug are reported. In two of the cases paregoric and morphine had been taken previously, but the period of time intervening should eliminate the possibility of crossed tolerance. The third case had no previous history of drug taking—D SLIGHT *Can Med Assoc J*, 32 (1935), 69 (S W G)

Emetine—Toxic Effects of Despite all precautions, emetine used in the treatment of amebiasis produced untoward effects. Emetine attacks all tissues and is therefore a general protoplasmic poison, changes in the kidney, liver, heart and skeletal muscles are identical, all showing hyperemia, cloudy swelling and degeneration of the cells. The immediate toxic dose for human adults is not known. Fatal results are to be feared with doses of 0.6 Gm, anything over 1.2 Gm is probably immediately fatal. When a therapeutic dose is injected, there is no general disturbance or gastro intestinal symptoms, local reaction is usually slight when the solution is neutral. Larger doses cause nausea, vomiting and diarrhea. These symptoms are also apparent with small repeated doses, which may also cause vertigo, extreme muscular weakness and expiratory dyspnea, the pulse rate is slow at first and then rapid. Death results from exhaustion, gastroenteritis or inter-current inflammation of the lungs. Among the serious symptoms are increased pulse-rate, listlessness and cardiac and mental depression. There may be leg weakness, muscular tremors, globus hystericus, cardiac arrhythmia, low blood pressure, edema, petechial hemorrhage, purpuric skin rash, hemoptysis signs of cerebral edema, albuminuria, polyneuritis, difficulty in swallowing and a feeling of constriction in the throat and chest. Recent investigation indicates that the drug is not a causative factor in abortion. It is generally advisable not to give the drug during menstruation—R N CHOPRA *Indian Med Gaz* (June 1934), through *J Trop Med Hyg* 38 (1935), 15

Lead—Biochemical Behavior in Body A review of pertinent literature covering the last 10 years. The absorption, mode of transport in the blood, sites of deposition or accumulation, influence upon bone metabolism and structure, and mode and rate of excretion of lead are presented—J C AUB *J Am Med Assoc*, 104 (1935) 87 (M R T)

Lead—Normal Absorption and Excretion of By suitable analysis of the food consumed and the excreta (urine and feces) of nine normal humans the daily normal lead intake was approximately 0.25 mg and the amount excreted daily was within the limits of experimental error, the same. Cumulative effects consequently do not normally occur. Chemical methods for the

determination of lead in human excreta and blood were found to yield uniformly low results, when these results were compared with those obtained spectrographically—R A KEHOE *J Am Med Assoc*, 104 (1935), 90 (M R T)

Lead Poisoning—Control of, in Workers The author presents 'a clinically proved and detailed method for the control of lead poisoning in the worker at work,' based upon extensive experience with industrial lead poisoning—E L BELNAP *J Am Med Assoc*, 104 (1935), 205 (M R T)

Lead Poisoning—Epidemiology of A discussion of the sources and prevalence of lead poisoning in humans—A J LANZA *J Am Med Assoc*, 104 (1935) 85 (M R T)

Mussel Poison—Chemistry and Toxicity of The author describes a method for the isolation of mussel poison and gives some chemical characteristics of the purified product. He found that the most poisonous preparation obtained killed mice in amounts of 1.7 gamma per gram body weight upon intraperitoneal injection. Mussel poison seems to be of a basic nature and of a relative small molecular weight. It does not give any of the color tests for alkaloids. Brieger's "Mytilotoxin" does not represent the pure toxic principle of poisonous mussels—H MÜLLER *J Pharmacol and Exper Therap*, 53 (1935), 67 (E C L M)

Phenolphthalein—Accidental Overdose in a Child without Ill Effects—A single case is reported in which a 3½ year old boy consumed orally 48 two grain chocolate tablets of phenolphthalein. Although the child appeared perfectly well, the mother gave an enema, following this, the bowels moved at half hour intervals, 5 in all. Child then taken to hospital, where he vomited several times and had two more bowel movements soon after admission. No blood in stool. Temperature and pulse good. Urine passed in normal amounts and was free from albumin, sugar, casts or blood. No tests were made for phenolphthalein in the urine or faeces but the vomitus showed a few pieces of the tablets. Complete recovery from the 96 grain dose was otherwise apparently uneventful. In the absence of information as to the amount expelled in the faeces and vomiting, the amount actually absorbed could not be estimated, and hence, the information yielded by the case is of limited value as far as the toxicity of phenolphthalein is concerned—W SACHS *J Am Med Assoc* 104 (1935), 45 (M R T)

Plumbism—Recent Progress in the Treatment of Patients suffering from chronic or subacute plumbism were 'de leaded' by the feeding of low calcium high-phosphorous diets, the excretion rate being determined by urine and fecal lead. Ammonium chloride, sodium phosphate or magnesium sulphate was employed to assist excretion. The procedure was found to be effective in controlling chronic plumbism or in bringing about rapid recovery from subacute plumbism—I GRAY *J Am Med Assoc*, 104 (1935), 200 (M R T)

Plumbism—Symptoms in Early Stages of Industrial A review of the literature with discussion, with emphasis upon symptomatology valuable for early diagnosis of industrial lead poisoning—R R JONES *J Am Med Assoc*, 104 (1935) 195 (M R T)

Somnifen Poisoning—Acute The symptoms of acute poisoning with somnifen resemble those of the barbituric derivatives in general with a special action on the temperature regulating centre, causing an abrupt rise and fall of temperature. Somnifen is less toxic than veronal, and eoramine is an effective antidote—H GLATZEL and F SCHMITT *Arch exp Path Pharmacol*, 174 (1934), 111, through *Physiol Abstracts*, 19 (1935), 680

(To be continued)

LEGAL AND LEGISLATIVE — *Concluded from page 254*

NARCOTIC RULES FOR VIRGIN ISLANDS REVISED

An executive order by the President has promulgated revised rules governing narcotics in the Virgin Islands. Narcotics must be obtained from qualified manufacturers or wholesalers in the continental United States. The regulations that apply follow:

Article 81 Orders—Who May Fill—An order for narcotic drugs submitted by a qualified dealer or practitioner in the Virgin Islands in accordance with the terms of the executive order may be filled only by a person duly registered, in the continental United States, in Classes 1 or 2 under Section 1 of the Harrison narcotic law, as amended, and regulations issued thereunder, except that an order for only such preparations and remedies as are considered exempt under Section 6 of said law and regulations issued thereunder may be filled by a person duly registered, in the continental United States, in Class 5 under Section 1 of said law and regulations.

Article 82 Record and Report of Sales—Each sale or other disposition of narcotic drugs under the executive order shall be recorded and reported as a domestic sale, and the person filling any such order for narcotic drugs shall enter upon form 810b or 811b as the case may be, of his monthly return the date upon which the order was approved by the commissioner of health of the Virgin Islands, in lieu of and in the space provided for the date of the purchaser's official order form. The column headed "Serial number" should be used for inserting the date of receipt of the purchaser's approved order. The columns headed "Registry number," "Class" and "District" will be left blank. If the order covers items of preparations or remedies which are considered exempt under Section 6 of said law and regulations, such items will not be reported in the monthly return, but the person filling the order for such items shall keep a record in the same manner as in the case of a domestic sale thereof, except that in lieu of the record required to be kept of the registry number of the purchaser there shall be kept a record of the date upon which the order was approved by the commissioner of health of the Virgin Islands and the date when the order was received by the person in the continental United States

filing the order—From *Oil, Paint and Drug Reporter*, Feb 18, 1935

CALIFORNIA

HYDROGEN PEROXIDE A DRUG OR MEDICINE

A manager of a pharmacy was charged with violating Section 13 of the California pharmacy practice act in that he permitted named persons, who were not registered pharmacists or assistant pharmacists to sell peroxide of hydrogen. He was found guilty in the trial court and appealed to the appellate department, superior court, Los Angeles County, California.

Section 13 of the pharmacy practice act makes it unlawful for any "proprietor" of a pharmacy to permit the sales of drugs, medicines or poisons by anyone except a registered pharmacist or assistant pharmacist. The defendant contended that since he was not a "proprietor" but a "manager," his conviction was unwarranted. The superior court held however, that a mere statement in the charge that the facts alleged constituted a violation of one section of the pharmacy practice act did not prevent the court from upholding the conviction if the acts charged were prohibited by any other section.

The defendant also argued that peroxide of hydrogen is not a drug or medicine within the meaning of the pharmacy practice act. We are satisfied, said the court, that "drug or medicine" are broad enough to include peroxide of hydrogen. It is a well-known chemical substance, listed in the United States Pharmacopœia and described in all encyclopedias.

The court stated that there "may be some difficulty in applying the pharmacy practice act to substances which have both a medical and a non medical use," but in the case of peroxide of hydrogen we are aided by the provisions of Section 16, of the act, which provides, by way of exception to the general provision of the act, that permits may be issued for the sale by unregistered persons in the rural districts of "simple household remedies and drugs," among which is listed peroxide of hydrogen. Such an exception gives rise to a strong implication that if excepted would otherwise have been within the purview of the act.

The judgment of conviction was affirmed. *People vs Arthur (Calif)*, 32 P (2d) 1002—Through *Journal A M A*

NATIONAL TUBERCULOSIS ASSOCIATION

As the major educational effort of the affiliated tuberculosis associations of the United States during 1935 will launch an Early Diagnosis Campaign on April 1st Under the slogan "Fight Tuberculosis with Modern Weapons" the need will be emphasized for prompt treatment of tuberculosis when a case is discovered and shall endeavor to familiarize the public with improvements in treatment during recent years that have greatly increased the chances for cure

NOTICE TO CONTRIBUTORS TO THE JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION.

The following notice has been prepared from comments received from members of the Board of Review of Papers and of the Publication Committee

Manuscripts should be sent to Editor E. G. Loberle, 2215 Constitution Ave., N. W., Washington, D. C.

All manuscripts should be typewritten in double spacing on one side of paper 8½ x 11 inches, and should be mailed in a flat package—not rolled. The original (not carbon) copy should be sent. The original drawings, not photographs of drawings, should accompany the manuscript. Authors should indicate on the manuscript the approximate position of text figures. All drawings should be marked with the author's name and address.

A condensed title running page headline, not to exceed thirty-five letters, should be given on a separate sheet and placed at the beginning of each article.

The method of stating the laboratory in which the work is done should be uniform and placed as a footnote at end of first page, giving Department, School or College. The date when received for publication should be given.

Numerals are used for figures for all definite weights, measurements, percentages, and degrees of temperature (for example 2 Kg, 1 inch, 20.5 cc, 300° C). Spell out all indefinite and approximate periods of time and other numerals which are used in a general manner (for example one hundred years ago, about two and one half hours, seven times).

Standard abbreviations should be used whenever weights and measures are given in the metric system, e. g., 10 Kg, 2.25 cc, etc. The forms to be used are cc, Kg, mg, mm, L, and Ml.

Figures should be numbered from 1 up, beginning with the text figures (line engravings are always treated as text-figures and should be designed as such) and continuing through the plates. The reduction desired should be clearly indicated on the margin of the drawing. All drawings should be made with India ink, preferably on white tracing paper or cloth. If coordinate paper is used, a blue lined paper must be chosen. Usually it is desirable to ink in the large squares so that the curves can be more easily read. Lettering should be plain and large enough to reproduce well when the drawing is reduced to the width of a printed page (usually about 4 inches). Photographs intended for half tone reproduction should be securely mounted with colorless paste.

"Figure" should be spelled out at the beginning of a sentence, elsewhere it is abbreviated to "Fig.," per cent—2 words.

The expense for a limited number of figures and plates will be borne by the JOURNAL, expense for cuts in excess of this number must be defrayed by the author.

References to the literature cited should be grouped at the end of the manuscript under the *References*. The citations should be numbered consecutively in the order of their appearance (their location in the text should be indicated by full sized figures included in parentheses). The sequence followed in the citations should be Author's name (with initials), name of publication, volume number, page number and the date in parentheses. Abbreviations for journals should conform to the style of *Chemical Abstracts*, published by the American Chemical Society.

(1) Author, A. Y., *Am. J. Physiol.*, 79, 289 (1927).

Papers presented at the Sections of the AMERICAN PHARMACEUTICAL ASSOCIATION's annual meeting become the property of the Association and may at the discretion of the Editor be published in the JOURNAL. Papers presented at these Sections may be published in other periodicals only after the release of the papers by the Board of Review of Papers of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The Editor will appreciate comments from Board of Review and Committee on Publication members, authors and others interested.

NATIONAL PHARMACY WEEK

The eleventh annual observance of the National Pharmacy Week movement will be held during the week of October 21st. It has been advisable to change the date to two weeks later than in previous years so as to allow the colleges of pharmacy greater opportunity to participate. In the past very little time elapsed between the opening dates of the scholastic year and Pharmacy Week.

The tenth annual observance for the year 1934 was more widely participated in by retail pharmacists than for many years. The office of the National Pharmacy Week Executive Committee was flooded with requests for copies of the human interest appeal stories. It is gratifying to note that many pharmacists are utilizing materials of this kind throughout the entire year by arranging for presentation of these talks before various community organizations.

An outstanding event of the 1934 observance was the splendid radio address delivered by President Robert P. Fischelis, of the AMERICAN PHARMACEUTICAL ASSOCIATION, over a nationwide hookup. Radio addresses were delivered by retail pharmacists and educators in many sections of the country.

The Robert J. Ruth Memorial Trophy, a silver loving cup donated by the Federal Wholesale Druggists' Association, through Secretary Lee Williamson has been awarded to Apothecaries Hall, New Haven, Connecticut. The 1934 National Pharmacy Week Window Display Contest Committee was composed of leading members of the Drug Trade Industry of New Orleans, with Professor John McCloskey serving as chairman.

The National Pharmacy Week movement is now entering upon its second decade of life which speaks well for those who have been responsible for the success of same. It has gone forward for a decade growing in strength year by year and has been kept within the tenets and precepts of the ideals as laid down by its founder. Throughout the country retail pharmacists are devoting more thought and attention to the professional aspects of their daily activities which no doubt is due in a large measure to the activities of the Pharmacy Week movement.

The National Pharmacy Week Executive Committee is now at work on the plans for the 1935 observance which beyond a doubt will prove to add another mile-stone to the success of a movement that has done much for the profession of pharmacy in bringing its message to members of allied professions and to the laity.

The National Pharmacy Week Executive Committee urges retail pharmacists to begin planning now for the professional window display that they are contemplating featuring during the week of October 21st. An attractive and interesting professional window display requires of the pharmacist a review of the literature of the subject selected, followed in turn by preparation of well worded copy for show-cards, assembling of materials and, finally, the arrangement in a dramatic manner.

Pharmacy as a profession is replete with romance and many great achievements in its interesting history and it is hoped that thousands of retail pharmacists will browse through the dust laden archives and bring to light many of these interesting stories by means of professional window displays and talks before various community organizations.

WILLIS G GREGORY

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIV

APRIL, 1935

No 4

WILLIS G GREGORY

Willis George Gregory is concluding his 50th year of membership in the AMERICAN PHARMACEUTICAL ASSOCIATION. He was chairman of the first and second editions of the Pharmaceutical Syllabus, prepared by the National Pharmaceutical Syllabus Committee, he is the senior pharmacy dean of the American schools of pharmacy, and for 20 years he has been a member of the New York State Pharmacy Council in the State Education Department. He was a member of the Revision Committee of the United States Pharmacopoeia, 1890-1920, a former president of New York State Pharmaceutical Association of which he is a life member, and for 33 years has been a member of the New York State Board of Pharmacy. When the AMERICAN PHARMACEUTICAL ASSOCIATION met in Buffalo, in 1924, Professor Gregory served as local secretary.

Willis G. Gregory was born April 19, 1857, the son of Willis Lathrop and Frances (Beach) Gregory, the seventh generation from John Beach ("Ye Pilgrim") of New Haven, Conn. He received his early education in Buffalo, the degree of M.D. from the University of Buffalo, in 1882, and graduated in pharmacy in 1886. Professor Gregory became a member of the pharmacy faculty, University of Buffalo, in 1886, and was elected dean in 1890, which office he still holds.

The subject of this brief sketch entered pharmacy in 1869 as apprentice in the pharmacy of his father, became a partner and, in 1887, proprietor until he retired in 1912. He has been active in local and state pharmaceutical organizations, is a member of the American Association of University Professors and of the Council (Trustees) of the University of Buffalo.

Dr. Gregory married Gertrude Fargo, of Buffalo, April 14, 1885, they had four children, two of whom are living—Louise, born 1890, and Frances, born 1901.

EDITORIAL

SIXTH INTERNATIONAL CONGRESS OF MILITARY MEDICINE AND PHARMACY

THE report of Commander William Seaman Bainbridge for the delegation from the United States has been issued in book form as Conference Series No 12 of the Department of State, the Foreword is by the Surgeon General of the U S Army, Robert U Patterson

Among the contributors to the Congress were Carlo Gorreta, Major Pharmacist-Chemist, Italy, Pharmacist-Colonel Morreau and Pharmacist-Commandant Raynaud, France, Jules Thomann, Colonel-Pharmacist of the Swiss Armies, Switzerland Among the official delegates holding military titles and positions as pharmacists were I Etienne and W Proot, Belgium, G H Barthet, F Chaput, A Saint-Sernin, France, S Krupinski, Poland, Guerrero Rafael Roldan, Spain, J Thomann, Switzerland Other officers were present but not distinctively mentioned as pharmacists

Among the conclusions unanimously adopted were "The training of the military medical officer and pharmacist must embrace the medical or pharmaceutical science and military instruction The training of military medical officers and pharmacists must be entrusted to the civilian faculties It is desirable that throughout their career, military medical officers and pharmacists should attend courses of instruction in both professional and military subjects "

Military-Pharmacist, First Class, L J Rochner, of the Netherlands, contributed a paper on the preparation and storage of medicinal ampuls Chief Pharmacist, Colonel G Grintzesso and Captain J Bibeseo, Rumania, made a report based on a selection of the most practical, expeditious and reliable methods for the preparation of injection solutions Chief Pharmacist-Chemist, First Class, A Saint Sernin, France, contributed a tabulation of twenty-one medicinal ampuls in use in the French Navy, with data on their mode of sterilization and the length of time of their preservation, ranging from six months to three years Pharmacist-Colonel Morreau and Pharmacist-Commandant Raynaud, France, reported on the preparation and preservation of medicinal ampuls in use in the service of the Armies on land and sea Chemist-Pharmacist Colonel Filippo Suzzi, Italy, briefly summarized the contributions made during about thirty years by the Italian Military Medical Service, through its investigations, methods and appliances of the many problems of pharmaceutical technique, with respect to the preparation and preservation of medicinal agents for hypodermic use, and with special reference to studies along the line of composition of the glass for the flasks Major Pharmacist-Chemist Carlo Gorreta, Italy, gave a résumé on the preparation and preservation of ampuls in use by the Auxiliary Service of the Armies and Navies Colonel Thomann, Pharmacist-in-Chief in the Swiss Army, reported on the preparation and preservation of ampuls and fluids for injection

These comments are of necessity very brief, the reports and papers go into careful detail and testify to an essential service by pharmacists in the armies and navies which, unless reported, fail to receive proper credit

The Eighth International Congress of Military Medicine and Pharmacy will be held in Brussels, June 27th to July 3rd

HOSPITAL DISTRIBUTION AND HOSPITAL SERVICE

THE issue of the *Journal of the American Medical Association* for March 30th is the annual Hospital Number—always an informative publication, the issue of this year presents the report more comprehensively and represents a most valuable service of the Council on Medical Education and Hospitals. The maps give what may be termed a bird's-eye view of the hospital distribution, and enables those who study the situation to make deductions relative to the service rendered and the distribution of the institutions, geographic and otherwise.

The *Journal* comments editorially on the development of hospitals in rural and urban areas and makes deductions relative to the need of further extension, and also points out the possibilities of going beyond the needs of hospital requirements when compared with the demand and support for the institutions. This comment is to express appreciation of the annual study and the service rendered by the *Journal of the American Medical Association*.

VARIATION IN THE CONTRIBUTORY HARMFULNESS OF PETROLEUMS

THE Manchester Cancer Committee is investigating petroleum oils and tars from the standpoint of their harmfulness as contributory causes of cancer. It seems that two oils from the same region rarely exhibit identical potencies, but the report is that the oils of some sections are less harmful than that of other territories. It may still be questioned whether the classification has gone far enough to report results definite and accurate, however, foundation has been laid by Dr. C. C. Twort for further research which will interest investigators of our profession and other research workers. The investigations may lead to discoveries other than the causes for high mortality from cancer in oil fields and petroleum refineries.

A BILL FOR EXTENDING THE LIFE OF THE NRA

S. 2445 (by Senator Harrison) seeks to extend the life of the NRA. Cooperating, by delaying a decision on the constitutionality of the National Industrial Recovery Act, the Solicitor General will ask (?) the Supreme Court to dismiss the government's own appeal in the Belcher case. "After the dismissal of the appeal, the Supreme Court's docket will not include any case in which that tribunal might have the opportunity of deciding a broad issue relating to the National Recovery Act." There seems, therefore, no immediate prospect of a final decision by the Supreme Court in an NRA case.

Press opinions are to the effect that the decision was reached as being preferable to have flaws in the measure removed by legislation rather than to risk a decision by the Supreme Court holding the present statute invalid on the ground of an unconstitutional delegation by Congress of its legislative authority and thereafter remedy the defect. Seemingly, this action delays enforcement of the codes in certain particulars, on the part of a minority there is a purpose to proceed with the appeal of the Belcher case. (This comment was written prior to court action.)

THE QUANTITATIVE DETERMINATION OF ALKALOIDS WITH BROMINE *

BY ROBERT A HATCHER AND ROBERT L HATCHER

Hart (1) reported that one molecule of quinine in solution absorbs four atoms of bromine, and that the former could be estimated quantitatively by means of *N*/10 bromine solution, 1 cc of which is decolorized by 81 mg of quinine

Weiss and Hatcher (2) described a method for the quantitative estimation of small amounts of quinine and quinidine in pure solutions and in those which contain extracts of tissue, by means of an aqueous solution of bromine. The method depends on the absorption of the bromine, the end-point being the disappearance of the yellow color. Haag (3) reported that this method may be used for the quantitative determination of brucine, caffeine, cinchonidine, procaine, strychnine, theobromine and certain other alkaloids, but that it is not available for the estimation of atropine, cocaine, morphine, sparteine and certain other alkaloids

In the course of studies involving the quantitative estimation of morphine in extracts of animal tissues, it was found that the presence of very small amounts of impurities sometimes interfered with the quantitative colorimetric determination of morphine by means of Marquis' reagent, and it was decided to investigate the availability of bromine solution for the estimation of morphine and various other substances

TECHNIQUE

The general method is as follows. Dilute 1 volume of the official (U S P X) *N*/10 bromine solution with 9 volumes of distilled water. Dissolve the substance to be tested in distilled water, in the case of alkaloids in the proportion of $1/400$ of the molecular weight in grams in 1 liter. Place 1 cc of *N*/100 bromine solution in each of a series of colorless or greenish (not yellowish) test tubes of about 18 cc capacity and of about 11 mm diameter, add the solution of the substance to be tested in successively increasing volumes, then add 0.3 cc of about 12 per cent HCl to each tube, and after the reaction is complete (or after thirty minutes), observe in which tubes the color of bromine persists. The tube is held at right angles to the light, preferably from a northern exposure—not in direct sunlight—and the solution is observed transversely. The end-point is the mean of the largest volume which fails to discharge the color of bromine and the smallest volume which decolorizes it completely. If a greater degree of precision is necessary, the experiment is repeated with less difference in the successive volumes of the solution added to the bromine solution. Solutions of the substance of known concentrations, which in every case should approximate that of the one being examined, should be used in exactly the same way as a control. Moderately dilute solutions of all substances the concentrations of which were not known to the observer, were used, the strength of the controls being known. Solutions of greater dilutions, differing in concentration by 10 per cent, and designated only by letters 'A', 'B' and 'C,' were classified correctly by the test. The combining powers of alkaloids vary; for example one molecule of cinchonidine decolorizes two atoms of bromine, one molecule of procaine de-

* From the Department of Pharmacology, Cornell University Medical College, New York

City

Received February 23, 1935

colorizes four, in moderate concentration, but the proportions are less exact with increasing dilution. That concentration which combines quantitatively with an equal volume of $N/100$ bromine solution is conveniently termed the "Standard Solution" of that particular substance. The concentrations of such "Standard Solutions" vary from 1-447 in the case of cinchonine, to 1-5850 in the case of antipyrine.

As little as 0.1 cc. of $N/1000$ bromine may be used for testing substances in very low concentrations. Where the concentration of bromine in the mixture of reagents is less than that of $N/5000$, 0.5 cc. of about 24 per cent HCl is used, and an interval of at least ten minutes is allowed for the release of the bromine and its combination with the substance to be tested.

A preliminary test for solutions of moderate concentration is made as follows. To 1 cc. of $N/100$ bromine solution in a test-tube, add 0.3 cc. of 12 per cent HCl, then the solution to be tested is added slowly from a pipette graduated in $1/100$ cc. until the color of bromine is discharged. In order to facilitate the detection of the least tinge of color due to bromine, comparison is made with a control in which there is a slight excess of the substance under examination. The average of several tests is taken. For some substances this test is about as accurate as either of the modified methods.

First Modification—After the reaction is complete, 0.25 cc. of chloroform is added and the tube is shaken. Any free bromine is taken up by the chloroform, which assumes a yellowish tint. In some cases the end-point in the first method is obscured by the development of color. In such cases the use of chloroform is necessary, but even this fails in those cases where the color other than that of bromine appears in the chloroform.

Cloudiness develops slowly in the chloroform in the presence of a trace of bromine, too slight to afford a tint, but since cloudiness is also induced under conditions that cannot be controlled, it was utilized in only a few tests. It may afford an extremely delicate test under conditions that avoid the disturbing factors.

Second Modification—In some cases with moderate concentration, and in all cases with very low concentration, neither the general method nor the use of chloroform affords satisfactory results, in such cases a fraction of a milligram of apomorphine is added, and the test-tubes are shaken. A trace of free bromine (about 1-600,000) is indicated by a pink color appearing within thirty seconds. The mean of the results of several determinations is accepted as the end-point. Immediately after the addition of the apomorphine the observation is made obliquely downward through the solution. As previously stated, rather rigid control solutions are necessary, hence one must know roughly the concentration of the solution under examination.

The following factors concerned with the technique have received consideration.

1. Time of Reaction

- (a) Substances which react slowly with bromine may require thirty minutes after the addition of HCl.
- (b) The chloroformic extraction of free bromine requires from a few seconds to one minute.
- (c) Apomorphine reacts rapidly with free bromine and since it displaces some substances slowly the mixture is observed within thirty seconds.
- (d) The rate of the reaction of codeine sulphate, heroine hydrochloride and morphine sulphate is accelerated by H_2SO_4 , the acceleration increasing with the concentration of H_2SO_4 .

2 Concentrations

- (a) Bromine in very dilute solutions is extracted imperfectly by chloroform, and less than 1 in 600,000 is not detected even with apomorphine, hence the comparison of a very dilute solution of unknown concentration with a much more concentrated control would result in a large error
- (b) The concentration of HCl required to liberate bromine rapidly varies with the concentration of the latter, but an excess of HCl should be used, the optimum being 0.3 cc of 12 per cent HCl per cc of $N/100$ or $N/1000$ Koppeschaar, very low concentrations of the solutions require as much as 0.5 cc of 20 per cent HCl
- (c) There is no exact limit to the dilution of a substance which may be estimated with a bromine solution, since the error increases with dilution. It is not usually feasible with chloroform to employ a solution of less than Standard/100 ($1/100$ the concentration of that which decolorizes an equal volume of $N/100$ bromine solution). When apomorphine is used without the addition of chloroform, the concentration in some cases may be Standard/400

3 Volatilization of Bromine

- (a) The loss of bromine through volatilization depends partly on the volume, more on the depth, of the solution. The loss is negligible with rapidly reacting substances but must be considered with those which react slowly. The loss of bromine is minimized by adding the HCl after having added the solution to be tested. Heat accelerates the reaction but it may increase the loss of bromine. Brucine sulphate and codeine sulphate were estimated at 25° and 32° C with an interval of thirty minutes for completing the reaction. In each case there was a difference of about 5 per cent due to the greater loss of bromine at the higher temperature. Slight differences of temperature are not important in estimating substances which react rapidly with bromine.
- (b) The loss of bromine is one of the chief objections to the use of the unofficial solution of bromine which Weiss and Hatcher employed. This may be minimized by using a micro-burette having a three-way stop cock connected with an all-glass syringe. The tip of the syringe must be in contact with the intake of the burette in order to avoid the action of bromine on rubber tubing.

4 Illumination

Light and the background influence the precision of borderline observations. Daylight, and electric light with a blue lamp are satisfactory. White, unglazed paper affords the best background.

5 Cloudiness in the Chloroform

This appears eventually in the chloroform in solutions in which there is one part of free bromine in two millions, but it was of little value in our experiments because it occurred at times from unknown causes. It appears in chloroform underlying water when concentrated HCl is added, but not when chloroform is added to any concentration of HCl. Occasionally a tinge of color of unknown origin (having no relationship to the presence or absence of free bromine) appeared in the chloroform.

The simple description of the technique and statements of the approximate average error in the estimations of various substances would make the method appear more simple and accurate than it will be found in individual cases unless one has had practice, and will devote the necessary time to the estimation. The results presented here are based on a very large number of experiments involving many thousands of test-tube examinations.

Amidopyrine—The simple decolorization method proved more satisfactory than the chloroform modification in the estimation of concentrations up to 1-30,000. For more dilute solutions this method is not practical. When an excess of amidopyrine is added a purple color may appear, irregularly it fades after a few minutes.

The chloroform modification is less satisfactory because of the pink color which appears in the chloroform and interferes with borderline observations, it also interferes with the apomorphine test when apomorphine is added after chloroform, but not if the chloroform is omitted.

It is probable that concentrated solutions (up to about 1-5000) may be estimated with errors of 3 per cent by the decolorization method, the error being slightly greater with chloroform. Apomorphine without chloroform affords a more accurate and more delicate test, and it was used satisfactorily with concentrations as low as 1-700,000.

Antipyrine—The reaction requires about two minutes. The error with chloroform may be as high as 2 or 3 per cent for concentrated solutions because of the development of a slight color. Less of antipyrine than of any other substance used is required to decolorize 1 cc. of bromine solution, and satisfactory estimations of it in concentration of 1-1,200,000 were made with apomorphine.

Apomorphine Hydrochloride—The reaction with bromine begins at once but it requires some time for its completion when only traces are present. A pink or intense red color develops dependent on the concentration, the chloroform takes up part of this color which interferes with the precision of the observations. One part of bromine in 600,000 parts of water may be detected with an excess of apomorphine. One part of apomorphine in 1,200,000 parts of water affords a pink tint with an excess of bromine. This affords a means of determining roughly the amount of apomorphine present in solution.

Brucine Sulphate—The reaction requires about thirty minutes, and a slight color develops in the solution, hence the simple decolorization method is unsatisfactory. The chloroform modification affords a satisfactory result. Apomorphine is useful with concentrations of 1-40,000, or less but not with much more concentrated solutions of brucine.

When brucine sulphate is added after the addition of HCl to bromine solution, a pink color develops immediately and changes rapidly to yellow, then to orange, and finally to pink with an excess of brucine sulphate. Hence it is possible to estimate the amount of brucine sulphate by this method. After the addition of chloroform the supernatant liquid in all tubes remains, or becomes, deep pink.

Caffeine—The reaction requires about twenty minutes and the solution develops a slight color, hence the simple decolorization method is unsatisfactory, but the chloroform and apomorphine modifications afford satisfactory results. After the addition of chloroform a slight color appears in the chloroform. This must be disregarded, but it interferes only slightly with the observation of borderline cases. Dilutions up to 1-165,000 were estimated by both modifications with moderate errors.

Codaine Sulphate—The reaction requires about thirty minutes. The chloroform and apomorphine modifications may be used for the estimation of concentrations of about 1-100,000. Apomorphine was not used with more dilute solutions. The decolorization method is unsatisfactory because of the development of a yellow color. In general, codaine behaves about like morphine.

Cinchonidine and Cinchonine—The reaction is almost instantaneous. Solutions of 1-1000 may be estimated with an error of less than 1 per cent. In concentration of 1-100,000 the error is about 5 per cent. There was no appreciable difference in the results when these alkaloids were dissolved in 0.1 per cent, or 1.6 per cent sulphuric acid.

In a few experiments with cinchonine and some other substances a green color was observed in some of the test-tubes after the addition of apomorphine, this was not investigated further

Dionine—The reaction occurs slowly and there develops in chloroform a color which interferes with borderline observations. Only preliminary tests were made

Emetine—The reaction occurs slowly, and the solution becomes yellow. Chloroform soluble emetine may be estimated by substituting ether for chloroform, but the reflection of the yellow color on the ether makes borderline observations uncertain

Morphine Sulphate—The reaction is practically complete in thirty minutes. The resulting solution develops a color resembling that of bromine, hence the simple decolorization method cannot be used but this color does not pass into the chloroform, and the chloroform modification affords a satisfactory test. The error is less than 1 per cent for solutions up to 1-3000, and about 5 per cent for concentrations of about 1-200,000. The apomorphine test is applicable to very dilute solutions, and concentrations of about 1-120,000 were estimated with errors of about 5 per cent

Procaine and Tulocaine—The reactions are very rapid. Solutions of 1-2000 may be estimated with an error of less than 1 per cent, in concentrations of 1-300,000 the error is about 5 per cent

Quinine and Quinidine—These may be estimated by adding to the point of decolorization probably better than by the chloroform and apomorphine modifications, but one of us (R. L. H.) could not estimate them with errors of less than 10 per cent, owing to the development of a yellowish color, which, however, was invisible to the other (R. A. H.)

Strychnine Sulphate—The reaction requires about ten minutes. Satisfactory estimations were made with dilutions up to 1-100,000. A few tests of solutions of about 1-150,000 gave errors of about 10 per cent

Theobromine—The chloroform and apomorphine modifications afford satisfactory results. The reaction is complete in about thirty minutes. The method of simple decolorization affords at least a rough test. Dilutions up to 1-350,000 were estimated with errors of about 5 per cent

Picrotoxin—An aqueous solution of picrotoxin, 1-1000, may be estimated with an error of about 1 per cent and solutions of much lower concentration may be estimated with a slightly greater error. This is the only simple quantitative chemical test for picrotoxin with which we are acquainted

Salicin—The reaction requires about thirty minutes, the chloroform method is satisfactory. Apomorphine was not tried

Salicylic Acid—The complete reaction requires about 30 minutes but it is nearly complete within 3 minutes. The chloroform modification permits of an accurate test within 5 or 10 minutes after the addition of HCl, the general method (decolorization) is less satisfactory, but it may be used with a control. Salicylic acid decolorizes N/10 bromine solution almost as actively as antipyrine, and with the apomorphine modification it was estimated in a concentration of about 1-900,000. Salicylic acid in concentrated solution forms with bromine a precipitate, which is soluble in chloroform, it does not interfere with the test

Protocol showing the volume of solution of procaine HCl N/200 (1.364 mg. per cc.) which absorbs the bromine in 1 cc. of N/100 bromine solution

Preliminary Test—In each of two tests the gradual addition of 0.53 cc. M/200 Procaine HCl-solution to 1 cc. of N/100 bromine and 0.3 cc. 12 per cent HCl caused complete decoloration

Final Test—To each of 16 test tubes there was added 1 cc. of bromine solution N/100 and 0.3 cc. of 12 per cent HCl. Successively increasing amounts of Procaine solution M/200 were added. Observations were made immediately after 1 minute, after 10 minutes, at the end of which time chloroform was added, and 5 minutes later a trace of apomorphine was added. The intensity of color in the aqueous layer, in the chloroform, and that induced by apomorphine affords a clue to the amount of unabsorbed bromine. The degree of color is expressed as 'xx' (deep color), "xx," "x" (barely perceptible color), "—" (no color perceptible)

Procaine	Immed	1 Min	10 Min	Chlor 10 Min	Apomorph 15 Min
0 3 cc	xxx	xxx	xxx	xxx	xxx
0 35	xxx	xxx	xxx	xxx	xxx
0 4	xxx	xxx	xxx	xxx	xxx
0 42	xxx	xxx	xxx	xxx	xxx
0 44	xxx	xxx	xxx	xxx	xxx
0 46	---	xx	xx	xx	xxx
0 47	---	xx	xx	xx	xx
0 48	---	x	x	x	xx
0 48	---	---	---	x	xx
0 49	---	---	---	x	xx
0 5	---	---	---	?	x
0 5	---	---	---	?	x
0 51	---	---	---	---	---
0 52	---	---	---	---	---
0 52	---	---	---	---	---
0 54	---	---	---	---	---

The results indicate that 1 cc of *N*/100 bromine solution is decolorized by 0.5 cc Procaine HCl *M*/200, as shown by the chloroform test and by 0.505 cc shown by the apomorphine test. Hence 0.682 mg Procaine HCl absorbs 0.7992 mg bromine.

SUMMARY

1 Tenth normal bromine solution (Koppeschaar's solution) was used for the quantitative estimation of a number of alkaloids. Two general modifications of the method are described.

2 By this means quantitative estimations of a number of alkaloids may be made with an error of about 0.5 per cent in concentrations of about 1-1000.

3 The error in the quantitative estimation of substances in solutions of unknown concentration increases with the dilution, but antipyrine, amidopyrine and salicylic acid in concentrations of 1-1,000,000 may be determined with errors of from 5 to 10 per cent.

4 The estimations are made with controls in which attention must be paid to concentration, temperature, rate of reaction and other factors discussed in the paper.

THE AIR-LIFT EXTRACTOR APPLIED TO THE ANALYSIS OF ALKALOIDAL DRUG EXTRACTS

BY L. D. SEIF AND T. H. RIDER

The extraction of alkaloids from pharmaceutical preparations has always been time-consuming and many attempts have been made to accomplish the extraction by means of automatic devices. Most of these have been regarded as unsuitable because they depend upon refluxing of the solvent by heat (1) with a resultant possible decomposition of the alkaloid and because of the difficulty of determining when the extraction is complete (2). The air-lift extractor (3) ac-

compleishes the extraction at room temperature, thereby eliminating any error due to heating and it is provided with a stop-cock by means of which samples may be drawn off and tested for completeness of extraction

In the original articles this extractor was used for the extraction of organic acid and its collection and measurement in standard alkali solution. In the present series of experiments the reverse of this operation is performed, an organic base is extracted and deposited in an acid solution. By this procedure two series of hand shake-outs are eliminated and it is then only necessary to remove the acid solution from the apparatus, make it alkaline with ammonia, proceed with the final extraction in a separatory funnel and titrate or weigh the alkaloid in the usual manner. Ammonia is used in the apparatus in place of caustic alkali because chloroform is not decomposed as readily by ammonia (4) and because in making the solution alkaline with ammonia the analysis more closely parallels the official methods for alkaloidal assays (5). A correction factor is not necessary since the acid solution itself is not titrated but must undergo another extraction before the alkaloid is titrated.

Method—The large tube of the apparatus (3) is filled nearly to the overflow with chloroform, the preparation to be extracted is superimposed upon it and made alkaline with ammonia. A small quantity of chloroform is placed in the smaller tube, 40 cc of 5% sulphuric acid is added and then chloroform until the top of the acid layer is almost to the inlet. The air (or nitrogen) is allowed to enter and extraction continued until all of the alkaloid is deposited in the acid layer. This point may be determined by removing a small quantity of chloroform solution through the stop-cock at the bottom of the tube and testing it in the usual manner with Mayer's Reagent. About four hours are required for the complete extraction of the alkaloid. The acid is then removed from the tube, the tube rinsed with water and the final extraction made with chloroform in a separator after making the acid solution alkaline with ammonia.

A series of extractions made by the air-lift extractor and checked by the hand shake-out method of the U S P X shows the two methods to agree within the limits of experimental error (cf table). The air-lift extractor method requires about one-half the actual working time of the other method although the total elapsed time is somewhat longer.

EXTRACTION OF ALKALOID FROM DRUG EXTRACTS BY THE AIR-LIFT EXTRACTOR AND U S P X METHODS

Sample	Air Lift	U S P X
Powd Ext Nux Vomica	12.77% alkaloids	12.83% alkaloids
Fluidextract Nux Vomica	(a) 2.55 Gm alkaloids (b) 2.17 Gm per 100 cc	(a) 2.52 Gm alkaloids (b) 2.20 Gm per 100 cc
Fluidextract Belladonna	0.363 Gm per 100 cc	0.390 Gm per 100 cc
Tincture Hyoscyamus	0.00765 Gm per 100 cc	0.00788 Gm per 100 cc

THE STABILITY OF DIOTHANE SOLUTION II *

BY E S COOK, K BAMBACH AND T H RIDER

In a previous paper (1) it was reported that prolonged aging or heating of diothane solutions produces a very slight degree of decomposition, yielding a substance containing a primary amino group which may be detected by diazotization and coupling with beta-naphthol. It was pointed out that such a substance could be either an aminobenzoate, formed by rearrangement, or aniline, formed by hydrolysis. A final decision as to the nature of the alteration product was not reached, but it was inferentially shown that its concentration probably did not exceed 1 100,000.

A detailed study of the hydrolysis of diothane by extreme conditions has shown that aniline is, in fact, produced when the hydrolysis is carried out with alcoholic potash. It has been possible to develop a method whereby aniline can be quantitatively recovered. While the details of this experimental work will be published elsewhere, the conclusions are reported in support of the belief that the primary amino compound detected is in all probability aniline.

When diothane solutions are diazotized and coupled with beta-naphthol, as previously reported, the color produced is concentrated upon the precipitate of diothane free base which forms as a result of the alkalinization of the solution. This renders small amounts of color readily detectable but does not make quantitative color comparison easy. The reaction when modified by conducting it in alcohol, in which the free base is soluble, gave a homogeneous color which, however, was not sufficiently intense for colorimetric comparison in the low aniline concentrations encountered.

The standard colorimetric procedure for small amounts of aniline (development of a yellow color with bleaching powder solution) (2) proved to be inapplicable in the presence of diothane. When this reaction was potentiated with phenol (3), the typical blue color appeared but not in sufficient strength for purposes of quantitative comparison.

A diazotization method has been developed using H-acid

instead of beta-naphthol according to the suggestion of Minaev, Svetlyakov and Frolov (4). This reaction was carried out in the presence of alcohol and proved to be of the utmost sensitivity. Concentrations of aniline as low as 1 10,000,000 can be detected qualitatively, which considerably exceeds the 1 500,000 limit claimed by the Russian investigators.

In applying this reaction ten cc. of 1% diothane solution are placed in a test-tube, 0.1 cc. of 0.5N HCl is added, the solution is cooled in an ice-bath and 0.1 cc. of a 10% aqueous solution of sodium nitrite is added. The solution is kept cold for 10 minutes and then made alkaline with 0.5 cc. of a 5% aqueous solution of sodium bicarbonate. The precipitate of diothane base is dissolved by the addition of 8 cc. of alcohol and then 0.2 cc. of a fresh 3% solution of H-acid is added. The H-acid solution is made by dissolving 0.75 Gm. of sodium bicarbonate in 50 cc. water and

* From the Research Laboratories of The Wm. S. Merrell Company, Cincinnati, Ohio.

adding 1.5 Gm of H acid. Five minutes after the addition of the H acid solution to the diothane base solution the color is compared with that of a standard aniline solution which has been coupled with H-acid in exactly the same way and at practically the same time.

The standard aniline solution is made by the addition of a known amount of redistilled aniline to a fresh 1% diothane solution. This diothane solution itself should give no color when coupled with H-acid in the manner described above, indicating that it contains no aniline, or at least that the concentration of aniline present is less than the limiting sensitivity of the test.

Lovibond tintometer readings have been taken of all test colors wherever possible, and it was noticed that the color of a given solution deepened upon standing over night. This deepening in color was not detectable for two hours after the test was completed but sixteen hours or more later was noticeable. The H acid solution itself darkens with time, and this fact is at least a partial explanation of the darkening of the test colors with age.

RESULTS

The above procedure has been applied to several 1% diothane solutions which had been aged for varying periods and to others which had been sterilized at 100° C, both with and without the addition of acid, for varying periods of time. The results are summarized in the following tables.

TABLE I—AGING OF DIOTHANE SOLUTIONS

Age (Months)	Estimated Aniline Content
Fresh	Neg (<1 10,000 000)
7	1 350,000
9	1 200 000
19	1 80 000

TABLE II—STERILIZATION OF DIOTHANE SOLUTIONS (NO ACID ADDED)

Length of Sterilization (Hours)	Estimated Aniline Content
1	1 150,000
4 1/2	1 40,000
18 1/2	1 20 000

TABLE III—STERILIZATION OF DIOTHANE SOLUTIONS (ACID ADDED)

Length of Sterilization (Hours)	Estimated Aniline Content
1	1 200 000
4 1/2	1 60,000
18 1/2	1 30 000

The solution, the testing of which is reported in Table II, was unacidified and had a p_H of about 5.0. The solutions, the testing of which is reported in Tables I and III, were manufacturer's stock solutions, the p_H of which had been adjusted to 4.5–4.7, during manufacture. It is evident that the addition of excess acid inhibits the development of aniline on sterilization.

The samples which were sterilized for 18 1/2 hours became slightly yellow and the free base, when precipitated, was yellow. There is, of course, no need for such lengthy sterilization in practice, and such discolored solutions would automatically be discarded by the careful user.

It is of interest to estimate the percentage decomposition of the diothane solution which is necessary to produce the amount of aniline actually detected. Assuming that 1 molecule of aniline is developed by the decomposition of 1 molecule of diothane (complete hydrolysis would yield twice this ratio), complete decomposition of a 1% solution of diothane would lead to an aniline concentration of 1

part in 464 This would mean that a concentration of aniline of 1 80,000 as found would represent a decomposition of only 0 6% of the diothane present Expressed in another way, this would mean that a 1% solution of diothane which had been aged for over 1½ years would still contain at least 0 99% of diothane The sample sterilized for 18½ hours still contained over 0 98% of diothane

This estimation of the maximum amount of diothane which would be decomposed is in harmony with the previously published fact (5) that diothane solutions when sterilized for prolonged periods do not show a perceptible loss in anesthetic activity We have found that, so long as the diothane solution remains clear and colorless, neither aging nor sterilization affects the local anesthetic potency

The aging of diothane solutions is being further studied with a view to correlating aniline formation with p_H changes in order more fully to elucidate the nature of the alterations taking place

SUMMARY

1 Aging or prolonged heating of diothane solutions produces a very small amount of aniline The maximum concentration produced by sterilization (18½ hours at 100°) is 1 20,000 in an unacidified solution, in the acidified solution as furnished by the manufacturers the maximum is 1 30,000 Ordinary solutions show a concentration of about 1 350,000 This change is too slight to affect the local anesthetic potency

2 Addition of acid inhibits the formation of aniline in diothane solution

3 So long as a diothane solution is clear and colorless its local anesthetic potency is unchanged by aging or sterilization Solutions which have for *any* reason become cloudy or discolored should not, of course, be used

4 A very delicate colorimetric method for the estimation of small amounts of aniline has been employed It is capable of detecting aniline in concentrations of 1 10,000,000

HONORING CRAWFORD W LONG

The centennial of graduation from University of Georgia by Crawford W Long, physician-pharmacist, was celebrated in Athens, March 30th Many references to him may be found in the JOURNAL, among them 13 51 (1924), 15, 317 (1926), 17, 517 (1928)

U S P STANDARD FOR DIGITALIS *

BY F A UPSHER SMITH ¹

The Committee of Revision of the United States Pharmacopœia has under consideration the standard to be adopted for digitalis in the U S P XI, and the best means of ascertaining its strength. The U S P X standard is a minimum systolic dose, by the one-hour method, not exceeding 0.006 cc of tincture, equivalent to 0.0000005 Gm of ouabain, for each Gm of body weight of frog. In Europe there is a strong movement in favor of the adoption of the International Standard Digitalis Powder as the standard for digitalis.

At the Frankfurt Conference it was recommended: "That when the dosage of digitalis or its preparations is expressed in units of activity, the unit employed for any preparation and in any country should be an international unit, which should be defined as the specific activity contained in 0.1 Gm of the international standard powder."

The International Standard Digitalis Powder has been adopted in the German Pharmacopœia, the French Codex and the British Pharmacopœia (1932). The standard as given for Digitalis Pulverata in the B. P. (1932) is as follows:

"This powder must be assayed by the *biological assay of powdered digitalis* and its strength must be stated in terms of the *international standard digitalis powder* of which 0.1 Gm is taken to have an amount of activity described as 1 Unit."

The B. P. gives alternative directions for the assay of digitalis and its preparations, using a frog method or a cat or guinea-pig method.

The International Standard Powder consists of a carefully dried mixture of ten samples of digitalis leaves collected from different sources. The Sub Committee on Digitalis of the B. P. (*Pharm. J.*, 127, 23 (July 11, 1931)) stated that "it was intended, when the mixture was made, that the potency of the mixture should represent the average potency of digitalis leaves, and records published by the Pharmaceutical Society of Great Britain show this to be the case." (See *Quart. J. Pharm.*, 1, 19 (1928)).

Following the International Protocol, all official tinctures of potent drugs are of 10% strength. If a 10% tincture of digitalis is made from a digitalis of International standard then it will be stronger than one made from U S P digitalis. A comparison was made by Edmunds, Lovell and Braden (*Jour. A. Ph. A.*, 18, 778 (1929)). They concluded that the International Standard Powder was about 30 per cent stronger than the U S P X standard, frogs being used for the assay.

L. W. Rowe (*Jour. A. Ph. A.*, 22, 106 (1934)) finds, by the frog method, that the International Standard tincture is from 20 to 25 per cent more active than the U S P X tincture of digitalis.

J. H. Burn, then head of the Pharmacological Laboratory, Pharmaceutical Society of Great Britain (in the *Quart. J. Pharm.*, 1, 19 (1928)), commented as follows on this question:

"Further, the substitution of the international standard for the present ouabain standard will make no appreciable difference in the United States. In the Pharmaceutical Society's laboratory the lethal dose of tincture prepared from the international standard by the cat method

* Scientific Section, A. Ph. A., Washington meeting, 1935.

¹ From the Department of Therapeutic Trials of the Upsher Smith Company.

was found to be 0.76 cc per Kg, and that of the official U S P ouabain to be 0.06115 mg per Kg. Hence 1 cc of the tincture from the international powder was equivalent to 0.0804 mg ouabain. But the present U S P requirement is that 1 cc of a tincture shall be equivalent to 0.083 mg ouabain, so that the international tincture is for practical purposes the same as a tincture fulfilling the U S P definition."

Dr. Burn suggests that the U S P X tincture of digitalis is for practical purposes of the same strength as a tincture made from the International Standard Powder. It seems to me that his conclusion is based on the supposition that the lethal dose of ouabain is the same for the cat as for the frog.

It is apparent, therefore, that U S P digitalis is weaker in strength than the International Standard Digitalis Powder, and consequently, weaker than digitalis official in the British and German Pharmacopœias and the French Codex.

There seems to be no good reason for maintaining the present standard for U S P digitalis, which may be considered as about four-fifths the International Standard. On the contrary, the continuance of the present standard is open to serious objection. It offers a market in the United States for grades of digitalis that do not meet the requirements of leading European markets. In the case of a delicate vegetable drug, like digitalis, depending for its action on glycosides that are sensitive to heat, moisture and air, it is desirable that the collection, desiccation and storage of the drug should be done under such conditions that the glycosides shall be changed in composition as little as possible. If the temperature is too low the drying process is prolonged and the enzymes have a greater opportunity of decomposing the glycosides. A digitalis of low glycosidal content may therefore be contaminated with an undue proportion of decomposition products and these may be obnoxious in their action when taken internally.

Digitalis is one drug in the production of which too great care cannot be taken. The better grades of commercial digitalis are obtainable in which decomposition has been held to a minimum and the biological strength is above that of the U S P X.

In the world of finance it is generally accepted as a fact that "bad money drives out good money." If the standard for digitalis in the United States be continued below that of leading European countries it will result in attracting the lower grades of digitalis to this country.

Standards must, of course, be attainable. In recommending the adoption of the International Standard for digitalis in U S P XI, I am confident that the standard will easily be met. As a grower of digitalis I have frequently produced a dried leaf of twice the activity of the U S P standard. To adopt the International Standard means raising the present standard only about 25 to 30 per cent. One important result of taking this step would be that the tincture of digitalis of U S P XI would be equal in strength to that official in many leading European countries.

A plea for uniformity in the strength of digitalis preparations was made recently in the *J Am Med Assoc*, 102, 862 (Mar. 17, 1934), in a letter signed by a number of leading cardiologists. If such a plea is valid within a country it is equally so in an international sense, in the interest of travelers. By raising the official standard about 25 to 30 per cent the need for stronger tinctures of digitalis will disappear and a big step will be made toward achieving the desired end—uniformity in strength of the preparations of digitalis. Once this change in strength

was made there would be no further changes to make in the standard for this important drug

The value of a standard powder in bringing together the results of different workers has been described by this writer (*JOUR A PH A*, 20, 471 (1931)) Figures are there given showing how reference to the International Standard brought the results of tests on five samples of digitalis leaf made in three different laboratories to a closer agreement

THE CHOICE OF A BIOLOGICAL TEST

The biological testing of digitalis has raised questions which bristle with difficulties, and about which there is no unanimity The Revision Committee, according to Dr Edmunds (*J A M A*, 102, 1246-1247 (April 14, 1934)) favors a frog method It is not my intention to go into details in discussing the relative values of the frog and the cat method I do want, however, to call attention to the well known fact that a tincture of digitalis tested on frogs at intervals of three months or more will show a startling loss in strength, whereas the same tincture tested at similar intervals on cats, will only show a slight loss in strength This was demonstrated by Wokes (*Quart J Pharm & Pharmacology*, 2, 48 (1929), and 3, 205 (1930)) He found that tinctures from thirteen different samples of digitalis leaves, assayed by the frog method, showed a steady loss of activity in all cases During the first nine months the deterioration proceeded at an average rate of about 3% per month After that time the rate of deterioration gradually decreased, until about one-third of the activity had disappeared at the end of 16 or 17 months Assays by the cat method failed to detect any deterioration

Wokes cites the case of two tinctures A1 and A2, which were assayed when made, and found, in comparison with the International Standard leaves, to be 144 and 148 per cent by the cat method, and 189 and 206 per cent, respectively, by the frog method They were assayed by the frog method again over a year later and both had lost 46% of their original activity, A1 being now 102 per cent and A2 112 per cent

By the cat method these tinctures now had a potency of 142 and 148 per cent, respectively, having lost no activity Had they been diluted to the standard, when made, they would now be 46 per cent below standard, by the frog method, but satisfactory in potency by the cat method If, however, they had been stored undiluted, the cat method would show them much too potent, but the frog method would show them both to be of correct potency This illustrates a pitfall in assaying old digitalis tinctures

Foster and van Dyke (*JOUR A PH A*, 22, 381 (1933)) studied the effect of aging upon the potency of digitalis tinctures, assays being made on the cat and frog Aged tinctures were found to be less potent by assay in both species, however, the greater reduction in potency was usually observed in the frog The frog method makes it exceedingly difficult, if not impossible, for a manufacturer to guarantee the strength of tincture of digitalis, even for 3 months If the frog method be used at the time of manufacture, and the tincture adjusted to the U S P X standard, a check up 3 months later will show a greatly diminished strength This renders the manufacturer vulnerable to attack by the Pure Food and Drugs authorities, who are obliged to take the U S P for their guide

Dr Edmunds stated (in the letter referred to) that no manufacturer had advocated the cat method. By this I presume Dr Edmunds means "no manufacturer on the Committee of Revision." Outside of that body there are manufacturers who have used the cat method, and are still using it, in the belief that they are on safer ground. The cat method has the further advantage that it affords a means of calculating the physiological dose for a patient, by dividing the patient's body weight by 10 and giving that number of cat units in divided doses.

The adoption of the International Standard for digitalis in U S P XI, and the recognition of 100 mg of this powder as an International Unit, using cats for determining the strength, would provide the physicians with products whose dose would be easily calculated by the method of Eggleston. Instead of taking one-tenth the body weight in pounds, as in using cat units, the physician would take *one-twelfth* the patient's body weight in pounds and give that number of International Units, in divided doses.

We have had practical experience of the use of a standard powder for over three years, and are well satisfied that by adopting it we were able to maintain uniformity of strength with greater certainty than without a standard powder.

A national Standard Digitalis Powder for the United States would preferably be prepared from a mixture of powdered leaves from different sources. It would not be necessary to adjust the strength of such a U S P standard powder so as to make it equivalent, weight for weight, to the International Standard, but the ratio between the potencies of the two standard powders could be determined in a series of tests, one series with frogs, and another with cats.

The adoption by the U S P of the International Unit as a standard for digitalis products would be a simple matter. The unit of digitalis would be defined as the amount of activity contained in 0.1 Gm of the International Standard Digitalis Powder, so that 1 Gm of the International Standard represents 10 units.

The British Standard Digitalis Powder tested by different workers showed an average potency, with frogs of 138% of the International Standard or 13.8 units per Gm, so that 1 unit is contained in 0.0725 Gm of the British Standard Powder. When the comparison was made by means of cats the activity was found to be 116% of the International Standard, or 11.6 units per Gm, so that 1 unit is contained in 0.0862 Gm of the British Standard Powder.

Whether a cat or frog method (or both) is adopted in the U S P XI there will, therefore, be no difficulty in arriving at a satisfactory standard digitalis powder for use in the United States.

Paraphrasing the well-known axiom of homeopathy, there seems to be a unanimity of opinion among pharmacologists that, in the selection of standards, "*similia similibus æstuantur*" is a safe guide.

TWELFTH INTERNATIONAL CONGRESS OF PHARMACY

The Twelfth International Congress of Pharmacy, as heretofore mentioned, will convene in Brussels, July 30th to August 6th, under the patronage of His Majesty Leopold III, organized under the auspices of the International Pharmaceutical Federation, the National Pharmacy of Belgium, the Pharmaceutical Society of Anders.

Members attending the Congress will have a free admission to the World's Fair being held at that time and reduction rates on railroads. The opening session will be held in the Hall of Fame of the University of Brussels. The banquet will take place on August 2nd.

STUDIES ON THE BIOASSAY OF DIGITALIS *¹

II NEW LEG-VEIN AND INTRAMUSCULAR GUINEA-PIG METHODS

BY JAMES H. DEFANDORF

Guinea-pig, cat and frog methods for the assay of digitalis are optional in the recent British Pharmacopœia (1). In the United States the one-hour frog method is official (15) and the intravenous cat method (7) is highly recommended by various investigators (6, 8, 13), while the use of the guinea pig for this purpose is rather limited.

The practical value of the guinea pig in toxicological tests seemed to warrant further investigations with this animal in the assay of digitalis. New leg-vein and intramuscular minimum lethal dose methods with simplified technique were devised and checked against the subcutaneous guinea-pig method of Reed and Vanderkleed (10), the U S P X one-hour frog method (15), the modified four-hour U S P X frog method (4), the intravenous frog method of Smith and McClosky (14), and the intramuscular frog method of Dooley and Higley (5). Since some uncertainty seemed to exist as to whether the death of this animal following digitalis intoxication was primarily of cardiac or respiratory origin, this subject also was investigated by observing the relative occurrence of cardiac and respiratory failure.

METHODS

The Subcutaneous Guinea Pig Method (10)—Tincture of digitalis, rendered alcohol free by evaporation and diluted with water, is injected subcutaneously in the abdominal region of guinea pigs weighing about 240 Gm. and the minimum lethal dose determined, which is the smallest amount injected causing death within a period of two hours.

The New Leg Vein Guinea Pig Method—Guinea pigs ranging in weight from 250 to 350 Gm. were used. All alcohol was removed from the tincture by evaporation and the residue diluted with physiological saline to make preparations varying from 3 to 5 per cent in strength, so that the amount of fluid injected ranged from 1 to 2 cc., depending on the dose and size of the animal. The guinea pig was then securely tied abdomen downward to the special animal board and the large superficial vein on the dorsal and inner aspect of the hind leg was exposed according to the procedure of Roth (12). The preparation was then slowly injected at the rate of 1 cc. per minute in order to avoid toxic effects due to concentration of the drug. The symptoms were noted and the time of death recorded, the minimum lethal dose being the smallest amount injected causing death within two hours in over half the animals.

The New Intramuscular Guinea Pig Method—Guinea pigs ranging in weight from 250 to 350 Gm. were used. All alcohol was removed from the tincture by evaporation and replaced with physiological saline, so that the preparation retained its original drug strength. Dilutions were not made in order to avoid the injection of too large an amount of fluid. The dose was injected in equal amounts into the posterior muscles of each thigh. The minimum lethal dose is the smallest amount injected which caused death within two hours, in over half the animals.

The U S P X Frog Method (15)—This is the official method of the United States Pharmacopœia.

The Modified U S P Four-Hour Frog Method (4)—This method differs from the U S P X method only in that four hours instead of one hour are allowed for the absorption and action of the drug.

The Intravenous Frog Method of Smith and McClosky (14)—The minimum systolic standstill dose is determined one hour following the injection of digitalis into the abdominal vein of the decerebrated frog.

* Scientific Section, A. P. H. A., continued from Madison meeting A. P. H. A., 1933.

¹ Department of Pharmacology and Therapeutics, School of Medicine, the George Washington University, Washington, D. C.

The Intramuscular Frog Method of Dooley and Higley (5)—The dose of digitalis is injected in equal amounts into the thigh muscles of the frog. The minimum systolic dose is the smallest amount injected causing systolic standstill in one hour.

EXPERIMENTAL PROCEDURES

Four tinctures of digitalis, designated as "B," "C," "D" and "Dx," were examined. All except "Dx" were defatted tinctures made according to U S P X directions. "B" was made from Gilpin "M" leaves, "C" and "D" from McIlvaine leaves, while "Dx" was made from "D" by dilution, the degree of dilution being unknown to the author until all assays were completed.

In the guinea-pig tests male and female animals weighing from 250 to 350 Gm were used. They were kept in the animal building at room temperature and fed on a well-balanced ration consisting of a brand of prepared food known as Purina Rabbit Chow, and water, this diet occasionally being supplemented with hay and green leafy vegetables.

Food was withheld from the guinea pigs the night before the experiments and the animals were weighed to within one Gm immediately preceding the test. Doses were calculated on the basis of these weights. The alcohol-free preparations were not filtered before injection. Death occurring within two hours as the result of respiratory failure was taken as the end-point. Re-injected guinea pigs were not included in the results, as they invariably lost weight and were in poor condition for many days following the first injection, contrary to the observations of Vanderkleed and Pittenger (16).

The following is a typical protocol of the course of events in the new leg-vein method, the symptoms described being identical with those of the subcutaneous and new intramuscular methods, except for their slightly earlier appearance as the result of this method of administration.

Guinea pig, male, weight 326 Gm

Tincture B " Evaporated 15 cc. to 3 cc., and diluted residue with physiological saline to make a 5 per cent solution (1 cc. = 50 mg.)

11 20-11 22 Injected 1 cc. of above preparation (= 0.2 of a mg. per Gm.) into leg vein at the rate of 1 cc. per minute

11 30 Grinding of teeth, retching attempts (nausea)

11 35 Violent trembling, retching and salivation, slow labored respiration

11 40 Gasping clonic convulsions

11 42 Violent convulsions, animal falls on side, exhausted from respiratory distress

11 45 Animal remains lying on side in comatose condition, respiration very slow and labored

11 48 Respiration stopped

11 50 Heart still beating

11 55 Chest opened and heart observed, auricles contracting efficiently but slowly, ventricles contracting efficiently but very slowly (36 per minute)

12 00 Ventricles stopped, auricles beating slowly

1 00 Auricles still beating

1 30 Auricles stopped

The results shown in Table I are typical, representing numerous similar observations in all three guinea pig methods, and indicate that respiratory failure is the primary cause of death. After respiration has stopped the ventricles continue to beat in an efficient manner at a slowed rate, and may continue to do so for several minutes.

TABLE I—OCCURRENCE OF RESPIRATORY AND CARDIAC FAILURE IN GUINEA PIGS FOLLOWING DIGITALIS INJECTION (TINCTURE 'C')

Animal Number	How Injected	Time to Respiratory Failure Minutes	Ventricle Minutes	Time to Cardiac Failure Auricle	Time between Respiratory and Ventricular Failure Minutes	Time between Respiratory and Auricular Failure	Dose in Mg per Gm
4 P	Subcut	103	106	Not observed	3	Not observed	0.25
5 B		30	102		72		0.3
6 I		96	143		47		0.3
6 J		119	139		20		0.3
6 K		96	113		17		0.3
6 L	Intrav	29	34		5		0.175
6 H	Subcut	101	110		9		0.3
6 M		55	93		8		0.3
6 N		67	77	252 mm	10	185 mm	0.35
6 P		51	108	251	27	170	0.35
6 R		79	95	249	19	170	0.35

At this time it should be mentioned that out of 281 guinea pigs injected using various doses of three tinctures and three methods of assay 155 animals died within two hours and only 10 of the surviving 126 died within twenty-four hours. It is therefore apparent that the two hours limit is entirely satisfactory from a practical standpoint.

TABLE II—SUMMARY SHOWING RESULTS OF GUINEA PIG AND FROG ASSAYS OF TINCTURES 'B', 'C', 'D' AND 'D\'

Tincture	Guinea Pig Methods			Frog Methods			
	Subcutaneous	New Leg Vein	New Intramuscular	One Hour U S P	Four Hour Modified U S P	Intramuscular (Dooley Higley)	Intravenous (Smith McClosky)
	Minimum Lethal Dose in Mg per Gm	Minimum Lethal Dose in Mg per Gm	Minimum Lethal Dose in Mg per Gm	Minimum Systolic Standstill Dose in Mg per Gm	Minimum Systolic Standstill Dose in Mg per Gm	Minimum Systolic Standstill Dose in Mg per Gm	Minimum Systolic Standstill Dose in Mg per Gm
'B'	0.25	0.175		0.8	0.8	0.8	0.4
'C'	0.3	0.2					
'D'	0.3	0.2	0.225	0.7	0.8	0.8	0.4
'D\''			0.4	0.9			

Table II is a brief summary of the minimum lethal and minimum systolic standstill doses obtained on four tinctures by guinea pig and frog methods, respectively. The number of animals used in the guinea pig assays ranged from 17 to 48 per assay method depending on the number needed to obtain clear cut results, and the number of animals from which the minimum lethal dose itself was determined never was less than 5 and never more than 12.

Tincture 'C' was exhausted before it could be assayed on frogs, so that it affords a comparison only of the subcutaneous and leg vein guinea pig methods.

Since tincture 'D\'' was a preparation of unknown strength made from tincture 'D' by dilution prepared particularly for further investigation of the new intramuscular guinea pig method first used in the assay of tincture 'D,' the guinea pig results were only checked against the official U S P X one hour frog method.

Analysis of this table shows that the minimum lethal dose in the leg vein method is smaller than that in the subcutaneous method, and in the one case where comparison is possible (tincture 'D') the intramuscular minimum lethal dose falls between the leg vein and the subcutaneous minimum lethal doses.

While three of the four methods indicate that tinctures 'B' and 'D' are of identical strength, the two guinea pig methods indicate that tincture 'B' is approximately 15 per cent stronger than 'D'. These results in themselves are insufficient for the purpose of determining which animal gave the better picture of the relative strengths of the two tinctures.

An interesting comparison of the intramuscular guinea-pig and the U S P X frog methods is furnished in the assay of tinctures 'D' and 'D\'' According to the new intramuscular guinea

pig assay tincture "D\ " is 56.3 per cent of the strength of tincture "D," while by the U S P X frog assay "D\ " is 77.7 per cent of the strength of "D " As tincture "D\ " was made by adding two parts of the menstruum to three parts of tincture "D " the former preparation was actually 60 per cent of the strength of tincture "D " It is thus apparent that the intramuscular guinea pig method gave a much more accurate evaluation than did the official U S P X frog method

DISCUSSION

The administration of lethal amounts of digitalis to the guinea pig causes death apparently by its toxic action on the respiration (protocol and Table I) In the case of observations on many other animals, the results of which are not included in Table I, the heart beats could be felt through the chest wall for some time after respiration had stopped

The question arises as to whether the conclusion of Richaud (11) is sound, that is, whether respiratory failure renders valueless the guinea pig as an assay animal for digitalis, a drug mainly used for its effect on the heart One of the principles of bioassay which Dale (3) and Burn (2) emphasize is that a test does not have to be identical with therapeutic effect as long as it measures the important active principle Comparison of the results obtained by four frog and three guinea-pig methods of assay on digitalis, in which artificial respiration was not employed, show a fairly close agreement, the advantage lying slightly on the side of the guinea-pig method It seems logical to conclude from these results that lethal dose guinea-pig methods, in which death is primarily due to respiratory failure, are reliable measures of the activity of digitalis, when compared with frog heart methods

The subcutaneous, new leg-vein and new intramuscular guinea-pig methods possess advantages over the intravenous methods of Knaffl-Lenz (9) and that of the recent British Pharmacopoeia in that anesthesia is unnecessary, artificial respiration is not employed, and the operative procedure is less severe, as a result they are less time consuming and larger numbers of animals can be used in a given length of time, with a resultant decrease in experimental error

Preference in the three guinea-pig methods is therefore not dependent on relative bioassay value, as all apparently give satisfactory results, but upon utility as to time and technique The subcutaneous and new intramuscular methods are very simple and can be quickly performed The new leg-vein method is more time consuming The investigations with the new intramuscular method indicate that this method may prove to be of greater practical value in the assay of digitalis than the other methods

SUMMARY AND CONCLUSIONS

Male and female guinea pigs varying in weight from 250 to 350 Gm showed no apparent differences in susceptibility to digitalis

Guinea pigs once injected with digitalis should not be used again in assaying this drug, except in preliminary tests, as these animals lose weight and often remain in poor condition for many days following its administration

Evidence is presented which indicates that respiratory failure is the primary cause of death following the parenteral administration of digitalis to guinea pigs

The subcutaneous, new leg-vein and new intramuscular guinea-pig minimum lethal dose methods compare favorably with the frog heart method for the bioassay of digitalis

A COMPARATIVE STUDY OF THE ABSORBABILITY OF SIX CALCIUM COMPOUNDS *¹

BY A RICHARD BLISS, JR, AND ROBERT W MORRISON

INTRODUCTION

Two preliminary reports of this investigation have been published (1, 2) This paper reports the findings of the completed study, and covers the relatively wide gaps (0.25 mg) between the quantities of Magnesium Sulphate required to completely neutralize the absorbed Calcium, presented in the previous papers, as well as time intervals above and below the time factor (2 hours) used in the earlier investigations

The first study concerned itself with Dicalcium Phosphate, Calcium Chloride, Lactate, Glycerophosphate, Gluconate and Hexacalcium Inosite Hexaphosphate These six calcium compounds and Calcium Lacto-phospho-gluconate were the agents investigated in the second study The first six calcium combinations were employed in the final investigation

Since a review of the literature related to these investigations has been included in the reports already published, space will be conserved by omitting the review in this final paper

THE METHOD

The technique (6) employed in the final study was the same as that used before, and is based on the antagonism between magnesium and calcium, earlier experiments having shown that animals narcotized by magnesium are awakened by injections of calcium salts and conversely, animals which have absorbed increasing quantities of calcium require greater amounts of magnesium for narcosis Pure bred albino mice were used The calcium preparations were administered by stomach tube, and, after time intervals ranging from 30 minutes to 9 hours, magnesium sulphate was injected subcutaneously Controls were run at the same time

* Scientific Section, A Ph A, Washington meeting, 1935

¹ From The Reelfoot Lake Biological Station, Reelfoot Lake Tennessee

The mice received no water or food for from 12 to 15 hours before the ingestion of the calcium preparations. From 3 to 10 per cent aqueous solutions or suspensions of the calcium compounds were used. The magnesium sulphate was injected in the form of a 10 per cent aqueous solution. The index was the production of a definite degree of narcosis which presents itself with effective doses in from about 12 to 20 minutes after the injection of the magnesium sulphate solution. The required degree of narcosis was the point at which the mice lie on their backs without movement or attempts to turn over.

Extensive preliminary experiments demonstrated that 0.9 mg of magnesium sulphate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$) per Gm of body weight is just adequate for the production of the required state of narcosis in albino mice. If some of the ingested calcium was absorbed, then a greater amount of magnesium sulphate is required to produce narcosis than is the case where no calcium is administered or absorbed. The amounts of each calcium compound administered in mg per Gm of body weight is equivalent to 0.3 mg of calcium per Gm of body weight. The tables following are self-explanatory.

Table I presents a summary of the results obtained in the studies already published.

TABLE I—SUMMARY OF PRELIMINARY STUDIES

Calcium Salt.	Amt $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ Required for Partial Narcosis (Mg per Gm)	Amount $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ Required for Complete Narcosis (Mg per Gm)
Calcium chloride	1.25 (3 out of 3)	1.50 (3 out of 3)
Calcium lactate	1.00 (1 " " 3) 1.25 (3 " " 3) 1.50 (1 " " 3)	1.50 (2 " " 3) 2.00 (3 " " 3)
Calcium gluconate	1.00 (3 " " 3) 1.25 (3 " " 3) 1.50 (1 " " 3)	1.50 (2 " " 3) 2.00 (3 " " 3)
Dicalcium phosphate	1.00 (3 " " 3) 1.25 (1 " " 3)	1.25 (2 " " 3) 1.50 (3 " " 3)
Calcium glycerophosphate	0.90 (2 " " 3) 1.00 (1 " " 3)	1.00 (2 " " 3) 1.25 (3 " " 3) 1.50 (3 " " 3)
Hexacalcium inositol hexaphosphate	1.00 (5 " " 5) 1.25 (4 " " 7)	1.25 (3 " " 7) 1.50 (6 " " 6)

Since 0.9 mg per Gm of body weight is the minimum amount of magnesium sulphate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$) required to produce the desired state of narcosis in albino mice which have received no water or food for from 12 to 15 hours, by subtracting 0.9 from the magnesium sulphate values given in the tables, the amounts of magnesium sulphate required to counteract the absorbed calcium are obtained, the larger the quantity of magnesium sulphate required for complete narcosis, the greater the amount of absorbed calcium.

Magnesium sulphate was administered in ascending doses of 0.25 mg per Gm in the preliminary studies. In the final investigation the dose was stepped up in 0.05 mg per Gm quantities so as to determine more closely and accurately the critical points. With each series determinations were made at 30 minute, 1-, 2-, 3-, 4-, 5-, 6-, 7-, 8- and 9 hour intervals after the administration of the calcium preparations. Each mouse was used for but one experiment.

One series of tables will suffice to show how the final studies were made and recorded. Tables II through IX give the results obtained with calcium chloride.

At the end of the 7th and 8th hours further uniform decreases in amounts of Magnesium Sulphate required for narcosis were observed. Table X summarizes the results obtained in the entire investigations through the seventh hour.

TABLE X—SUMMARY OF COMPLETED STUDIES

Magnesium sulphate required for complete narcosis at various intervals

Drug	30 Min	1 Hr	2 Hrs	3 Hrs	4 Hrs	5 Hrs	6 Hrs.	7 Hrs
Calcium chloride	1 25	1 35	1 40	1 40	1 45	1 50	1 45	1 35

Calcium gluconate	1 30	1 30	1 35	1 45	1 55	1 50	1 45	1 40
Dicalcium phosphate	1 15	1 25	1 35	1 40	1 45	1 40	1 35	1 30
Calcium glycerophosphate	0 95	1 05	1 10	1 15	1 25	1 25	1 20	1 05
Hexacalcium inosite hexa-phosphate	1 20	1 25	1 30	1 35	1 45	1 45	1 40	1 35

DISCUSSION

The results obtained show that there is a fair degree of variation in the absorbability of the six calcium compounds studied. When arranged according to the maximum amount absorbed, they place themselves in the following order:

- 1 Calcium lactate
- 2 Calcium gluconate
- 3 Calcium chloride
- 4 { Hexacalcium inosite hexaphosphate
Dicalcium phosphate
- 5 Calcium glycerophosphate

With each compound there is a constant rise in the calcium absorbed until the fourth hour when a maximum absorption is reached for all of the calcium compounds studied excepting calcium chloride which requires five hours. The larger quantities of calcium are absorbed during the third, fourth, fifth and sixth hours after administration. The fall begins in the sixth hour.

It is interesting to note that the calcium-lactic acid combination heads the list. These observations are in agreement with the findings of McGowan and Berghem. McGowan (3) demonstrated with rabbits that the most important single factor influencing the absorption of calcium and phosphorus seems to be the acidity of the gastric contents. Berghem (4) has pointed out the significant influence the lactic acid radical has on the absorption of calcium, and suggested that the much higher proportion of lactose to calcium and phosphorus in human as compared with cow's milk may be a factor in the higher degree of utilization of the calcium content of the former. He attributes the fact to the production of a distinctly acid condition throughout the gastro-intestinal tract, due to increased lactic

acid formation in the intestine, Rowe and Kahn (5) having shown that the alkaline intestinal and pancreatic secretions and bile exert an inhibitory influence on the rate of calcium absorption

It is obvious that of the six calcium compounds studied, in albino mice, calcium lactate is the most rapidly and effectively absorbed calcium compound for oral administration. It is reasonable to assume that the same may hold in human subjects

The authors are indebted to Miss Jessie May Gill for valuable assistance during these studies in which over 900 albino mice were used

DRUGS AND BUGS *

BY ERNST T. STUHR ¹

The elemental forces which destroy and devour natural resources have long been interesting and fascinating to the curious mind. As the visible forces, such as floods, storms, famines and diseases, destroy progress in civilization, so too, are unnoticed destructive forces. Insects have long been known to be the most destructive of animals. Stored vegetable and animal products are subject to constant menace of invasion by parasites unless proper storing facilities and preventive precautions are observed.

The stock-room of the drug store is, in some instances, a disorderly, neglected and mistreated department of the store. If this is the case, a very untidy situation and atmosphere results, creating a haven for pest invasion of all kinds, including rodents (rats and mice), which are often carriers of bacteria and disease germs.

In general, drugs possessing an abundance of starch, inulin and sugars are most liable to the attack of pests. It should be kept in mind, however, that even in products not infested there is a gradual deterioration which in time renders many products unfit for use. Sanitary storage as a preventive measure is of importance in retarding deterioration.

Every retailer and wholesaler should be vitally interested and should profit by acquiring knowledge of the appearance and habits of the enemies which are harmful and detrimental to drugs in general. An acquaintance with the insect kingdom, as to harmful insect pests, their life cycles and habits and some of the possible preventive and combative means or methods, is essential. The ento-

mological knowledge of the pharmacist need not necessarily be exhaustive, therefore, a synopsis of the extensive class of insects, more numerous in species than all other animals combined, is sufficient

PHARMACO-ENTOMOLOGICAL DISTINCTION OF INSECTS ¹

Insects in the adult stage possess well-developed mouth parts. A simple classification or two-group division of insects will be considered according to mouth parts

- A Mouth parts fitted for chewing
- B Mouth parts fitted for sucking

The pharmacist should be interested for the most part in the so called "biting insects". The "sucking insects" have little opportunity to destroy materials commonly stocked in the drug store, which consists primarily of dry package materials. Certain of the so-called "sucking insects," however, cannot be ignored. Certain young insects have been provided by nature with jaws for biting, which later develop into sucking insects, e g, certain caterpillars (later become moths or butterflies)

During the past six years extended observations have been conducted on infested stocks with studies of causes of conditions and various possible means of combat for eradication of pests. Monthly, seasonal and yearly checks have been kept, primarily on the so-called "animal parasites" or insects, with enlightening results.

In this paper some of the pests commonly detrimental to stocks and some simple methods found useful in eradicating them are outlined. A list of the more susceptible drugs which are injured

by common pests should be most worthy of consideration

DESTRUCTIVE BEETLES INFESTING CRUDE DRUG STOCK ²

Fig 1 *The Drug Store Beetle*—A reddish brown insect 2.4 to 2.7 mm in length and covered with a short dense pubescence. It is cosmopolitan, being found in homes, stores, warehouses etc. This beetle infests nearly all sorts of dried plant and animal matter. The eggs are laid on the food, the larvæ working in. Pupation is within a cocoon and the life cycle is completed in less than two months. Control is by fumigating or by heating to 49° C. Carbon disulphide is the recommended fumigant for grains.

Fig 2 *The Square Necked Grain Beetle*—A reddish brown insect of about 2.5 to 3 mm in length. This beetle is more abundant in warmer climates but may be found in heated buildings and warehouses. It eats out the germs of the seed in which it develops. The life cycle is completed in about three weeks. Control as recommended by the U S D A for grain beetles is similar to that for the drug store beetle.

Fig 4—Crude drug stock found infested by square necked grain beetle

MEASURES FOR DETECTION, PRESERVATION AND EXTERMINATION

I Detective Suggestions—a Inspection of stock room, cellars counters packages, shelves containers laboratories and boxes is essential

b Evidences of pest presence indicated by much powder and broken pieces or bits in bottom of stock containers

c Determination of classification of pest—whether beetle, moth, fly mold rust, etc Knowing nature of the pest will assist in determining the proper remedy for effective extermination

II Preventive Suggestions—a Observe sanitation and cleanliness (insect parasites indicate filth)

b Store only pest-free products

c Keep vegetable and animal drugs in a dry, cool atmosphere (preferably in air tight containers, rooms or bins)

d Maintain ideal storing temperature—25° C (77° F)

III Combative Suggestions—Effective methods of extermination

a For eggs larvae and insects ³ Expose to temperature of 60° to 65° C (140° to 149° F) for about fifteen minutes in case of small amounts of products For larger quantities of materials the temperature exposures should be from two to three days Scald and thoroughly dry containers *Caution* High temperature with *volatile drugs* is reputed detrimental

³ Youngken, *Textbook of Pharmacognosy*

b For insect infested products¹ Use of fumigants Add several drops of carbon tetrachloride or chloroform (about 25 cc for each 100 cubic feet of drug) Two treatments are advisable, a week or two apart Either of the above insecticides or preservatives are essential and effective against destruction Camphor applications are reputed to be useful in the preservation of dried animal drugs

*IV Requirements of Ideal Pest Exterminators*²—*a* Must arrest growth or destroy parasite

b Must be more toxic to pest than host

c Must be adherent and maintain activating properties for a certain period of time

d Must enter into intimate contact with the parasites or their elements

*V Vegetable or Mold Parasites*³ (*Spore Producing Pests*) —Bacteria, fungi, lichens, molds, rusts, mildews and smuts produce fungus diseases Infest drug stocks exposed to warm, dark, damp atmospheres This group of pests is thought to deteriorate and decompose the active constituents of products Moldy drugs result when stocks are stored in damp atmosphere To prevent destruction keep in dry state

SUGGESTIONS AND PRECAUTIONS TO BE OBSERVED FOR THE PROPER STORING OF THE FOLLOWING CRUDE DRUGS

It is recommended that the drugs tabulated be kept in tightly closed (air-tight) containers, and if found to be infested, occasionally a few drops of chloroform or carbon tetrachloride be added to exterminate or prevent the attack (destruction) of the insects Gratifying results have been obtained for the eradication and prevention of pests in fresh stocks by the so-called "vacuum method" New supplies are placed in a vacuum chamber for several hours and then transferred to air-tight containers for storage

This paper is a preliminary report on an investigation being continued in coöperation with the Department of Entomology and the Oregon State Agricultural Experiment

Station The following drugs are tabulated in the report

Aconite, Aloe, Althea, Bitter and Sweet Almond, Angelica Fruit and Root, Apocynum, Aralia, Arnica, Asclepias, Aspidium, Belladonna Root, Berberis, Bryonia, Calumba Sweet Flag, Cantharides, Capsium, Caraway, Cheery, Colchicum Corm, Coriander, Cydonium, Dulcamara, Ergot, Euonymus, Fenugreek, Ginseng, Glycyrrhiza, Hydrastis, Inula, Iris, Jalap, Kava, Kola, Lappa, Linseed, Matricaria, Mezereum, Myristica, Parsley Root and Seed, Phytolacca, Pyrethrum, Pilocarpus, Rhubarb, Sabal, Sarsaparilla, Squill, Senega, Senna, Stillingia, Strophanthus, Sumbul, Tamarind, Trillium, Viburnum, Ginger

THE VOLATILE OIL OF *HYPTIS MUTABILIS* *¹

BY HAROLD W WERNER ²

The plant, *Hyptis mutabilis* (L C Rich) Briquet, is widely distributed in Florida. It is not, however, generally recognized by the above name, but by the name *H. spicata* (1)

Material for this investigation was collected near Gainesville, Florida. All the plants were apparently of the same race, however, at the time of collection the material was separated into that having green stems and that having reddish stems. The two batches of plant material produced oils which appeared to be identical.

Peckholt (2) and Schimmel & Co (3) evidently worked with different races of *H. mutabilis* as their oils differed somewhat from the oils produced by the writer. Epling (1) states that several races of the species can be recognized.

RED STEMMED MATERIAL

Two hundred and four Kg of green plant yielded by steam distillation 25 Gm, or 0.012% of a dark greenish oil with a faint mint-like odor and an after-taste resembling oil of cassia.

The constants of the oil were: 1 volume soluble in 1 to 3 volumes of alcohol; 1 volume insoluble in 4 volumes of alcohol, d_{25}^{25} 0.8939, n_D^{26} 1.4925, 0% ketones with NaHSO₃, 9% ketones with Na₂SO₄, 0% phenols with 4.3% NaOH, $-12\frac{1}{2}^{\circ}$ C did not cause the separation of solid matter. A solution of the oil in CCl₄ was levorotatory.

GREEN STEMMED MATERIAL

Two hundred and thirty Kg of green plant material yielded 46 Gm, or 0.02%, of a dark greenish oil with an odor and taste identical with that of the oil produced from the red-stemmed material.

The constants of the oil were: 1 volume soluble in 1 to 3 volumes of alcohol; 1 volume insoluble in 4 volumes of alcohol, d_{25}^{25} 0.8959, n_D^{26} 1.4924, acid number negligible, saponification value 7.28, saponification value after acetylation 35.21, $-12\frac{1}{2}^{\circ}$ C did not cause the separation of solid matter. The optical rotation of 4 cc of oil with 6 cc of CCl₄ in a 100 mm tube was -4.18 .

Fractionation—Twenty Gm of the oil were fractionated four times under atmospheric pressure. Results are shown in the accompanying table.

DATA FOR FRACTIONS

No	Boiling Temp ° C	d_{25}^{25}	n_D^{23}	Gm
1	160-180	0.8522	1.46874	4.5
2	180-247	0.8800	1.48414	2.5
3	247-263	0.9103	1.49974	6.6
Residue				

* Scientific Section A Ph A Madison meeting 1933

¹ From the Department of Pharmacognosy and Pharmacology, University of Florida Gainesville Florida

² Professor of Botany and Materia Medica School of Pharmacy Duquesne University, Pittsburgh, Pa

Fraction No 1 was refractionated and 3 cc were obtained which boiled between 162-164°. The d_{20}^{20} was 0.8426 and n_D^{23} 1.46244. The constants of this fraction indicate the presence of sabinene. The amount of material precluded further investigation.

Fraction No 3 was treated with 70% alcohol to purify somewhat the hydrocarbons present. The residue amounting to 6 Gm. boiled at 255-259°. The d_{20}^{20} was 0.9088 and n_D^{24} 1.49584. The constants of this fraction indicate caryophyllene. Derivatives could not be obtained because of the small amount of material.

SUMMARY

The above ground portion of *Hyptis mutabilis* yields from 0.012% to 0.02% of a volatile oil, constants of which have been obtained. Oils from the red- and green-stemmed plants are evidently identical. The oil has a high hydrocarbon content and the presence of sabinene and caryophyllene is indicated.

PHYTOCHEMICAL NOTES

FROM THE LABORATORY OF EDWARD KREMERS

No 113 THE STEROL FROM PINUS SABINIANA

BY OLE GISVOLD

The nonsaponifiable material obtained by J. Semb upon saponification of the fatty oil extracted from the seed of the Digger's pine had been turned over to Kurt Bonstedt. By the digitonin method he isolated a sterol which, however, was contaminated by hydrocarbon material as became apparent in the attempt to recrystallize it. Purification of the sterol was effected by allowing it to crystallize from its alcoholic solution. The paraffin which separated with the sterol upon cooling was brought into solution by gently heating the mass for a few moments. As soon as this had been accomplished the sterol crystals were removed by suction filtration. They melted at 137.5° and the acetate melted at 127.5°.

Inasmuch as the mother liquid containing the hydrocarbon also contained some sterol, this was separated by the digitonin method. The digitonide obtained was mixed with sand and the mixture extracted with ether for several hours to remove the hydrocarbons. This accomplished the digitonide was resolved into its components with boiling xylene. The sterol thus obtained revealed the same melting point as that recorded above, the melting point of its acetate also corresponded with that given above.¹

The sterol contained in the fatty oil from the seeds of *Pinus sabiniana*, therefore, appears to be a sitosterol.

Dr. Roy Gardner closed his remarks before the Australian and New Zealand Association for the Advancement of Science (1935) by saying "Pharmacy as a field of work dealing with health has its own responsibility and a share of the general responsibility for watching the growth of science and seeing that the world makes a right use of it for the benefit of mankind."

THE VALUE OF TOLU COATING, U S P X AND N F V

BY F S BUKEY AND MARJORIE BREW *

The use of tolu as a coating for pills has been recommended for more than seventy-five years. Some of the early investigators even went so far as to employ tolu in forming the mass for phosphorus pills. They made the statement that tolu is soluble in the gastric juice and forms a more plastic pill mass. They also suggested the use of beeswax and tolu as a base for phosphorus pills. Tolu coating is also highly recommended by our present-day textbooks of Pharmacy, as well as being the official coating for Pills of Phosphorus and Pills of Ferrous Iodide.

The authors have found in making enteric coatings that tolu is resistant to the processes of digestion. This leads to the conclusion that possibly tolu coating for these official products is of little value. With this idea in mind, a study was made of tolu-coated pills to determine the percentage of disintegration in the body.

The efficiency of the tolu coating was determined by making some pills, approximately the same size as the official Pills of Phosphorus. The formula for the mass used was as follows:

Methylene Blue	1 Gm
Althea, powder	12 Gm
Acacia, powder	6 Gm
Barium Sulphate	10 Gm

A mass was made by moistening the ingredients with a sufficient quantity of a mixture of 2 parts of glycerin and one part of water. This mass was then divided and made into 200 pills.

The barium sulphate was added to the mass so that the X-ray could be used to definitely locate the position of the pills in the digestive tract. The methylene blue, by its property of coloring the urine, made possible the determination of the disintegration in cases where the X-ray was not used. The dye was also of value in determining the entirety of the coat. The dried pills were coated with tolu according to the formula given in the U S P. The reason for using this coating on Pills of Phosphorus is to form an air-tight seal protecting the phosphorus from the air. If air should come in contact with the mass of either Pills of Phosphorus or Pills of Ferrous Iodide, oxidation would take place in time, which would make the pill of little value. For this reason, it would be necessary to have the tolu coat entire. By placing the pills in water small openings might be detected by the leakage of the methylene blue. This test was made after the application of each coat until no further evidence of blue was noted. Microscopic examinations of the finished pill showed the coating to be on the average of about 0.1 mm in thickness. These determinations of thickness were made because of the fact that it might be claimed that the pills were coated too heavily. The authors are confident that the coating was no thicker than required to protect the pill. Further microscopic examinations of these coats showed that the tiny depressions in the surface of the pill would not coat as heavy as the smoother surfaces, thus making weak spots in the coat. It is the opinion of the authors that if the coat could be applied uni-

* The College of Pharmacy, University of Nebraska, Lincoln, Neb.

formly, these pills would be as impervious to water and the digestive fluids as lead shot

Some of the early investigators made the discovery that old tolu, which had lost most of its volatile oil, was better for a coating than the fresher balsam. The authors agree with this statement as the results of their experiments indicate that there was greater disintegration of pills coated with tolu which was over ten years old. This is believed to be true, because old tolu is more brittle and, therefore, cracks more easily.

In order to be certain that the samples of tolu were not of an inferior grade, the pills were coated with tolu obtained from four different sources: J. L. Hopkins & Co. (4), S. B. Penick & Co. (1), Eimer and Amend (3), Chas. Huusking and Co., Inc. (2).

The coatings were tested in two ways, by the use of the X-ray and by giving an individual one of the pills and then observing the color of the urine for sixty hours. When the X-ray was used, the subject was given six pills. Radiographs were then taken at desired intervals until the pills were excreted from the body or were disintegrated. In most cases, these experiments extended over two days. A small teaspoonful of Bari o meal in a glass of water, was given before the first radiograph was taken in order to locate the stomach. The shadow produced by this amount of Bari o meal was not heavy enough to mask the pills.

The results obtained by giving the subject a single pill, coated with tolu, purchased from (1) were as follows:

Thirty-seven subjects were used, 23 subjects were used more than once, 8 of the 23 subjects showed no disintegration. In no case where the subject was used more than once was it found that every pill disintegrated, 109 pills were given, 31 pills disintegrated. The percentage of disintegration was 28.44.

The disintegration time was as follows:

One to 5 hours, 1 pill, 6 to 10 hours, 1, 11 to 15 hours, 7, 16 to 20 hours, 3, 21 to 25 hours, 5, 26 to 30 hours, 6, 31 to 35 hours, 5, 36 to 40 hours, 1, 41 to 45 hours, none, 45 to 50 hours, 2 pills.

The X-ray experiments with (1) tolu gave the following results, with the four subjects that were used:

Subject 1, pills disintegrated, 1, excreted, 4, undetermined, 1. Subject 2, disintegrated, 3, excreted, 3, undetermined, none. Subject 3, disintegrated, 2, excreted, 4, undetermined, none. Subject 4, disintegrated, none, excreted, 5, undetermined, 1.

The following table gives the number of pills with their time and location of disintegration and the time of excretion:

TABLE I

Time in Hours	5	10	15	20	25	30	35	40	45	50
Stomach	18	13 2D ¹	5							
Small intestine	6	2	1							
Ascending colon		1D	1	12	10	3	3			
Transverse colon			1D	2D		4	1	2	2	
Descending colon						2	2	4	4	
Pelvic colon			3	3		2	5			1
Excreted				3	2	1		3		7

¹ The letter D is used to designate disintegration. The number preceding the D is used to designate the number of pills disintegrating and the number in front of the dash is the total number of pills, inclusive of the ones disintegrating in the given location, for example, stomach 5 2D.

The results obtained by giving the subject a single pill coated with tolu purchased from (2) were as follows:

Twenty-seven subjects were used, 10 subjects were used more than once, 5 out of the 10 subjects showed no disintegration. In the case of one subject, who was used more than once, it was found that every pill disintegrated, 49 pills were given, 14 pills disintegrated. The percentage of disintegration was 28.57.

The disintegration time was as follows:

One to 5 hours, 1 pill, 6 to 10 hours, none, 11 to 15 hours, 2, 16 to 20 hours, none, 21 to 25 hours, 4, 26 to 30 hours, 3, 31 to 35 hours, none, 36 to 40 hours, 2, 41 to 45 hours, 2, 46 to 50 hours, none.

In the X-ray experiments using (2) tolu, seven subjects were used and the results were as follows:

Subject 1, pills disintegrated, none, excreted, 2, undetermined, 4. Subject 2, disintegrated, 3, excreted, 1, undetermined, 2. Subject 3, disintegrated, 3, excreted, none, undetermined, 3. Subject 4, disintegrated, 1, excreted, 4, undetermined, one. Subject 5, disintegrated, none, excreted, 6, undetermined, none. Subject 6, disintegrated, 1, excreted, 4, undetermined, 1. Subject 7, disintegrated, 3, excreted, 3, undetermined, none.

The following table gives the number of pills with their time and location of disintegration and the time of excretion:

TABLE II

Time in Hours	5	10	15	20	25	30	35	40	45
Stomach	22	17-3D	6						
Small intestine	19	9-1D	1						
Ascending colon	1	13	14-1D	4	10-1D	5-1D			
Transverse colon		1	4	2	4-3D		2	1D	
Descending colon		2	1		1				
Pelvic colon			1	11	9	9	6		
Excreted					13	2	2	3	

The results obtained by giving the subject a single pill coated with tolu purchased from (3) were as follows:

Twenty-two subjects were used, 16 subjects were used more than once, 3 of the 16 subjects showed no disintegration. In the case of three subjects who were used more than once, it was found that every pill disintegrated, 67 pills were given, 35 pills disintegrated. The percentage of disintegration was 52.23.

The disintegration time was as follows:

One to 5 hours, 1 pill, 6 to 10 hours, 4, 11 to 15 hours, 3, 16 to 20 hours, 5, 21 to 25 hours, 11, 26 to 30 hours, 4, 31 to 35 hours, 1, 36 to 40 hours, 1, 41 to 45 hours, 5, 46 to 50 hours, none.

The results of the X-ray experiments using seven subjects may be tabulated as follows:

Subject 1, pills disintegrated, 4, excreted, 1, undetermined, 1. Subject 2, disintegrated, 2, excreted, 4, undetermined, none. Subject 3, disintegrated, 6, excreted, none, undetermined, none. Subject 4, disintegrated, 2, excreted, 4, undetermined, none. Subject 5, disintegrated, 2, excreted, 4, undetermined, none. Subject 6, disintegrated, 4, excreted, none, undetermined, 2. Subject 7, disintegrated, 3, excreted, 1, undetermined, 2.

The following table gives the number of pills with their time and location of disintegration and the time of excretion:

TABLE III

Time in Hours	5	10	15	20	25	30	35	40	45	50
Stomach	17-1D	8	4							
Small intestine	19-1D	6-4D	7-1D							
Ascending colon	3	11	10-1D	6	9-1D	5				
Transverse colon	2	2	3-1D	3	7-3D	4-1D				
Descending colon	1	1	2-1D	2	4-3D			3-3D		
Pelvic colon			3	1	4					
Excreted			3	4	1	6				

The results obtained by giving the subject a single pill coated with tolu, purchased from (4) were as follows

Twenty six subjects were used, 19 subjects were used more than once 5 subjects out of 19 showed no disintegration, 1 subject out of the 19 showed total disintegration, 61 pills were given, 22 pills disintegrated The percentage of disintegration was 36.65

The disintegration time was as follows

One to 5 hours, none 6 to 10 hours none, 11 to 15 hours, none, 16 to 20 hours, 4 pills, 21 to 25 hours, 7, 26 to 30 hours, 8, 31 to 35 hours, 1 36 to 40 hours, none, 41 to 45 hours 2, 46 to 50 hours, none

The results of the X ray experiments using four subjects may be tabulated as follows

Subject 1 pills disintegrated 3 excreted, 1, undetermined 2 Subject 2 disintegrated 4, excreted, 2, undetermined none Subject 3, disintegrated, 2 excreted 4, undetermined none, Subject 4, disintegrated 2 excreted 4, undetermined, none

The following table gives the number of pills with their time and location of disintegration and the time of excretion

TABLE IV

Time in Hours	5	10	15	20	25	30	35	40	45	50
Stomach	18	6	6							
Small intestine	3		4 2D							
Ascending colon	2		7-1D	11 2D	7 1D	6	1D	2 1D		
Transverse colon			2	5	3	2-1D		1-D		
Descending colon			3		1	2		1		
Pelvic colon			2	1 D	2		2	2	2	
Excreted				4	1			2	2	2

By summarizing all the experiments, the following results were found

Two hundred eighty six pills were given, 112 subjects were used, 102 pills disintegrated The percentage disintegration was 35.66

The average for the disintegration time is shown in the following table, which gives the number of pills disintegrated at five-hour intervals It will be noticed that the highest number of pills disintegrated in 21 to 30 hours, which would indicate that most of them were in the colon before disintegration took place For proper medication, disintegration should take place before the pills reach that part of the alimentary canal

One to 5 hours, 3 pills, 6 to 10 hours, 5, 11 to 15 hours, 12 16 to 20 hours 12, 21 to 25 hours, 27, 26 to 30 hours, 21, 31 to 35 hours, 7, 36 to 40 hours, 4, 41 to 45 hours, 9, 46 to 50 hours, 2

It is evident, from this data, that the further use of tolu as a coating should be discontinued, since in 64.34 per cent of the cases no medication whatever was obtained and in many cases where disintegration was obtained, it probably occurred too late for proper absorption It is therefore recommended to the U S P and N F Revision Committees that gelatin coating be substituted for tolu coating in the forthcoming revisions

The authors wish to express their appreciation to the students of the College of Pharmacy, University of Nebraska, for their cooperation in this study

SHARK LIVER OIL *

BY W S JONES AND W G CHRISTIANSEN ¹

As part of our investigation of fish liver oils as sources of Vitamins A and D we have examined the liver oils from a number of species of shark. The commercial samples have generally proved to be not only very poor in taste and color but, with one exception, inferior to cod liver oil in Vitamin A content. Estimation of Vitamin A was made colorimetrically by the antimony trichloride method, using a biologically assayed cod liver oil for comparison, and these data together with those of free fatty acid and unsaponifiable matter, are listed in

TABLE I —COMMERCIAL OILS

	Species of Shark	% FFA	% Unsaponifiable	Estimated Vitamin A
1	Dusky	0.088	2.71	645
2	Leopard	0.186	11.41	410
3	Nurse	0.059	2.79	905
4	Sawfish	0.079	4.85	168
5	Sun	0.079	5.95	4500-6000

Lack of care in the rendering of these oils may easily account for low vitamin content as well as the highly unsatisfactory odor and taste. We therefore prepared a number of oils from fresh livers, using careful, anaerobic technique in order to obtain oils with their full vitamin content, free from the putrid, very fishy and ammoniacal odor and taste observed in the commercial samples. The rendering process is as follows:

The shark liver is macerated and placed in a steam-jacketed, enameled kettle. A small amount of water is added and the mass, agitated the while, is heated to boiling. The boiling is continued 20 minutes with intermittent stirring. The tissue breaks up readily and, when the steam is shut off and the mass cools, settles out, leaving a layer of oil which is easily removed. The oil is mixed with a filter aid and filtered. As before stated, air is excluded, the oil being protected by an inert gas throughout the process.

The following data were obtained on the oils produced in the manner described above:

TABLE II

Sample No.	Species of Shark	Color of Oil	% FFA	% Unsaponifiable	Vitamin A Colorimetrically Estimated	Vitamin A Biologically Determined	Vitamin D Biologically Determined
1	Nurse	Yellow	0.28	1.69	868		
2	Sawfish	Reddish yellow	0.42	3.00	3400	2222	14
3	Sand	Water-white	0.16	9.6	200		
4	Leopard	Orange	0.16	12.4	3080	2700	<14
5	Nurse (male)	Yellow	0.28		400		
6	Nurse (female)	Yellow	0.84		400		

In each instance one whole shark liver was rendered. The livers vary in weight from 15 lbs. for No. 5 to 55 lbs. for No. 2. The yield of oil was, of course, lower than would be obtained

* Section on Practical Pharmacy and Dispensing, A. Ph. A. Washington meeting, 1934.

¹ Research Department of the Chemical and Pharmaceutical Laboratories, E. R. Squibb and Sons, Brooklyn, N. Y.

by a solvent extraction method, but in every case was better than the normal recovery from cod livers. The lowest yields, 48.6 and 51.7% were obtained on the two smallest livers, Nos 5 and 6, the other Nurse liver, however, weighed 36 lbs and yielded 66% of oil. The largest liver, No 2, gave a yield of 55.3%, and the highest yield, 70.8%, was obtained on No 4, which weighed 43 lbs.

When these oils were tested colorimetrically for Vitamin A it was found that those from the Sawfish and Leopard species gave much higher values than any of the others, whereas the commercial samples from those two species had given the lowest values. When assayed biologically the specially prepared Sawfish and Leopard oils gave Vitamin A values of 2222 and 2700 U S P X units, respectively, and the cod liver oil control showed 1566 U S P X units. The two shark liver oils were therefore 50-80% stronger in Vitamin A than cod liver oil.

While two of the shark liver oils proved to be considerably more potent than cod liver oil with respect to Vitamin A, they were only one-tenth as strong in Vitamin D, each having about 14 Steenbock units as against 134 in the cod liver oil.

These carefully prepared oils were all free from any putrid or ammoniacal taste or odor, and had only a slight natural fishy taste. They all deposited stearine on standing at room temperature.

SUMMARY

1 Commercial samples of liver oils from the Dusky, Leopard, Nurse, Sawfish and Sun sharks were tested colorimetrically for Vitamin A.

2 Oils were prepared from the fresh livers of Nurse, Sawfish, Sand and Leopard sharks and were tested colorimetrically for Vitamin A.

3 Oils from the fresh livers of Sawfish and Leopard sharks were assayed biologically for Vitamin A and D.

THE PROBLEMS* OF THE TEACHERS AND STATE BOARD EXAMINERS¹

BY HARRY W. MANTZ²

The Teachers of Practical Pharmacy and Dispensing will no doubt agree that the scope of their subject is gradually changing and becoming more complicated. Many causes might be cited, but two of the outstanding are: First, the limited amount of practical drug store experience possessed by the individual when he enters the Pharmacy School and when he appears before the State Board Examiners to prove that he is qualified to practice the profession of Pharmacy, *second*, the large number of new preparations put on the market and the lack of knowledge, concerning these preparations on the part of the physician, the pharmacist and the teacher of pharmacy.

* Of Practical Pharmacy and Dispensing

¹ Section on Practical Pharmacy and Dispensing, A. Ph. A., Washington meeting, 1935

² Associate Professor of Pharmacy, Director of the Pharmacy Laboratories, Temple University

The State Boards are gradually decreasing the amount of practical experience necessary to meet their requirements. The result being that it is now necessary for the teachers to supply the training in the school which was heretofore obtained in the drug store. Our forefathers learned the profession by applying one of the basic laws of learning—"Learn by Doing," no one will deny that this is the most efficient way of learning. Is it possible then for an instructor to supply this demand in the comparatively short time allotted?

The teacher of practical pharmacy and dispensing does not find it a burden to teach the processes and procedures for the manufacture of the U S P and N F compounds and preparations. The pharmacist, however, is not only confronted with these, but with hundreds of others and combinations of them. This being the case it would seem necessary for the teacher to include instruction on these new preparations in order to accomplish that which is expected of him—to prepare the student to practice the profession of Pharmacy and meet the State Board requirements. The question then arises, if the new preparations are considered, at what point should the instruction end? It was pointed out in a paper presented at a meeting last year that nearly four million combinations are possible—to be obtained from one hundred drugs with four in a prescription. This proves that it is not possible for the teacher to give instruction on all the compounds and possible combinations, but only on the basic principles underlying the art of compounding and dispensing. This can best be accomplished by giving the student work which runs parallel to that carried on in the laboratories of the drug stores.

The examiners are also confronted with difficult problems and a good idea of these can be obtained by reading the proceedings of the joint meetings of members of the State Boards of Pharmacy and delegates of the American Association of Colleges of Pharmacy. Briefly, they are as follows. First, "How many and what type of preparations and prescriptions should be given in order to determine how much the applicant knows?" Second, "How many times should the applicant be allowed to make the preparations or compound the prescription?" Third, "What method should be used for grading the preparations and prescriptions?"

These questions have been discussed and no definite agreement has been reached, although the problems are of utmost importance. The teachers of *Materia Medica* have submitted a definite list of drugs, on which the examinations are to be based and, likewise, if the examiners and teachers of practical pharmacy were to cooperate, plans for uniform examinations could be made. It is realized that a definite list of preparations would hardly be possible, therefore, the suggestion for uniform examinations.

The aim of the examiner should be to find out what the applicant knows and not what he does not know. This is best accomplished by giving a comprehensive examination. Therefore, the more preparations and prescriptions given, the better it would be for both the examiner and the candidate. Four preparations or prescriptions are not sufficient to determine the qualifications of the individual, ten would seem a more satisfactory number. The type of preparations, the number of chances given to the individual to make the preparation, or compound the prescription and the method of grading are inter-related.

Most State Boards allow only one chance to make the preparation, providing this rule is followed. This suggestion is offered—that sixty per cent of the examina-

tion consist of U S P and N F preparations with the directions for manufacturing given. It is only fair to give the applicant the same privileges which the pharmacist has in the drug store. If the directions are given and he has acquired the proper technique, he should be able to make a preparation the first time with perhaps the exception of emulsions. This would give the applicant a chance to make a grade of sixty per cent and the remaining forty per cent should consist of work on prescriptions, without directions given. In the writer's opinion, it is not fair to expect an odd prescription to be compounded correctly the first time, and in order to be fit for dispensing, it should be perfect to the degree which is possible. The prescriptions given in examinations often consist of odd combinations on which a certain amount of experimentation had to be done to ascertain the best method for compounding. This, no doubt, suggested the idea to the examiner that it would make a good State Board question. Why expect more from a man with a limited amount of experience than from the one who has had at least ten years? In many cases no basic principles are demonstrated in these combinations.

One point which the State Boards overlook, as far as the writer has been able to determine, is the applicant's ability to read original prescriptions. It would seem more important to be able to read a physician's handwriting and decipher a prescription, than to identify drugs. This could be made a part of the work on dispensing prescriptions in the examination. The remainder of the examination should consist of determining whether the candidate is qualified to handle a prescription from the time he receives it until it is ready to be handed to the customer. Every one present is acquainted with these proceedings without taking the time to enumerate them. If the candidate is not capable of making fifteen per cent on the remainder of this work, which will give him a passing grade, he is not qualified to receive a certificate of registration.

PROFIT—THE WAY OUT OF THE DEPRESSION *

FOR THE NATIONAL RECOVERY ADMINISTRATION

BY W. BRUCE PHILIP

To protect the consuming public the prices of drugs, medicines, toilet articles and drug sundries, must be at such a price level as to allow adequate pharmaceutical service.

A code of Fair Competition, for the retail drug trade, must be a guide, not for a few exception drug stores, but for at least ninety per cent of the 60,000 drug stores in the 48 states. This ninety per cent of the total number of drug stores serve at least ninety per cent of the geographical territory of the United States. This same ninety per cent of the drug stores serve at least seventy-five per cent of the country's population. If the Code of Fair Competition for the Retail Drug Trade will not bring recovery to the ninety per cent of the retail drug trade, the code then ceases to be a Code of Fair Competition for the Retail Drug Trade, and becomes a special code for a favored fraction of the retail drug trade.

* Section on Commercial Interests. A. P. H. A. Washington meeting, 1935.

The laws of every state in the Union, and the District of Columbia, demand that "drugs" be sold by registered pharmacists. One finds mention in the Code to "registered pharmacists," "assistant pharmacists," and "apprentice pharmacists." This imputes at once the handling of drugs by highly skilled persons. The Code for the Retail Drug Trade of course recognizes that persons other than retail clerks are necessary for drug stores.

It is also self-evident that on account of these stringent State and District of Columbia pharmacy laws, that if a drug store has only one employee, and he is left alone in the drug store, that person must be a registered pharmacist.

All this points toward the fact that in smaller retail drug stores a minimum code wage is not apt to be a maximum drug store wage, unless the Fair Trade provisions are inadequate, and fair wages cannot be paid. In larger drug stores where greater supervision is possible, and work of the drug store can be segregated and delegated as routine work, work wherein only limited knowledge is required, a large number of minimum wage workers may be possible. A low overhead thus obtained should not control 90 per cent of the drug trade industry.

It must at all times be remembered that *all* fair trade provisions must be important and necessary factors and will control the selling power of all drug store items, controlled by the Code. These provisions must not create an undue hardship on items needed by the consuming public for the protection of health. No item must be placed by provision of the Code, so low that other items will be unduly high in price.

No item can be sold from a drug store without certain fundamental charges entering into the "cost" to the public of the item sold. If these charges do not enter into the sale price, the sale is not an honest sale. It must be remembered that where the burden of the expense of selling one item is not to be found in the cost of that item to the public, then that burden of the selling of that particular item must be added in the cost of another item, or several items. The public must pay the cost of handling all items.

The following figures make clear just what is meant. Figures easily seen at a glance have been chosen.

A drug store's overhead is arbitrarily placed at 30 per cent. By overhead is meant the service furnished by the retail druggist, and includes such items as labor (clerk hire), rent, taxes, etc.

To illustrate, let us say four items, *a*, *b*, *c* and *d*, are purchased, all different, each one of the four costing seventy cents. If each item is sold for one dollar, the consuming public pays the merchant the manufacturer's wholesale price for the item, plus the fair share of operating expense needed to buy (house) and sell these four items.

But if one item, *a*, is sold at 70 cents retail (this is according to the Code of *Fair Competition* for the Retail Drug Trade, definition of "cost") to pay the wages, rent, taxes, etc., that make up the 30 cents overhead on the item, *a*, there is a choice of spreading the 30 cents needed to see, *a*, over *b*, *c* and *d*. Shall the price of *b* be raised to \$1.30 when it is already carrying 30 cents, its full share of wages, rent, taxes, etc., or shall *b* and *c* be raised to \$1.15, or shall *b*, *c* and *d*, be raised to \$1.10 each?

It may be asked what is fair in an alleged "Fair Trade Practice" provision that

allows this unfair practice? Remember this illustration does not allow one cent of net profit

If, *a*, *b*, *c* and *d*, are purchased by different people, whom should these people overpay so one can buy an underpriced item? Why gyp three-fourths of the consuming public?

The NRA should tell the public and stand firmly on the fundamental truth, that if the consuming public is to have drug stores and drug store service, then the consuming public must pay the overhead expenses, must pay the profit that goes into giving adequate protection needed to sell the items peculiar to this Code

When a drug store opens its door each morning, out of sales alone, labor, rent and taxes must be paid. The more items sold at cost, the lower must be the wages and the more unfair to the consuming public must be the price on other items sold

Surplus, excess stock of goods on hand, and credit once possessed to a degree by the retail druggist, has been exhausted by four years of depression

The consuming public has received all this reserve the 60,000 drug store owners once had. Much of the credit exhausted by the corner drug store owner during the last four years went to the unemployed, and to those whose purchasing power was greatly reduced, and is a debt the consuming public can pay by demanding a fair code provision for the retail drug trade, instead of demanding sales without profit

The issue, therefore, must be squarely faced that since surplus excess stock and credit can no longer be counted upon by the drug trade, to-day's drug store profit in sales must now be considered exclusively to pay labor, wages and taxes. Wages paid to drug clerks and other employees at once become consuming public purchasing power

If "recovery" is to come to 90 per cent of the owners of retail drug stores in the United States, under the National Industrial Recovery Administration, the National Recovery Administration and the Code of Fair Competition for the Retail Drug Trade, present-day sales must represent three things, namely, Cost of Merchandise, Overhead and Net Profit

Net profit, if made on sales to day will be used by the retail druggist for a long time to come, to pay bills, and debts accumulated during the past four years of depression, debts that are, respectively, labor charges, rents and taxes, paid after the surplus and reserve were exhausted, now existing largely in debt to manufacturers, and wholesale drug houses

It must be admitted by all, that if *sales* now made do not pay Cost of Merchandise and Overhead, then bankruptcy stares the members of the drug trade in the face, and lack of adequate drug service will become a consumer's problem

If cost of merchandise and overhead are not carried by cost, is not then the Code for the Retail Drug Trade demanding that the druggist fail to pay his employee, fail to pay his rent, fail to pay his taxes, or fail to pay for his merchandise?

Failure to pay for either overhead or merchandise is not in the consumer's interest. It is not in a recovery program. Without profit, purchasing power of dependent employees is slowed up or stopped, and unemployment increases

Alleged efficiency in business cannot be the subterfuge to place *unfair* competitive provision into the Code of Fair Competition of the Retail Drug Trade

When the retail druggists hire labor they cannot go into the household or personal living efficiency of the employee, and thus set a lower wage level

If an employee owns his own home, or has his own orchard, or garden, or if the employee can buy his provisions in large quantities or can make his own clothes, the employer cannot take these things into consideration and pay a wage below the minimum even if the saving is passed on to the consuming public

The Code of Fair Competition for the Retail Drug Trade is for 60,000 drug stores, and unfair trade practices should not be written into it, because a few druggists own their own buildings, or have an advantage in buying, which if allowed to influence the Code provision, will injure a large number of drug stores

The fact must never be lost sight of that alleged efficiency means, keeping down overhead, and the consuming public must know just what keeping down overhead means

The largest item in overhead or expense is labor Therefore, alleged efficiency is making minimum wages, maximum wages Efficiency means, immediately laying off help that may not be needed, and seeing that the number of employees are kept at the minimum Alleged efficiency means, discharging an employee immediately when he shows signs of failing to produce maximum results under minimum wage conditions

Controlling over 90 per cent of the drug business by an alleged efficiency of the less than 10 per cent of the 60,000 retail drug stores, is to repudiate the Declaration of policy, Section 1, of the National Industrial Recovery Alleged efficiency is taking advantage of every employee so that the largest expense item in a store's overhead will be kept down

Consider that during the last four years of depression, workers had no minimum wages Clerks repeatedly in cut-rate stores, took anything for a job Is it surprising that less than ten per cent of the 60,000 drug stores now can show an alleged efficient low overhead made so by a low wage?

Every dollar that helps to improve industry comes out of profit—that is, a sale or service price above cost of goods or materials

Why dodge the issue, why lie about it? A sale without profit is without honor under any code A sale without profit is a direct slap at the unemployment problem

The codes, and the NRA prohibited the employment of labor without the payment of wages Why have not the NRA, and the code provisions, placed a "sale" on an honest basis like a minimum wage? That honest basis is not an honest definition of cost alone Trading dollars never paid a cent of wages to the labor needed to make the swap

To demand that purchasing power be increased before profit is made, is ridiculous It is not a question of which comes first, the hen or the egg

What happened ten million years ago is not being discussed, we are talking about what will happen now Believe it or not—without a hen, you have no egg Without a profitable sale, there is no means to pay the employee Without profit there is no purchasing power, and as profit becomes fair, purchase power rises from the minimum

When 90 per cent of the retail drug trade by official representation in September 21, 1933, asked the NRA for a code, a demand for a fair profit was made also This demand has been repeated almost daily since that time

Ninety per cent of the retail drug trade cannot be wrong when it comes to

knowing what the retail drug store needs, so that employment can be increased and purchasing power can be raised

Ninety per cent of the retail drug trade cannot be wrong when it comes to knowing what are fair and unfair trade practices in the retail drug business

Among all the people of the NRA that have opposed the giving of fair profit over cost to pay labor, rent and taxes, not one person is known to the speaker who is qualified as a pharmacist What American principle is it that allows a few untrained officials to retard an industry that speaks ninety per cent strong—an industry that holds a good share of the public health of 125,000,000 people in their keeping, and have followed a fair trading policy and service here in America, as long as we have had a nation?

REVOLUTIONARY ACCOUNT BOOK OF CHRISTOPHER, JR, AND CHARLES MARSHALL

BY CHARLES H AND MILICENT R LAWALL

The Marshall Drug Store, which was one of the prominent pharmacies of Colonial America, was founded in 1729 at Front & Chestnut Streets, Philadelphia, by Christopher Marshall, Sr, who had been born in Dublin, Ireland, and who had first settled among the 'Friends' of Bucks Co, Pennsylvania, where he became a member of the Middletown Monthly Meeting In 1735, the store was moved to Chestnut Street above Second Street (now the site of 214 Chestnut Street), where it continued for more than a century at "The Sign of the Golden Ball"

Christopher Marshall, Sr, was a "fighting Quaker," who was prominent in Colonial as well as civic affairs In 1765, he took in with him as his partners, his sons, Christopher, Jr, and Charles, and they succeeded to the business in 1772 Charles Marshall, the active head of the new firm, was an apothecary, druggist, botanist and

chemist, who developed a fine reputation among the leading physicians of the city for his integrity, skill and care He became, in his old age, the first president of the Philadelphia College of Pharmacy, in the archives of which the book was found which furnishes the subject of this study

It is a typical "Day Book," about 8 by 12 inches in size, bound in a cardboard cover, with a typical mottled design of scallops of red, white, green and blue (see Fig 1) It bears an oval label on which is written

"Waste Book, Chris Jr & Chas Marshall Began June 1st, 1774 Ended Septem 10th, 1774 No 5"

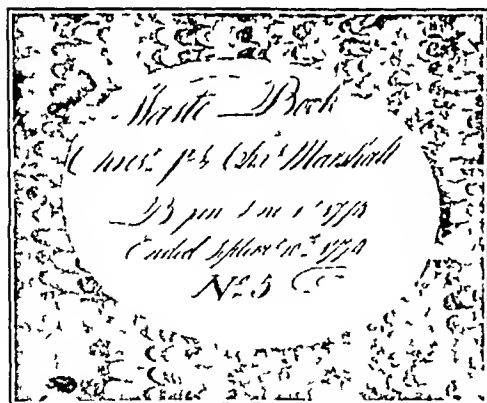

Fig 1—Upper part of cover of Waste Book

"Jacob Fetter, sent by Shank's wagon " (Was this wagon drawn by the original Shank's marc?)

"James Claypoole, delivered to his lady "

"Emanuel Holmes, one vomit, 9 pence "

"A mixture, secundum recipe, delivered by John Day's post "

"Charge against Pritchard—married Widow King "

"Aug 6, Bought 3 cords wood for $\frac{3}{4}$ "

"Delivered by stage driver to Princetown "

"To Capt James Weir to sundry medicines to wright (sic) his medicine box and for grinding a lancet "

We find that Dr Chovet was an almost daily customer Dr Abraham Chovet was a famous physician of Colonial times, who was born in England, educated in Edinburgh, and became a demonstrator of Anatomy to the United Company of Barber Surgeons He later settled in Jamaica, from whence he was driven by a slave insurrection He settled in Philadelphia in 1770 and lived on Race Street above Third He remained an irreconcilable Tory during the Revolution, and yet retained both friends and practice, gave private lectures in physiology and anatomy, and died in 1790, both honored and respected Dr John Morgan, whose name is well known to medical and pharmaceutical historians, and who then lived at Second and Spruce Streets, was a frequent customer, mainly for paints, during the period covered by this book

Another famous customer, whose name appears several times was Christopher Sower, the Germantown printer, who published the first Bible in America and one of America's earliest newspapers—*The Germantown Gazette*

Let us now look at a few of the pages produced in facsimile

Illustration No 1—speaks for itself

Illustration No 2—This page is concerned with items of pharmaceutical interest sent to Dr William Rumney of Alexandria Note the now obsolete name of the first item "Sachar Saturn" for lead acetate Also the second item, the Theriac of Andromachus, which was just about completing its second millenium, but which has now disappeared entirely from use Space and time forbid the detailed discussion of all of the items They are all worthy of detailed consideration by those who have the time and inclination On the following page where this order is completed, we find "Ivory Glyster (sic) pipes," "ivory syringes" and "Crown lancets in a shagreen case "

In *Illustration No 3* we find a number of miscellaneous items that require no explanation This is also true of *Illustration No 4* In *Illustration No 5*, we again encounter a page of items of pharmaceutical interest This is part of an order which was evidently intended for the complete outfitting of a store or a physician's office—probably the latter For this was in the days when physicians had their own dispensaries The name of the customer is Dr William Tillinghurst, but unfortunately the first two pages of this particular order were on the missing leaf, which had been cut out of the book at some time in the past There are five pages of the order remaining, however, of which the third page is produced The cost of the order totaled one hundred and twenty-four pounds, four shillings and ten pence We shall make no detailed comment on the items on this page, except to call attention to the fact that the concluding items at the bottom of the page are all proprietaries, of which there are a number on the next succeeding page At some

future time we may contribute another paper commenting particularly upon the pharmaceutical items in the entire book

In conclusion we would like to call attention to the prices of some of the items which are still in use to-day Calomel cost 30 shillings a pound, Lunar caustic, 20 shillings an ounce, there were three grades of Peruvian Bark, ranging from 20 shillings a pound up to 8 shillings an ounce, mace was sold at 32 shillings a pound and Alexandrian senna brought 8 shillings and sixpence a pound

SECOND NOTICE FROM THE COMMITTEE ON TRANSPORTATION

Members from the eastern states attending the 1935 meeting will naturally travel through Chicago, St. Louis or New Orleans in the United States, or by one of the Canadian lines, and very attractive excursion rates will be in effect, allowing the going and returning journeys to be made by different routes, if desired

There is a large number of routes that may be used for either the going or returning journey, of which a few are as follows

- 1 Through Chicago, Minneapolis and Glacier National Park, with stopover
- 2 Through Chicago, Minneapolis and the Canadian Rockies, with stopovers

A special Chicago party is being arranged to take a combination of routes 1 and 2, which members from other sections are invited to join. Inquiries about this party should be addressed to Prof. E. N. Gathereau, 701 South Wood Street, Chicago, Illinois, the Chicago member of the Committee on Transportation

- 3 Through Chicago *via* Yellowstone and Rainier National Parks, with stopovers if desired

- 4 Through Chicago or St. Louis *via* Denver, the Royal Gorge, Salt Lake City and San Francisco, with stopovers as desired

- 5 Through Chicago or St. Louis *via* the Grand Canyon, Los Angeles and San Francisco, with side trip to San Diego at small extra expense, if desired

The excursion fares for this season have not yet been announced, but it is expected that they will be about the same as for last year, when they were as follows from several widely scattered leading cities: New York \$126.90, Boston \$133.25, Philadelphia \$122.85, Washington \$120.75, Atlanta \$112.80, Cleveland \$101.35, Detroit \$98.30, Chicago \$86.00, St. Louis \$85.00. Pullman charges are to be added to these fares, with no surcharges west of Chicago and St. Louis

Nine- to twelve-day cruises from Seattle to Alaska will be available at \$85.00 and up, for fare, stateroom and meals. More information about these Alaska cruises and further details will be given in later notices

T. J. BRADLEY, *Chairman*

PHARMACY WEEK IN PHILADELPHIA

Quoting in part from the report of the *P. A. R. D. Bulletin*: Like all other weeks, the week set aside for depicting "Pharmacy of Tomorrow" has come and gone, but unlike most other former celebrations, it will leave impressions and results in activities for years to come. This work was planned by Chairman Anton Hogstad, Jr. and all the members will benefit in proportion to their application of the information in their own business. Those who attended were delighted with the exhibits

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS
DEPARTMENT

HOW SHOULD FUNDAMENTAL COURSES IN CHEMISTRY BE TAUGHT IN A COLLEGE OF PHARMACY?

BY ERNEST LITTLE *

Is there such a thing as pharmaceutical chemistry? Is there such a thing as agricultural chemistry? Are these not special applications of the general science of chemistry? If so, should not our fundamental courses be taught by men who are specialists in their fields rather than by individuals who are able to add a few special applications to the special field for which the student is preparing? Your Editor believes that the fundamental courses in chemistry for pharmacy students can best be taught by those who had training in and full appreciation of the science of pharmacy, provided they are thoroughly grounded in the phase of chemistry they are teaching

Chemistry has developed so rapidly that it is almost impossible to find an individual who is a specialist in more than one narrow field. It is far better to have our pharmacy students taught the fundamental courses in chemistry by specialists in each branch than that they be taught by pharmaceutically trained individuals who have only a general knowledge of chemistry. The happy combination is secured when we have a pharmaceutically trained teacher who is also a specialist in the branch of chemistry he is teaching.—C B JORDAN *Editor*

A few weeks ago Dr Glenn L Jenkins, chairman of the Committee on Chemistry for the Colleges of Pharmacy and Boards of Pharmacy of District No 2, requested me to present a paper at the March meeting of these two groups. In accordance with his request I read a paper entitled "How Should Fundamental Courses in Chemistry Be Taught in a College of Pharmacy?" Following the meeting Dr Jenkins stated that he thought the paper should be presented at this meeting and suggested that I send a copy to Secretary Jacobs for his consideration. Having learned to respect the judgment of Dr Jenkins, I again acted upon his suggestion and was requested by Dr Jacobs to present the paper at this meeting. Although it is substantially the same as presented at Baltimore, a number of changes have been made in order to make it more appropriate for presentation to this group.

Following this introduction, which perhaps places altogether too much of the onus for the presentation upon the broad shoulders of one of my respected colleagues, I am prepared to present the question to you for your consideration and discussion.

May I call to your attention that the title of my paper is expressed in the form of a question, rather than a positive statement. "*How Should Fundamental Courses in Chemistry Be Taught in a College of Pharmacy?*"

At our Madison meeting last August, C J Klemme of Purdue University presented a short paper entitled "Why Organic Chemistry Should Be Taught in the School of Pharmacy." During the presentation of his paper, Mr Klemme stated

"There are some things a pharmacy student should be taught that are not emphasized in general chemistry. The reason for the U S P caution about ether for anesthesia will be plain if an instructor in organic chemistry discusses the formation of peroxides and their possible effects

* New Jersey College of Pharmacy

Discussion of chloroform would explain its decomposition into hydrochloric acid and phosgene and the use of ethanol as a negative catalyst, also why chloroform for anesthesia is made from chloral. The author feels that wherever the physical set-up of the school makes it possible, organic chemistry should be taught to pharmacy students in the school of pharmacy by an instructor who has been graduated from pharmacy."

I quote Mr. Klemme at some length in order to present just the opposite point of view from that which I hold. I am not particularly interested in where a fundamental course in chemistry is presented. That is not a matter of paramount importance. I am, however, vitally concerned about how these fundamental chemistry courses are presented and the training of the individuals who present them.

I quite agree with Mr. Klemme that the important applications of organic chemistry which he mentions, and, of course, thousands of others of equal importance, should be brought out and adequately stressed somewhere in the pharmacy course, but why try to crowd them into a course in organic chemistry? Is this not the very material from which we should construct our courses in organic pharmaceutical chemistry? Will not more of these important applications be made in materia medica and in manufacturing pharmacy as well? Most colleges of pharmacy can afford no more than three hours of class-room work a week in organic chemistry throughout one college year. Those of us who have taught organic chemistry know that is hardly enough time to present a fundamental course which is adequate to serve as a foundation upon which other more specialized courses may build. Under the best conditions, this foundation cannot be made as broad as we would like to have it, but we can see to it that what we do complete is as firm and strong as possible. Infiltrations of practical applications may make it more diversified, perhaps somewhat more interesting, but certainly weakness, rather than additional strength, will result. I think there is a great deal of wisdom in President Butler's definition of the specialist when he says: "A specialist should be a broadly educated man, sharpened to a point."

Not only are there many fundamental principles to be presented but their inter-relationships must be definitely and clearly established. Similarly, parallelisms between organic and inorganic chemistry must be pointed out in order that all the fundamental chemistry courses may be properly coordinated and adequately linked together, thus collectively offering a strong and as adequate a foundation as possible. All professional, technical and applied courses will send deep roots into this foundation and from it their sustenance and building materials are obtained. We cannot expect an adequate, useful, super-structure unless our teachers of professional subjects have been provided with an adequate foundation upon which to build, and unless they also know how to make full use of the materials which have been furnished them.

For example, it is essential that in our courses in general chemistry the students be acquainted with the fundamental principles of hydrolysis. This is, of course, done in all schools. We bring out as clearly as possible what the process of hydrolysis consists of and why the three conditions of (1) large volume, (2) low acidity and (3) high temperature, may be essential to a successful hydrolytic reaction. I doubt the wisdom, however, of taking time to point out to students in general chemistry the important application which is made of this fundamental principle.

in the basic acetate separation of iron, chromium and aluminum in the presence of phosphates. If more time is available, it might rather be spent in further stressing the fundamental principle, leaving the many important applications to be brought up later, as they will be, in their appropriate places. Qualitative analysis is nothing more than an application of general chemistry. The student of qualitative analysis learns very little, if any, new chemistry. If general chemistry has been taught in an applied manner, I fear the teachers of qualitative analysis and of applied and professional subjects will find their work greatly handicapped by an ignorance of fundamentals on the part of their students.

On the other hand, when the student is studying the preparation of a solution of aluminum subacetate, as outlined in the N. F. V., the fundamental principles of hydrolysis may well be briefly reviewed and the student made to understand that the concentration of acetic acid here recommended is such as to stop or tremendously slow down the hydrolysis when the salt $\text{Al}(\text{OH})(\text{C}_2\text{H}_3\text{O}_2)_2$ is formed, instead of allowing it to continue until the less soluble $\text{Al}(\text{OH})_3 \cdot \text{C}_2\text{H}_3\text{O}_2$ is precipitated, as is the case in the basic acetate separation of iron, chromium and aluminum. The student will also understand why it is that this solution of aluminum subacetate gradually becomes turbid as it is allowed to stand and the greatly retarded hydrolytic reaction slowly proceeds, forming a more basic and hence less soluble salt.

In presenting the Solubility Product Principle, as is done by all teachers of general chemistry, it is not at all necessary that its application in qualitative analysis, showing why cadmium sulphide will dissolve in hydrochloric acid whereas the less soluble copper sulphide will not, be even mentioned.

Again, however, in the preparation of syrup of calcium iodide, after having dissolved the iron wire in an aqueous solution containing iodine, the iron is oxidized to its higher valence before removing it by the addition of portions of precipitated calcium carbonate. This oxidation is carried out because an examination of the solubility products of ferrous carbonate and ferric hydroxide shows that the syrup will contain smaller traces of iron if it is removed by precipitation after oxidation to a valence of three. The rather pronounced evolution of carbon dioxide in this preparation may be pointed to as an evidence of the hydrolysis of ferric carbonate to ferric hydroxide, or a highly basic carbonate, and also as a reason why the precipitation of the ferric iron proceeds as rapidly and completely as it does in spite of the fact that there is so little difference in the solubility products of calcium carbonate and ferric hydroxide.

We see, therefore, that there is a great deal of fundamental chemistry in as simple a process as the preparation of Syrup of Calcium Iodide. It is, however, not essential that this preparation be even mentioned when hydrolysis, oxidation and solubility products are being discussed in the course in general chemistry.

As to the individual who should teach these fundamental courses, my chief concern is that he should be a person fundamentally trained in chemistry. If he be a teacher of organic chemistry, he should have a thorough grasp of the whole field of organic chemistry. He should have a tremendous reserve of the subject as a background, which he is not compelled to draw upon in his every-day, class-room work. An individual so grounded, who is also a graduate pharmacist, should prove to be a very successful teacher of this subject. It seems to me to be more essential that teachers of professional and technical courses should have a profound knowledge of

the fundamentals upon which their specialties rest than that the teachers of fundamental subjects should have in mind all the important and useful applications which their subjects make possible

I sincerely hope that my presentation has not sounded arbitrary or uncommensurate. I realize that there are two well-defined schools of thought in this connection. I realize also that there possibly is no particular task which cannot be well done in more than one way. Who, then, is to say that *this* method of procedure is *the* best?

I have tried, however, to present my ideas as concretely and definitely as possible in order that they may serve as a basis for your consideration and discussion. The point involved is not a minor one. It is of fundamental importance. It is not so long ago that many schools, which are now members of this association, were giving minimum two-year and in some instances part-time, three-day-a-week courses in pharmacy. Under such conditions the question which I am now discussing did not exist. There was not time enough available for the presentation of either fundamental courses in science, or strictly technical and professional subjects. Nondescript combination courses were given, because they were the best that could be formulated under the then existing conditions.

Now, however, conditions have changed. We adopted the three-year course and then the minimum four-year course leading to the Bachelor of Science degree. With twice as much time available, should we simply devote twice as many hours to the same type of courses, or should a fairly distinct line of cleavage appear between the fundamental science courses on the one hand and the professional and technical courses on the other? My answer is that the latter procedure seems preferable.

I, of course, realize that one of the most fundamental principles of good teaching is to present a course in as interesting a manner as possible. I do not object to the *judicious* use of applications in a fundamental course in science. Good pedagogy must be served in a variety of ways and is very properly promoted by various devices and procedures. This concession, which is most willingly granted, does not, however, confuse the issue at stake or detract from the general principle for which I am arguing. I conclude, as I started, with the query "How Should Fundamental Courses in Chemistry Be Taught in a College of Pharmacy?" I am sure you have some decidedly worthwhile ideas on this subject.

Teachers of botany will find much to commend in the following paper presented by Professor C. C. Albers. The thoroughness of presentation of this phase of the work can easily be extended to other parts of the plants used in medicine and thus make the course in botany a splendid foundation for pharmacognosy.—C. B. JORDAN, *Editor*

THE BOTANY COURSE AS A FOUNDATION FOR THE PHARMACOGNOSY OF STEM AND BARK DRUGS

BY C. C. ALBERS

In taking up the study of stems in a botany course, one must, of course, distinguish between aerial stems and underground stems, of which there are several types. One of the chief difficulties of and causes of confusion to the beginning botany student arises in the attempt to distinguish between underground

stems and roots, a difficulty no doubt arising from the common conception that all underground parts of the plant are roots. Nor are aerial stems always evident to him, as in the case of the prickly pear (*Opuntia* species), for example, in which case the real stems are regarded as leaves, another error very likely arising from the popular conception.

Hence, in the first place, it becomes necessary to distinguish between roots and stems, since so many of the important plant drugs consist of underground stems and roots. The differences between these two types of plant organs should then be emphasized as regards the following features. The location of the growing point, the manner of branching, the origin of the branches, buds and leaf scars, the functions of each, and finally the internal or microscopic structure of each. The majority of these differences can be pointed out in the field or in the laboratory, where representative specimens of each may be selected from the stock of drugs. A microscopical examination of longitudinal sections of root tips and stem buds will reveal the difference in location of the growing points.

So far as the underground stems are concerned, the outstanding characteristics of the four types, namely, rhizomes, corms, bulbs and tubers, should be pointed out. A textbook definition of each will scarcely be sufficient. Representative specimens of each (selected from official drugs as far as possible) should be chosen for study. In the case of rhizomes, the leaf scars and bud scales on the surface should be pointed out, as well as the rootlets on the lower surface. Johnson grass, Bermuda or Couch grass rhizomes exhibit these features excellently, as well as the jointed nature of the monocotyl type of stem. The official iris rhizome and ginger rhizomes show the irregular structure of the underground stem and also the numerous root scars (especially of iris) on the lower surface.

For the study of bulbs, the common onion, garlic or even the squill bulb may be used. The outer papery membrane of these, the fleshy scales enclosing the buds, and the roots growing from the lower end should be emphasized. The corm, on the other hand, though it is likewise enclosed in a papery membrane and is erect, short and thickened, does not consist of thick, fleshy scales, but is solid and more flattened from the top to bottom. The attention of the student should be directed to the symmetrical nature of both these types and contrasted with the lack of symmetry of the rhizomes and tubers. Since only one official drug consists of a corm and it is not readily obtainable in the unsliced form, the ordinary gladiolus or crocus corm from the flower shop can be utilized.

As an example of a tuber, perhaps no better type can be found than the common Irish potato. It would be better to have an entire Irish potato plant with the tubers attached to show the manner in which the tubers are attached to long slender rhizomes. The buds or "eyes" should be carefully examined and the terminal and lateral buds noted, as well as the outer corky layer and the rows of vascular bundles internally. Finally, some scrapings from the fleshy part of each of these underground stems should be examined microscopically and the large amount of storage material in the cells noted.

So far as the microscopic structure of the stem is concerned, it would appear that this study would be even more important than the gross anatomy. Whereas the student may understand that the bark of a stem is that portion which he can "peel" off, yet without a knowledge of the structure he will have no conception

as to what constitutes a bark, no knowledge as to what plant elements are present or of the distribution of these in the bark. Nor will he understand without it just why the bark peels off so readily from the rest of the stem. Furthermore, a knowledge of the tissues present in the entire stem and their distribution will enable the student not only to understand better its functions and its general make-up but also to anticipate the elements to be encountered in examining the stem drug in powdered form. Again, the structure of the stem can be made use of in distinguishing between the various types of stems, namely, the monocot type, the dicot type and the fern type. If a distinction of the first two has been made on other grounds, it should be "clinched" by comparing the vascular bundles and their arrangement in these two types, as well as in the fern type. Nor should the comparison end here, but in the case of the dicots should be carried to those exhibiting primary and secondary structures. Then will the student fully comprehend the meaning of such terms as bark and phloem, of herbaceous and woody, of heartwood and sapwood, of periderm and borke, of cortex and cork, of cambium and phellogen, of pericycle, medullary rays, tracheids, sieve cells, collenchyma, and numerous other terms encountered in the official description of the structure of drugs derived from the stem of the plant.

The various types of vascular bundles should be studied in detail not only to ascertain the elements present and their arrangement, but also to observe what changes take place in the bundles of stems which undergo secondary growth. This change is excellently demonstrated by comparing young and old stems of *Menispermum canadense*. By this time the term "bark," defined as all tissue regions exterior to the cambium, should mean something to the student, and he should also by this time comprehend the nature of the three parts, namely, the inner, middle and outer parts, and realize why a certain bark drug is stipulated to consist of the inner bark in one case and to be "rossed," or have the "borke" removed, in another case.

For a more detailed study of a bark, *Cascara Sagrada* lends itself very nicely in transverse section. The three parts show up very clearly, the inner bark with its phloem elements and medullary rays, the middle bark with its cortical parenchyma and patches of stone cells, and the outer bark consisting chiefly of phellogen and cork cells.

If the above amount of detail is devoted to these plant parts in the botany course, the student should be fairly well equipped to take up a study of the drugs consisting of those plant parts.

TWENTY-FIFTH ANNIVERSARY CELEBRATION, HONORING DEAN C. B. JORDAN,* MARCH 13, 1935

REMARKS OF ROBERT P. FISCHER, PRESIDENT OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

To review the progress of American Pharmacy in the past quarter century in three minutes, as requested by the Committee on Arrangements, appears to be a rather formidable task. If we bear in mind, however, that the recorded history of pharmacy covers 40 centuries, it is quite obvious that the historian of the future will probably discuss this period—which looms so large in the minds of the present generation—in comparatively few words. At the rate of 3 minutes

* Purdue University School of Pharmacy

per quarter century it would take just 8 hours of continuous talking to review the accomplishments of our profession from its beginnings in the mists of antiquity to its present status in the fogs of the New Deal

In twenty five years we have lived through the entire or partial administrations of six Presidents of the United States We have lived through one of the greatest wars of history We have baptized and buried prohibition We have gambled our way into and out of prosperity, and through it all Pharmacy seems to have made some real progress

A quick bird's eye view of the situation indicates

- 1 A sharp trend toward better regulation of the commerce in drugs and medicines
- 2 An industrial development which, in line with other national trends, has favored the expansion of corporate interests at the expense of the small operator, and
- 3 A distinct elevation of our professional standards

In 1910 only three states required pharmacists to possess a college education The restrictions of the sales of narcotic drugs were inadequate Restricting the sale of hypnotic drugs had hardly been thought of Federal Food and Drug regulations were in their infancy The Harrison Anti narcotic Act was just in the making To day, after the lapse of 25 years we find two thirds of our states requiring pharmacists to be college graduates and pharmacists urging still more stringent regulations for the control of adulteration, misbranding and advertising of drugs and with a fair prospect of obtaining them

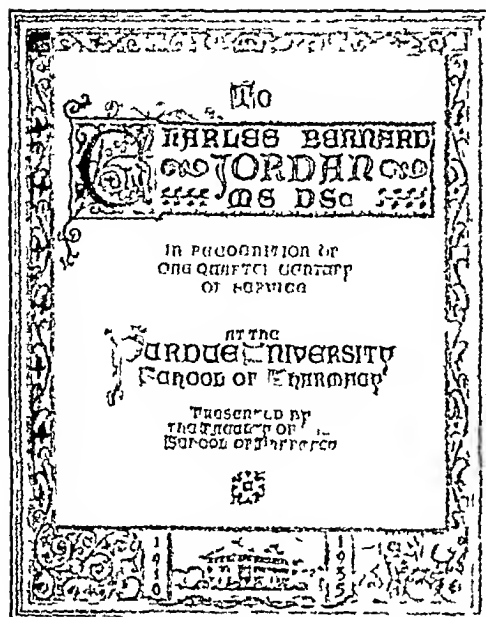

We have accomplished strict regulation of the dispensing of narcotics and there is an increasing demand for the regulation of sales of hypnotics as well as a more general public appreciation of the need for confining sales of all drugs, medicines and poisons to qualified pharmacists The experimental work of pioneer states in this field has in many cases led to standardized national and state procedures The closer cooperation of state and national pharmaceutical organizations is responsible for much of this progress Monthly publications full time secretaries, legal advisers and specialized activities in our state and national associations are all developments of the past quarter century

The World War gave a great impetus to the medicinal chemical industry in the United States We are no longer dependent upon Europe for synthetic organic chemicals The development of the machine aided and abetted by the difficulties in obtaining supplies of alcohol for manufacturing purposes on a small scale both during and since prohibition has removed much pharmaceutical manufacturing from the retail drug store We can only marvel at the development of the manufacturing, control and research facilities of drug manufacturing corporations during the past twenty-five years, even as we regret to see the original servant of the pharmacist apparently becoming his master

The chain store movement in the retail drug field is largely a development of the past quarter century While it has undoubtedly had a stimulating effect upon the merchandising activities of retail druggists its effect on the professional side has been unfortunate for it has not only detracted the attention of retail pharmacists from their primary function but has introduced into their establishments a variety of merchandise in which they ordinarily have no interest and which has made them a target for complaint from merchants in other fields and has had a tendency to obscure their professional status in their own communities

To combat the unfavorable developments resulting from mass production and mass distribution leaders in pharmacy have resorted to the most formidable weapon at their command—education To paraphrase a biblical expression, "where there is vision the people will live" and vision is the result of education The most encouraging development in American Pharmacy during the past quarter century is the rapid increase in standards of education and licensure From no general high school requirement for college entrance in 1910 to not less than 4 years in 1923 and from a short 2 year college course in 1910 to a minimum 4 year course on an academic basis in 1932 is the record of progress stated briefly That this minimum educational requirement is in force now in more than two-thirds of the States of our Union and that the courses given by the American Colleges of Pharmacy have reached the high standard now obtaining is due in large measure to the foresight and determination of a relatively small group of leaders in American Pharmacy

Right here in Indiana and on this very campus there has labored long and faithfully an individual to whom the last 25 years must have passed very rapidly and who can look back on them with considerable satisfaction

Memorial Plaque honoring Dean C B Jordan, presented by the faculty of the School of Pharmacy, Purdue University

While turning out a new generation of pharmacists in his own college and leaving upon them the imprint of his personality and passing on to them the idealism of a noble calling, he has also for many years exercised a judicious and wholesome influence upon the destinies of pharmaceutical education throughout the United States. I need not tell you that I refer to Dean Jordan.

His services as president and later as chairman of the Executive Committee of the American Association of Colleges of Pharmacy have been of a high order. He has served the AMERICAN PHARMACEUTICAL ASSOCIATION as secretary and chairman of its Section on Education and Legislation and as vice-chairman and chairman of its House of Delegates.

It is my great privilege to bring the greetings and congratulations of the AMERICAN PHARMACEUTICAL ASSOCIATION to Dean Jordan and to Purdue University on this very enjoyable occasion and to wish for both the Dean and the University many additional years of the happy and fruitful association which has brought great credit to them as well as to American Pharmacy.

CALIFORNIA ASSOCIATION

The 1935 convention of the California Pharmaceutical Association at Hotel Coronado, San Diego, June 23rd-26th, with the added drawing power of the International Pacific Exposition is expected to establish an attendance record for state pharmaceutical conventions.

A Scientific Pharmacy section, a distinct innovation this year, will round out a well balanced program of business and pleasure.

Annual Meeting of Boards and Colleges of Pharmacy, N A B P District No 2 at the AMERICAN INSTITUTE OF PHARMACY, Washington, D C March 11 and 12, 1935

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council

—Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association "

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues-paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates "

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

BALTIMORE

The regular monthly meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held March 15, 1935, at the Emerson Hotel, President Wm F Reindollar in the chair The minutes of the February meeting were read and approved The meeting was then taken over by the Debating Society of the School of Pharmacy, University of Maryland The occasion was a debate between the School of Pharmacy of the Medical College of Virginia and the School of Pharmacy of the University of Maryland The subject of the debate was

Resolved, That the sale and distribution at retail, of drugs medicinal preparations and sick-room supplies be limited by law to the retail pharmacy

For the Affirmative School of Pharmacy of the Medical College of Virginia Speakers Toney Mehford Richmond, Va , John Raymond Hurt, Drakes Branch Va , Woodrow Byrum, Suffolk Va , Felix Clyde Jennings, Norfolk, Va (Alternate)

For the Negative School of Pharmacy of the University of Maryland Speakers Sylvan Silverman, Milton J Wilder, Harry Peretz, Alex Ogurick (Alternate)

The judges for the debate were Dr Julien Gunn of the Johns Hopkins University, Hugo P Wise of City College, and Paul Clarkson of the Legal Department of the Consolidated Gas and Electric Co , Baltimore

Each speaker had eight minutes for the presentation of his topic with a five-minute rebuttal At the conclusion of the speeches the judges cast a unanimous vote in favor of the team representing the School of Pharmacy University of Maryland, who upheld the negative side of the debate

President Reindollar extended a hearty vote of thanks to the members of both debating teams for their efforts and congratulated the winning team

Approximately one hundred were present with many students from the School of Pharmacy
C JELLEFF CARR, *Secretary Treasurer*

CHICAGO

The monthly meeting of the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held March 19th, at the University of Illinois College of Pharmacy

The speaker of the evening was Dr John C Krantz Jr , Chief of the Bureau of Chemistry Department of Health of the State of Maryland and Professor of Pharmacology at the Medical School of the University of that State His subject was "Pharmacy in the Quest for Health "

Dr Krantz began his discussion of "Pharmacy in the Quest for Health," by stating that disease is the arch enemy of mankind. It has haunted his every activity from the superstitious dweller in the cliffs to the occupant of the modern sky scraper as you know him to day.

"It can be actually said that the progress of man on this planet is the result of his efforts to beat back the ever present menace of disease. Trace down through the centuries the discoveries that have helped to prolong life—to day drugs that were looked upon as almost necessary in years past have given way to bacterial serums and other medicaments administered by hypodermic injection.

"Now, let us try to point out what effect these trends might have on pharmacy as we know it and as it is to be practised in the future. In most all serious illnesses we find that before long the patient is hospitalized, where he can be treated more adequately. Deliveries are performed 75% in hospitals to day. Syphilis and malignant diseases find their way in and out of hospitals. Most of the medication carried on in the home years ago is now carried on in hospitals. There in modern hospitals, pharmacists who devote all their time to prescriptions are able to compound a larger number than those who are working in a larger diversified field. A few pharmacists in well equipped hospitals can do the work of many pharmacists in stores where their efforts are divided. Many pharmacists have found out that they have to make a living following more commercial pursuits rather than the profession for which they have qualified themselves.

"The trend to day is toward simpler prescriptions which is due to the teaching of modern pharmacology in the medical schools to prescribe simple drugs. The more complicated the prescription, the more chance of failure. Choose drugs the therapeutic value of which has been tested. We formerly believed that it was necessary to have an infusion of digitalis now all this can be accomplished by using the powdered drug.

'I say that the stress that the Schools of Pharmacy place on incompatibilities is wasted effort. Pharmacy should say we are through with this medical mess we are interested in the welfare of the patient and the patient's welfare is not served by complicated medicines. Don't we have some obligation to the patient? If those people practicing medicine to day do not discontinue to write incompatibilities we should take some step to stop them, and I believe it would stand as a lasting monument to Pharmacy.

'In say 1915, the manufacturing houses began to make serious inroads into the preparation of medical products and the pharmacist has gradually drifted away from this preparation.

"We take a pharmacy so called in which the pharmacy part of the store has reached the point of vanishing significance and we send a prescription to it that calls for sodium bromide, potassium bromide and strontium bromide. A copy is asked for and when wrapped with the prescription automatically becomes a part of the prescription. If the strontium bromide is left out of the prescription or substituted with one of the other bromides the pharmacist may be prosecuted under the Pure Food and Drugs Act. The man does not realize that he is a definite part of the public health program and is not taking his work seriously.

We sent out into the state prescriptions for one half ounce of a saturated solution of potassium iodide. As a result we found prescriptions varying from 103% to a minimum of 55%. This means that if you were to take such a prescription to be filled your chances are even of getting an 88% solution. It should be 100%.

'Not many months ago a doctor came into the laboratory for a 1-5000 solution of silver nitrate. He said that there was only one store in the city to which he would trust the filling of the prescription. Let us say that this was uncalled for, but nevertheless it represents the attitude of the doctors toward pharmacists who are surrounded with commercial pursuits to a point where his doctor has lost faith in him.

"You might say we pharmacists only need to have the doctor on our side. A chemist wanted methylene blue for intravenous injection for a member of his family and wanted it prepared exactly right. The doctor said there is a certain druggist who can make this solution for you. The fellow threw up his hands, saying 'I don't intend to inject it into my mother if any retail druggist has had his hands on it.' He does not picture a druggist as one interested in methylene blue. He has so diversified his efforts and energies that he cannot be interested in intravenous injection of methylene blue.

"Pharmacists have broken faith with their public health responsibility. Now I am

interested in the public health and I am very interested in the pharmacist retaining his responsibility in the community as a public health service. Let me tell you why I think this is true and my statement is justified. Recently a preparation, a patented herb concoction, came into our community. Blazed in the headlines of the newspapers, this new preparation—for reducing—will take bile out of the liver, will relieve stomach troubles, is excellent for diseases of the bladder and has proved its worth like no other drug in kidney troubles. I take it they mean Bright's disease and arthritis. Anyone can see it is advertised for sale in all leading drug stores. Those pharmacists do not say I know this is wrong. No, they do not say this, they stock it because the profit is long, the advertising will bring sales and they become a part and parcel of that vicious system which robs a man when he is down, and I am sure that even in his most vicious moments Jesse James would not do that.

I don't think you need a Moses. You are struggling with certain laws and with your profession the need for which in large numbers is rapidly diminishing, and I don't think it is going to get any better. Here are my solutions. Pharmacists must be motivated by service and not by profit. We must, if we are to survive as a profession, include the science of the action of drugs in health and disease. One of our great difficulties in pharmacy has been that we have not stressed professional service to the point where we can charge for it. How much profit are we going to make on the compounding of a prescription? We should think of the drugs as insignificant and the charge should be for service. Until we get the public to realize we have a right to charge for service we cannot be looked upon as a profession, for one of the marks of a profession is that it has a legitimate right to charge for service.

'Our schools must realize, if they do not want to run the profession, this is no time to produce an ever increasing number of pharmacists to practice in this none too fertile field when there is a diminishing need for them. I congratulate you that you have required one year of college work prior to entrance to your Pharmacy College.

'Do our colleges realize that they have within their power the potential means to alleviate human suffering? Do they have time for service or are they pounded all day long by teaching until there is not an ounce of energy left? You can see it everywhere. Research is the promised land which lies before you, my bidding is to enter into it."

LAWRENCE TEMPLETON, *Secretary*

NEW YORK

The March 1935 meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on Monday evening, March 11th, in the College of Pharmacy, Columbia University. About forty-five members and their guests attended.

President C. W. Ballard presided, the report of the secretary was read and approved.

Chairman Robert S. Lehman of the Committee on Education and Legislation, reported the following:

Pure Food and Drug Legislation—Hearing on S. 5, Senator Copeland on March 2nd. A large number of persons appeared before the Sub Committee of the Senate Commerce Committee speaking pro and con. It is surmised that the bill will again have to be re-written. It is said that Senator Copeland will accept changes advocated by Mr. Charles Wesley Dunn.

Toilet Soaps are now under the Retail Drug Code.

H. R. 6246, Representative White, prohibits manufacturer's special rebates or discounts to chain or branch store organization.

H. R. 5062, Maps. This bill will prevent unfair discrimination in price between different purchasers of commodities and give the same prices to the small as the large buyer.

S. 1923, King. This bill states that it will not be unlawful for trade-code members or others to cooperate to defend themselves against unfair or deceptive practices or acts. This should enable price standardization by agreement.

S. 944, Wheeler, Federal Trade Commission Bill. Reported upon favorably by the Committee. Forbids price discrimination, and directs the Federal Trade Commission to enforce the law.

Chain Store Laws—The West Virginia Chain Store Tax Law has been declared valid by the Supreme Court of the United States. There are now 37 chain store tax laws before the legislatures of 28 states. It is believed that most of these laws will be enacted in some form or other.

According to amendment to the Alcohol Regulations pharmacists may purchase industrial alcohol in containers of one gallon, until April 15, 1935, after that date purchases must be in containers in excess of one gallon

State Legislation—Bills, Assembly No 432, 772, Introductory No 422 Senate No 415, Introductory No 398, the Fair Trade Bill (Junior Capper-Kelly Bill) This bill has a good chance of passing this session write or telegraph your senator and assemblyman in favor of the measure

This law has been in effect in California for over a year and has been of immense benefit to the retail trades All manufacturers of trade marked drug merchandise are coöperating with the retail distributor in that state

Bills, Assembly No 499, Introductory No 489 Senate No 418, Introductory No 401 This is the Prophylactic Bill, hearing on the same on March 5th Prospects of passing are good but you should also write or wire the senators and assemblymen in favor This law would limit the sale of all gynecological medicines, remedies and appliances to stores registered by the New York State Board of Pharmacy

A bill providing for a chain store tax is before the Legislature possibility of some legislation this session

A bill for the enforcement of the Code of Ethics of the State Pharmaceutical Association has a good chance of being enacted This bill provides that the Board of Pharmacy may revoke a license for unethical or unprofessional conduct the latter to be determined in part by the Code of Ethics of the N Y State Pharmaceutical Association

Chairman Steiger, of the Committee on Progress of Pharmacy, was then called upon for his report which follows

Both the scientific sections and the advertising columns of the journals indicate an increasing interest in vitamins Glandular products and new hypnotics are also conspicuous in the literature

Joseph Roe in *Science* (Vol 80, page 561) describes a color test for Vitamin C When ascorbic acid is boiled with HCl CO is given off and furfural is formed This can be detected by the use of aniline, phloroglucinol tests

According to the *Oil, Paint & Drug Reporter* (March 4 page 49) Charles L. Huisking, upon returning from a trip through Europe reports that Norway and other countries by extensive scientific study hope to demonstrate the superiority of pure natural Cod Liver Oil over the so-called high vitamin oils and similar products (*Oil, Paint & Drug Reporter*, February 25, page 46)

Experiments conducted by the Division of Radiation and Organisms of the Smithsonian Institute, indicate that certain wave lengths of light are specifically 'poisonous' to bacteria algae and various parasites These rays are found in the invisible ultraviolet between wave lengths of 3900 and 1850 "Ångstrom units" There is extreme specificity within this range a difference of a few Ångstroms apparently marks the difference between innocuousness and virulence for some of the lower organisms upon which the experiments have been tried

Guteros and Schmclkes, in the *J of Biological Chemistry* (Vol 107, pages 235-239) report on the compound action of sodium hypochlorite, chloramine T and azochloramide on organic substrates The authors compare the rate of disappearance of available chlorine with various organic substrates and germicidal activity Their conclusion is that the chloramine T is a better germicide than sodium hypochlorite and that azochloramide is more useful than either, in the presence of organic matter

An appeal to pharmacists to throw off the spirit of apathy appeared in the *Chemist and Druggist*, London, February 2 1935 It formed the theme of the presidential address to the Liverpool Chemists Association on January 24th Conditions in England are evidently similar to those here

President Clubb, said in part "If there is one question which has been discussed 'ad nauseam' in the pharmaceutical press it is the perennial one, What is wrong with pharmacy? Every writer on the subject has fulminated against the encroachment of outside traders on our livelihood The menace of the multiple stores (chain stores) the competition of charitable and municipal clinics, etc are old stories" He concludes that these examples are the symptoms of a disease—"Apathy"

A communication was read announcing the date, place and tentative program for the annual convention of the AMERICAN PHARMACEUTICAL ASSOCIATION. Attention was called to the fact that a communication was received from Mrs. Jacob Diner in which she stated that Dr. Diner would be unable to attend future branch meetings and that we might remove his name from the mailing list. Action was taken upon this as follows: Dr. H. V. Army moved that Dr. Jacob Diner be made an honorary member of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION. This motion was seconded by Mr. Lehman, voted upon and passed. The secretary was directed to write to Mrs. Diner and inform her of this action by the Branch.

Dr. Ballard then called attention to a letter which he had received from the Executive Committee of the New York Pharmaceutical Conference asking that two representatives be sent from the New York Branch to act for the Branch at an organization meeting of the New York Pharmaceutical Council, which will replace the New York Pharmaceutical Conference. In connection with this Dr. Schaefer presented the following resolution and moved for adoption. This was seconded by Dr. H. V. Army, was voted upon and passed:

'WHEREAS, The N. Y. State Pharmaceutical Association is inviting local pharmaceutical organizations to become affiliated with it, and

"WHEREAS, The present N. Y. Pharmaceutical Conference is about to be disbanded and the N. Y. Pharmaceutical Council is now being organized under the auspices of the State Association, and

' WHEREAS, All local organizations which approve of affiliation with the State Association are eligible to send delegates to the organization meeting of the new Council, be it

"Resolved, That the N. Y. Branch of the A. P. H. A. approve of the idea of affiliation with the State Association and with the new Council provided, however, that the rules of affiliation and the Constitution and by-laws of the Council as eventually drawn up will contain and include nothing contrary to the principles of our parent organization nor obligate us to any financial outlay and further be it

' Resolved, That the president of our Branch be directed to appoint two representatives and two alternates from our membership to act for the Branch on the present Council Organization Committee '

Dr. Ballard commented on this reorganization move, saying that he favored the move since he believes that it was in the right direction in coordinating legislative activities among pharmaceutical organizations and that it ran parallel with the thoughts expressed by President Fischel at the testimonial dinner recently held in his honor.

Fred Schaefer and Robert S. Lehman were appointed to act for the New York Branch with Hugo H. Schaefer and William C. Anderson as alternates.

This completed the business part of the meeting. Dr. Ballard then called upon the speaker for the evening, Dr. Erich Meyer of the Industrial Research Division of L. Sonneborn Sons, Inc. The complete text of Dr. Meyer's address follows:

WHITE MINERAL OIL AND PETROLATUM IN PHARMACEUTICAL AND COSMETIC PRACTICE

BY ERICH MEYER *

It is surprising that very little information is found in to-day's chemistry textbooks or even in handbooks on chemistry, medicine and pharmacy regarding the chemical and physical characteristics of white mineral oils and petrolatum. Rarely does one find more than just a few lines, simply indicating that such products do exist, and often such short references are rather confusing and misleading since, unfortunately, these products are known under many different and frequently misleading names. This lack of information in reference literature is the more surprising since white mineral oils and petrolatum are very important ingredients of to-day's pharmaceutical and cosmetic preparations.

Both white oil and petrolatum are crude oil derivatives. Crude oil itself is a complex mixture of a large number of different hydrocarbons. Only recently has the petroleum chemist been

* Dept. of Industrial Research, L. Sonneborn Sons, Inc., New York.

able to separate and identify a few of them. The generally accepted theory of the origin of crude oil is that which assumes the putrefaction of animal and vegetable matter under water eons ago. With the shrinkage of the earth's crust and its attendant pressure, the crude oil has been filtered through various strata as it was forced from one place to another by these phenomena.

Occurrence of Crude Oil—To day we find crude oil trapped in sandstone, limestone and other so called oil-bearing formations beneath the earth's surface on almost every continent. In Asia the best fields are found in Burma, in the Dutch East Indies, in Persia and in Mesopotamia. In Europe, crude oil is found mainly in Russia, Roumania and Poland. But the largest producer of crude oil is the North American continent. There are tremendous fields in Mexico and even larger ones in California, Texas and Oklahoma. The only field in the eastern part of the United States is the so called Pennsylvania field.

Crude Oil of Various Types—Crude oil can be classified as to its chemical structure into three different types, namely, naphthene base crude, paraffin base crude and mixed base crude. Naphthene base crudes are found on the Gulf Coast, in California, and in many parts of Russia. They are composed mainly of naphthene hydrocarbons of cyclo paraffin and cyclo olefin character. Paraffin base crudes are principally found in the Pennsylvania field. The name "paraffin base" refers to the atomic arrangement and should not be confused with paraffin wax. A paraffin base crude is mainly composed of straight chain hydrocarbons of the paraffin series. Mixed base crudes are found in the Mid Continent field, such as parts of Texas and Oklahoma. As the name indicates, these oils contain both types of hydrocarbons.

Origin of White Oil Refining in Russia—White Mineral Oils are refined from all three types of crude oils. According to reliable information, the present process of making white mineral oil was invented by J. Markovnikov, a Russian chemist, about 1887. In 1895 another Russian, Grigori Petroff, perfected the process to a point where it was commercially useful. Petroff undoubtedly used Russian crude because at that time the only known crude oil in Europe available for the purpose was Russian crude. A small refinery was established in Riga, then in Russian territory, and thus white mineral oils became first known as "Russian Oils". Ever since all white oils intended for internal consumption have been commonly termed "Russian Oils" without regard to the origin of the crude or the geographical location of the refinery. Thus the term "Russian Oil" is rather the description of the refining process and not the name of a definite type of oil.

Principle of White Oil Refining—In the refining of white mineral oils, at first the light fractions such as gasoline, naphtha, kerosene and fuel oil are distilled off. The remaining residue is further fractionated and one of these fractions represents the raw material for white mineral oil. The main object in the refining process of white mineral oils is the removal of the unsaturated hydrocarbons. These unsaturated compounds are chemically unstable and, among other undesirable features, give the unrefined oil its typical odor and taste. The refining consists principally of treating the oil with sulphuric acid, subsequent washing with alkalis followed by various filtration processes. The result is an oil which is perfectly colorless, tasteless and odorless and free from unsaturated hydrocarbons. The mere fact that an oil is colorless or waterwhite, of course does not in itself signify that it is a completely refined mineral oil in the medical sense of the word, as it is possible to obtain a waterwhite appearance by simple filtration.

Removal of Unsaturates—an Essential—From a theoretical standpoint it is obvious that all unsaturated compounds and other impurities must be completely removed to render the oil fit for internal use. Similarly, oil for cosmetic purposes must be free from unsaturates in order to guard against skin irritations traceable to the oil. Furthermore, it is highly desirable that a white mineral oil for cosmetic use not only should be colorless and odorless but should remain so. It stands to reason that only a mineral oil which has been completely refined, and is thus free from unsaturates, possesses sufficient stability.

The U S P Acid Test—In order to determine to what extent the unsaturated hydrocarbons have been removed from a mineral oil, the so-called acid test is generally employed. This test established by the U. S. Pharmacopœia is designed to show the true degree of refinement of an oil. Five cc. of the oil are heated with 5 cc. of 93% to 95% sulphuric acid in a water-bath for ten minutes and the mixture shaken at intervals of 30 seconds. Applied to partially refined oils, the acid will turn a dark yellow, brown or even black, but with a true white mineral oil the color will change only slightly.

The present U S Pharmacopœia specifies that a U S P white mineral oil, when subjected to this test, should not become darker than pale amber. This rather vague specification was a source of many disputes in the past because no two people could agree as to what is pale amber and what is darker than pale amber. Therefore, most refiners of U S P white mineral oils have developed a color scale of their own in order to enable them to express numerically the color of the acid layer.

However, upon the suggestion of H V Arny, the U S Pharmacopœia in its 11th edition (now in preparation) has finally adopted a definite color standard for the acid test by which white mineral oils refined to U S P purity can be easily distinguished from those of lesser degree of refinement. This color standard, which is a combination of solutions of cobalt chloride, ferric chloride and copper sulphate of definite concentrations, seems to fulfil all the requirements to be expected from a U S P standard. The various reagents are readily obtainable and are permanent.

White Mineral for Intestinal Lubrication—One of the first physicians to recommend white mineral oil for intestinal lubrication was Sir Arbuthnot Lane. However, it was not before 1894 that first mention of white mineral oils appeared in the U S Pharmacopœia. To day, the U S Pharmacopœia distinguishes between two grades of White Mineral Oil or Liquid Petrolatum, as it is officially designated in the Pharmacopœia. One which has a kinematic viscosity below 0.370 at 100° F is called "light" and the other which has a kinematic viscosity above 0.381 is called "heavy." Usually, the viscosity of a white mineral oil is determined with a Saybolt Universal Viscosimeter at 100° F, and expressed in Saybolt seconds. Thus a kinematic viscosity of 0.381 at 100° F is equal to a Saybolt viscosity at 100° F of 175. White Mineral Oils are refined to-day having viscosities as high as 345 Saybolt seconds at 100° F.

(a) *Significance of Viscosity* If white oil is used straight as such for intestinal lubricating purposes, it is advisable to specify an oil of a viscosity as high as possible because it is generally believed that the higher the viscosity the lower the tendency toward leakage.

(b) *Significance of Cloud Point* A further important requirement of a white mineral oil for intestinal lubrication is a low cloud point which serves as an indication of the absence of solid paraffins which would tend to cloud and solidify the oil at low temperatures. The oil should not become more than opalescent when cooled to 0° C.

However, a cloud point caused by the presence of solid paraffins should not be confused with a cloud point caused by traces of moisture in the oil, since a trace of moisture which might be absorbed by the oil will also cause cloudiness when cooled to 0° C. Even with the greatest care it is very difficult to altogether exclude absorption of moisture, particularly in humid atmosphere, since a white mineral oil of high purity is quite hygroscopic. The absorption of minute quantities of moisture often occurs while filling the liquid into containers, though this operation may be performed with the utmost speed. Absorption of moisture also may occur when bottles of white mineral oil are left open for any length of time. A poor cloud test, due to the presence of a slight amount of moisture, is of course, not a serious matter and therefore should be well distinguished from clouding caused by the presence of solid paraffins. For this reason, the British Pharmacopœia specifies that the oil shall be *dried* prior to determination of the cloud point. The proper procedure to dry white mineral oil is to heat the oil to 110° C and then allow it to cool in a closed desiccator. The use of a desiccator is very important because the hot oil has a strong tendency to absorb moisture, and if left to cool in a humid atmosphere, it may absorb so much moisture that it would become cloudy even at ordinary temperature.

(c) *Significance of Specific Gravity* Specific gravity also has a definite significance in judging the suitability of an oil for intestinal lubrication. Recent investigations indicate that the action of white oil in the intestinal tract is not only one of simple lubrication but it seems that white oil at the same time emulsifies with the intestinal contents, thus exerting a softening influence. Therefore, a white mineral oil of high specific gravity—a specific gravity which is as close as possible to that of water, namely, 1—will more readily emulsify than one of low specific gravity. Furthermore, information as to the specific gravity of a white mineral oil is often found helpful in determining the source from which the oil comes or the type of base of which it is composed.

(d) *Significance of PbO Test* The lead oxide test as described in the U S Pharmacopœia, is designated to show up sulphur or injurious sulphur compounds. It is safe to say that all white mineral oils offered for medicinal purposes show absolutely negative lead oxide tests.

Source of Crudes for White Mineral Oils—Heavy white mineral oils are mostly obtained from

Gulf Coast and California crudes and also from Russian, Roumanian, Venezuelan and Peruvian crudes. They are composed of saturated naphthene hydrocarbons which are cyclo paraffins of the hexamethylene type with single bonds only. So-called Russian Oil is refined mainly from Russian, Roumanian, Venezuelan and Peruvian distillates. The refining, however, is not done in Russia. Instead, the oil stock is sent to Germany and other countries for refining. Thus the term "Russian oil" is apparently a misnomer. In chemical composition white oils made from Russian and American crude are practically identical. There is no chemical test for determining the source of the oil. From the standpoint of purity, imported oils are usually equal to American oils. Usually so called Russian White mineral oils have a lower specific gravity than American white mineral oils of the same viscosity, which is a fairly accurate method of identification.

White Oil Emulsions—Aside from their use for intestinal lubrication, straight U S P heavy white mineral oils are also employed in emulsified form. Usually, such emulsions contain about 50% to 70% of white mineral oil emulsified with water by means of acacia, agar agar, tragacanth or similar gums. Since the use of these emulsifying agents tends to make the finished product rather heavy, a lower viscosity oil is sometimes selected. Absolute freedom from any and all impurities—even those which are not detectable by means of the acid test—is particularly essential for white oil emulsions since even traces of such foreign substances tend to partially invert the phase of the emulsion.

Nasal Sprays—Another pharmaceutical application of white mineral oils is in the manufacture of nasal sprays and nose drops. Most of these preparations are made up with a white mineral oil of about 60 to 90 viscosity as a carrier, because it has been found that an oil of this viscosity is distributed readily through the nasal mucosa, bringing the active principles to all affected parts. Furthermore, oils of this viscosity range are tolerated even by infants. The oil should have a cloud point sufficiently low so that the finished product will not cloud at ordinary temperature. The active principles usually employed in nasal sprays include eamphor, menthol, eucalyptol and thymol, as well as ephedrine salts or anhydrous chlorobutanol. These latter compounds have the property of contracting the mucous membranes, thus making breathing easier.

Baby Oils—White mineral oils used in the preparation of so-called 'baby oils' range in viscosity from 75 to 100 Saybolt seconds at 100° F. White mineral oils are preferred to vegetable oils since the latter, particularly upon exposure in a thin film, form fatty acids which tend to develop a varnish-like film and thus often have a tendency to clog the pores with consequent irritation to sensitive skins. Particular care should be exercised in selecting a white mineral oil which is as completely refined as the U S P standard prescribes. Incompletely refined oils contain a varying amount of unsaturated hydrocarbons as impurities. These unsaturated hydrocarbons seem to have a definite irritating effect on the skin.

Ointments and Creams—It is for this reason that white mineral oils of the U S P purity were introduced for the manufacture of ointments, salves and creams of all kinds as, for instance, cold creams, cleansing creams and many other types. White mineral oils of U S P purity are extensively used to day for these purposes and their absolute purity, as indicated by their U S P acid test and their complete lack of odor and color have made them one of the most dependable raw materials of the cosmetic industry.

Some Essential Requirements for Cosmetic White Oils—In determining the proper viscosity of a white mineral oil for cosmetic creams, it was found that a viscosity of about 65 to 75 Saybolt seconds at 100° F is most satisfactory. An oil of higher viscosity lacks quick penetration and tends to make the finished cream excessively greasy. On the other hand, an oil of a lower viscosity may result in a product of thin body. One of the most important requirements of white oil in such preparations is to accomplish the liquefying of the cream not only as quickly as possible but it is equally as important that, with the help of the oil, the cream spreads evenly over the skin in a thin film.

A further interesting fact is that white mineral oils of paraffin base type are usually preferable to white mineral oils of naphthene base type in the manufacture of pharmaceutical and cosmetic creams. One of the typical differences between a paraffin base oil and a naphthene base oil is their pour points. While most of the naphthene base oils solidify at temperatures of about 15° F to 0° F or below 0, paraffin base oils have a much higher pour point, namely about 25° to 50° F. The high pour point of paraffin base oils is caused by the presence of solid hydrocarbons in the oil. It appears that these solid hydrocarbons have a better affinity for those materials

which the cosmetic manufacturer adds to the oil in the course of his manufacturing process. Thus it has been found, for instance, that paraffin wax and similar materials used in cosmetic preparations blend better with a paraffin base oil than with a naphthene base oil. Therefore, as a rule, paraffin base oils give a smoother cream and the tendency toward separation of the liquid from the solid ingredients is reduced to a minimum.

As mentioned before, paraffin base oils usually can be identified by their higher pour point and by the fact that at the same viscosity paraffin base oils have lower specific gravity than naphthene base oils.

Liquid Brilliantine—White mineral oils are used as a base for liquid brilliantines. A low viscosity oil—about 50 to 75—is generally employed for this purpose and perfume and coloring material are added. For some time past it had been conceived that an ideal oil base for brilliantines should consist of white mineral oil of non-volatile characteristics, combined with a mineral oil of volatile characteristics. When using such a combination on the hair, the volatile portion of the mixture would evaporate in a short time, leaving an exceedingly thin and continuous film on the surface, thus eliminating stickiness and greasiness. The volatile characteristics of a hydrocarbon distillate of the type of kerosene would be satisfactory as a volatile ingredient of such oil combination. However, the use of ordinary kerosene was strictly limited because of its strong characteristic odor which cannot be easily concealed. Furthermore, the unsaturated hydrocarbons contained in unrefined kerosene are likely to cause a burning sensation and in many cases more or less acute dermatitis.

With the development of a completely refined kerosene, it is now possible to prepare an oil base along the lines just mentioned. These fully refined hydrocarbon distillates possess all the useful properties of ordinary kerosene, but, apparently, none of its drawbacks. Measuring these oils, which in fact are the lowest viscosity white mineral oils, by U. S. P. standards, the acid test conforms to the U. S. P. specifications although of course they cannot be classified as U. S. P. white mineral oils. The absence of kerosene odor in these completely refined, light hydrocarbon distillates extends their range of usefulness in connection with the manufacture of a large variety of cosmetic products.

Suntan Oils—Another application of white mineral oils is as a carrier in the preparation of so called suntan oils. These preparations are used for protecting the skin against the excessive action of the sun's rays. Such preparations contain an active ingredient which absorbs the actinic rays and so prevents too severe action on the skin. Sometimes, a small percentage of almond oil, castor oil or similar vegetable oil is added to the white oil in order to increase its adhesion.

Non-Drying Characteristics—A small percentage of white mineral oil (up to 4%) has been found helpful in the manufacture of vanishing creams because it tends to prevent the stearic acid from drying out. Incidentally, this same principle is often applied in the manufacture of tooth paste. A small percentage of white oil seems to satisfactorily overcome hardening of the tooth paste in the tubes, particularly those shipped to hot countries.

Allied Cosmetic Uses—White oils are used as softening agents in the manufacture of brushless shaving creams, soaps, nail polish removers and in various other softening preparations. They are used in numerous hair tonics and skin tonic lotions. In all these cosmetic applications and in many others not mentioned here, the inactivity of fully refined white mineral oils to chemical reaction, their freedom from odor and color and their relative stability toward light, heat and aging are among the most important reasons for their usefulness in this industry.

PETROLATUM—ITS COMPOSITION

Petrolatum is closely related to white mineral oil. However, in contrast to white mineral oil, which consists mainly of hydrocarbons liquid at ordinary temperature, petrolatum is composed of solid and liquid hydrocarbons solid at ordinary temperature. There is also a close relationship between petrolatum and paraffin wax, but in contrast to paraffin wax which forms crystalline aggregates petrolatum is amorphous. We can imagine that petrolatum is a colloidal system in which the solid wax is the external phase, and the oil the internal phase. In other words, the wax absorbs the oil just as gelatin does water, causing the formation of a swollen jelly-like mass. This explains the fact that petrolatum in its concentrated form will not leave an oily spot on paper, showing that the wax is the external phase. For a system to form in this manner, and not have

the liquid separate from the solid hydrocarbons in time, a third component is necessary. This substance acts as a gel former and is called proto substance.

This proto substance can be separated from the petrolatum by extraction with acetone. The proto substance is insoluble in acetone and is then separated from the residue by dissolving it in pure Benzol.

Importance of Proto Substance—Proto substance is present in satisfactory quantities in natural petrolatum. However, it is very often removed in the refining process and is not present in synthetic petrolatums. An insufficient amount or a complete lack of proto substance upsets the balance of the solid and liquid components of the petrolatum and, as a result, such petrolatum has a tendency to separate and cause the objectionable "swacating." Therefore, the presence of an ample amount of proto substance in a petrolatum is absolutely essential. In addition, proto substance appears to contribute to the emollient or soothing properties of petrolatum. In order to preserve the proto substance, no drastic methods, such as intense heating or strong chemicals, should be employed in the refining of the petrolatum.

Refining Methods—Petrolatum is obtained only from paraffin base (Pennsylvania) and Midwestern (mixed base) crudes. The reason for this is that the still residue obtained from naphthene base crudes gives an asphalt like material when further refined from which it is practically impossible to extract any crude petrolatum.

In the refining of the U S P petrolatum, the crude petrolatum is purified by a process technically known as adsorption. This, in principle, consists of bringing the crude petrolatum in contact with very porous materials such as fuller's earth, bone black, etc. The fine pores of the filtering material remove from the crude petrolatum all the impurities which give it color, odor and taste. The more often the purification process is repeated, the lighter will be the color of the petrolatum. Hence, the color range of petrolatum from amber to snow white.

The adsorption process is lengthy and tedious. Sometimes more rapid methods, such as treatment with strong chemicals, are used for refining petrolatum. By such methods, very light colors can be obtained, but it is often done at the sacrifice of the quality of the petrolatum because such chemicals destroy the proto substance present in the natural petrolatum. Such petrolatums in reality are thin liquids held together by an excess of wax.

Variation in Fibre Characteristics—It is often the belief of the pharmaceutical and cosmetic chemist that petrolatum is just petrolatum and that almost any petrolatum will do for a given purpose, as long as the color is about right. However, petrolatum is not such a simply defined product, but one which exists in a variety of different types. There are certain types of petrolatum of excessively long fibre characteristics which tend to make the finished product too sticky or stringy. The type of petrolatum used for most pharmaceutical and cosmetic preparations should be of medium but not short fibre. A very short fibre petrolatum is undesirable for most pharmaceutical and cosmetic uses since it is apt to result in a product of thin body, and it also lacks the smooth salve like consistency of petrolatum of medium fibre characteristics. Shortness of fibre is usually found in synthetic petrolatums and in petrolatum refined by chemical treatment.

In selecting the proper type of petrolatum for a given purpose, two further important properties should be considered, namely, melting point and consistency. These two properties of petrolatum are entirely independent of each other. In other words, a petrolatum can have a high melting point coupled with soft consistency, medium consistency or hard consistency.

Melting Point—While melting point is admittedly a consideration, its importance is often overestimated. The melting point of the finished product should be high enough to preclude its liquefying at summer temperatures. However, there is no additional advantage derived from the use of a petrolatum having a melting point higher than that.

Consistency Tests—Correct and uniform consistency is one of the most important factors in determining the suitability of a petrolatum for a given purpose. The consistency of petrolatum can be determined with an instrument similar to the asphalt penetrometer. The principle of this method, which has been adopted by the American Society for Testing Materials, is to determine the distance a steel cone penetrates under its own weight into the petrolatum. The softer the petrolatum, the deeper will the cone penetrate into it during a given time.

There is a still more sensitive method, the principle of which is to determine the time in seconds it takes for a plunger of lighter weight than that used in the A S T M method, to sink 1 inch into the petrolatum. This method is very accurate, because a very slight variation in con-

sistency of the petrolatum already causes a big difference in the time it takes for the plunger to penetrate 1 inch. Correct and uniform consistency of petrolatum is considered to day one of the most important characteristics of petrolatum.

Petrolatum Classifications—U S P petrolatum can be divided into three distinct types, according to melting point and consistency. Each type can then be subdivided according to color into individual grades.

Type No. 1 includes those petrolatums which have medium melting point and medium consistency. Type No. 2 are petrolatums of low melting point and soft consistency and, finally, Type No. 3 are petrolatums of high melting point and medium consistency.

The petrolatums of medium melting point and medium consistency—type No. 1—are the standard petrolatums of commerce and are used in largest volume. They are best suited for use in pharmaceutical salves, cosmetic creams, hair dressings, etc. Petrolatum of this type has a melting point of about 115–120° F. and is produced in different colors ranging from amber to an almost pure white.

Petrolatum of low melting point and soft consistency—type No. 2—is particularly recommended for repackaging in jars or tubes for resale as petroleum jelly for household use where a soft easy spreading consistency is desirable. It should be employed as the petrolatum base when a large amount of solid ingredients are to be added. This type of petrolatum, however, is not recommended when a large amount of liquid ingredients, such as white mineral oils, are part of the formula. The soft consistency and rapid liquefying properties of this petrolatum (which has a melting point of about 105–110° F.) makes it particularly suitable for salves of all kinds. It is often referred to as collapsible tube grade or ointment grade.

Type No. 3 (which has high melting point and medium consistency) is required only in those cases where the addition of liquids would otherwise reduce the melting point of the finished product to an undesirable degree. The melting point of these petrolatums is in the range of 125–130° F.

There is a fourth type of petrolatum characterized by high melting point and hard consistency. The usefulness of such petrolatum which has a melting point of about 130–135° F. is limited though there are certain applications for it in the cosmetic industry, as for instance, in the preparation of lip and paste rouges, etc. which should not be overlooked.

Selection of Correct Petrolatum Type—In making up any preparation in which the use of petrolatum is desirable or essential, it is necessary to investigate which type of petrolatum is best suited for a given purpose. Only in this way can the fullest benefit be derived from the use of petrolatum.

For example, in the formula for zinc oxide ointment, the Pharmacopœia simply specifies White Petrolatum, which means any U S P petrolatum of a color of lily white or lighter. However the 20% zinc oxide which is to be added to the petrolatum tends to stiffen up the finished ointment. Therefore a petrolatum of soft consistency should be used for this purpose, because it will compensate for the stiffening action of the zinc oxide. As another example in a phenol ointment, which should not be too soft, a petrolatum of medium consistency and medium melting point is the proper type to use. In the Pharmacopœia X, the hardening of an ointment was accomplished by specifying the use of paraffin wax or beeswax, whereas for softening purposes, the addition of white oil was prescribed. This procedure is not ideal. By adding a relatively large amount of paraffin wax or beeswax the structure and appearance of the ointment is unfavorably affected and it will not spread smoothly and evenly whereas the addition of oil may result in separation and sweating."

It is gratifying to note that the U S Pharmacopœia is recognizing the progress made in petrolatum refining by their proposed change of the official ointment formulas in the new Pharmacopœia. When these changes go into effect petrolatum will not only take the place of honzonated lard in all those formulas which still prescribe its use, but the pharmacist will be able to modify a given formula in such a way as to employ the type of petrolatum which requires the least amount of wax for hardening and the least amount of oil for softening. This also will enable the pharmacist to prepare ointments which will not be too soft in warm climates or too hard in cold climates. The empiric system of formulating many pharmaceutical and cosmetic preparations is always wasteful. Trial and error can be avoided once the function of a white mineral oil and petrolatum in a specific formula is understood.

At the close of the speaker's address members in the audience asked several questions regarding the use of kerosene oil in cosmetics and the use of petrolatums. At the close of the discussion a rising vote of thanks was recorded the speaker for his very interesting and instructive talk and the meeting adjourned.

RUDOLPH O. HAUCK, *Secretary*

PHILADELPHIA

The March meeting of the Philadelphia Branch, AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Philadelphia College of Pharmacy and Science March 12 1935, with Vice President Miller presiding.

The occasion of the evening previous to the meeting, was that of the annual dinner tendered by the members of the branch to its past presidents in honor of their loyalty to the organization.

Before seating the party Vice President Miller requested a period of silence in memory of the former presidents who during the past year answered their last call.

The following past presidents were in attendance, and each was called upon by the chair, for a word of greeting and a few appropriate remarks: W. A. Pearson, E. Fullerton Cook, Ambrose Hunsberger, J. W. E. Harrison, Adley B. Nichols, Martin S. Dunn, James C. Munch, Wm. J. Stoneback and Frank H. Fby. The remarks for the most part dealt with brief historical sketches of the association. After the dinner the members of the branch and guests assembled in the college auditorium for a business session.

The minutes of the last meeting were read and approved.

The treasurer's report was submitted with certificates of audit as rendered by Wm. J. Stoneback. The report showed a balance of \$155.79 plus a 10% payment from the closed Mutual Saving Company which is placed in a separate saving fund. On motion duly seconded and carried the report was accepted.

The resolution upon the death of William L. Cliffe was read, adopted and spread upon the minutes.

Vice-President L. L. Miller then introduced Dr. J. W. E. Harrison as the speaker of the evening. He gave a very interesting and informative lecture on the proposed legislative measures before the Federal government, namely, the Merce and the Copeland bills. Dr. Harrison very thoroughly and clearly gave a tabulated summation of the chief similarities and dissimilarities between the two bills and enumerated the complexities of certain phases of each bill. A short discussion followed the address, after which Ambrose Hunsberger presented the following resolution:

TO THE CONGRESS OF THE UNITED STATES

WHEREAS, it has become apparent that in order to afford adequate protection to the consuming public against fraud and deception the Food and Drugs Act now in effect needs to be expanded and strengthened; and

WHEREAS, several bills have been introduced into the Congress which are designed to achieve the above purpose, therefore

Be it resolved by Philadelphia Branch, AMERICAN PHARMACEUTICAL ASSOCIATION in regular meeting assembled that we endorse any legislation which provides adequate protection against the distribution of substandard or adulterated Foods and Drugs, and

Be it further resolved, that such legislation should provide methods for preventing and exploitation of Foods, Drugs and Cosmetics by false misleading, and deceptive advertising in whatever form, and

Be it further resolved that such legislation should require statements on the labels of containers setting forth the identity and percentage of the potent ingredients contained therein, and

Be it further resolved, that enforcement of the foregoing and all other provisions of Food and Drug Control enactments should be placed under the jurisdiction of the Food and Drug Administration in the Department of Agriculture.

Respectfully submitted,

Philadelphia Branch, AMERICAN PHARMACEUTICAL ASSOCIATION

E. H. MacLaughlin, *President*

G. E. Byers, *Secretary*

Said resolution to be placed on our records and a copy mailed to the proper authorities for delivery to the Federal Committee on said bills Motion was seconded, accepted and so ordered

A rising vote of thanks was then given to Dr Harrison for his timely lecture

Chairman James C Munch, of the Nominating Committee, reported a list of officers for the coming year The nominees were duly elected, they are *President*, Edmund H MacLaughlin, *First Vice President* L L Miller, *Second Vice President*, John N Woodside, *Secretary Treasurer*, George E Byers, *Delegate to the House of Delegates* Ambrose Hunsberger

GEORGE E BYERS, *Secretary*

STUDENT BRANCH OF ST JOHN'S UNIVERSITY COLLEGE OF PHARMACY

The regular meeting of the Student Branch of St John's University College of Pharmacy, A PH A, was held January 28th, President Arancio presiding The minutes of the previous meeting were read and approved The several committees presented their reports Chairman Matz, of the Committee on Program presented Mr Bellafiore the first speaker for the evening who discussed "The Pharmaceutical Possibilities of Dental Supplies," taking as a source for his material an article published in the last issue of the JOURNAL A PH A He recalled the coöperation between doctor and pharmacist of some years ago when pharmacists detailed doctors with suitable official preparations which the doctors subsequently prescribed

This was to their mutual benefit, he said, the doctor being assured of therapeutically active medicines and the pharmacist in being able to dispense standard non proprietary preparations The dentist who to day buys proprietaries through dental supply houses is often lured into using harmful products or products which masquerade under meaningless descriptive terms and whose true worth cannot be determined The pharmacist can not only protect him from these impositions but can replace these items with official products at lower prices " Mr Bellafiore concluded by mentioning several official substances that can be offered to the dentist among them were Mercury, Tincture of Iodine, Eugenol Liquefied Phenol and Compound Dental Liniment of Aconite

The next speaker was introduced by Professor Corcoran as Charles Harland Simpson, Jr, official representative of the United States Public Health Service His subject was "Pharmacy in Public Health Service" Mr Simpson outlined to an interested audience the growth of the service from 1798 when it was first established as a hospital for the care of seamen to its present indispensable activities in safeguarding the health of the nation

To day the Service consists of seven divisions headed by the Surgeon-General of the Public Health Service who is in turn under the jurisdiction of the Secretary of the Treasury The names themselves indicate the functions of the various divisions Division of Research Marine Hospitals, Mental Hygiene, Venereal Disease, Domestic Quarantine Reports and Vital Statistics Foreign and Insular Quarantine "

"Modern means of transportation " Mr Simpson pointed out "both inter-state and international can spread disease so rapidly that rigid inspection and quarantine are absolutely essential For example some one who had contracted a disease in some South American port would develop the symptoms of the disease in the two weeks on ship board whereas to day he is deposited in our country by plane in a few days before the disease has had time to make its appearance Then again trains carrying milk, water passengers, etc within our borders have to be watched To control these modern conditions the Division of Reports and Vital Statistics has available the condition of health of cities states and nations so that inspectors know whence to expect disease

"The service is quick to investigate health problems For example, its Research Division discovered the poisonous properties of knockless gasoline and prevented its use as a dry cleaner It traced to oysters grown in unsanitary beds an outbreak of typhoid in Chicago and caused legislation to be passed that oysters may be grown only in inspected beds Its work eradicated amebic dysentery and encephalitis almost completely

"In 1929 Narcotic Farms were established where drug addicts are sent for a cure which consists largely of gradual withdrawal of the drug and instruction in personal hygiene This led to the formation of the Division of Mental Hygiene which in addition cares for morons and Federal prisoners

"Lepers are sometimes discovered in this country Without publicity these are withdrawn to hospitals where they are treated The Service provides standards for biologicals and vaccines It inspects immigrants It controls the proper neutralization of arsphenamine

"Pharmacists perform an important part of this work After a preliminary training they are named administrative heads of Marine Hospitals, direct crews in fumigating ships from diseased ports to kill rats or act in their professional capacity They are admitted to the service only with a B S in Pharmacy degree after passing written and oral examinations in academic, business and professional subjects

"The Service is the first part of our Government to recognize the pharmacist with a Commission Pharmacists will act as administrative coordinators throughout the country in the proposed social security program "

At the conclusion of his talk Mr Simpson was given a vote of thanks

ADA J BIZZARRI, *Secretary*

PROGRAM

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE *

PROGRAM—SECTION N (MEDICAL SCIENCES) SECTION N3 (PHARMACY)

Thursday, June 27, 1935 10 00 A M to 12 30 P M¹

John C Krantz, Jr, Counselor—to the American Association for the Advancement of Science from the AMERICAN PHARMACEUTICAL ASSOCIATION—Presiding

Gustav Bachman Counselor—to the American Association for the Advancement of Science from the AMERICAN PHARMACEUTICAL ASSOCIATION—Local Secretary

The assignments are 15 minutes for each presentation

1 "Studies on the Penetration of Antiseptics in Living Tissues " By Arthur D Hirschfelder and Milan Novak, Department of Pharmacology, School of Medicine, University of Minnesota

2 "A Study of *Cracca Virginiana* L " By Lawrence F Madland and Arthur H Uhl Department of Pharmaceutical Chemistry, University of Wisconsin

3 Colloidal Properties of the Arsphenamines in Relation to Toxicity and Therapeutic Efficiency " By Harold N Wright, Department of Pharmacology, School of Medicine, University of Minnesota

4 "The Fate of the Sugar Alcohols and Their Anhydrides in the Animal Body " By John C Krantz, Jr, C Jelleff Carr and Ruth C Musser, Department of Pharmacology, School of Medicine, University of Maryland

5 "The Application of the Shaffer Smogyi Method in the Study of the Deterioration Rate of Tincture of Digitalis and a Physical and Pharmacological Investigation of the Absorption of Glucosidal Complexes Present in Tincture of Digitalis " By Earl B Fischer, R A Gortner and Charles E Rogers, Department of Pharmacy and Biochemistry, University of Minnesota

6 "The Microscopy of Powdered Desiccated Endocrine Glands " By Heber W Youngken, Department of Pharmacognosy Massachusetts College of Pharmacy

7 "A Physicochemical and Pharmaceutical Contribution to the Solubility of Boric Acid in Water " By George Grossen and Gustav Bachman, Department of Dispensing College of Pharmacy, University of Minnesota

8 "The Effect of Certain Sugar Alcohols and Their Anhydrides in the Disassociation Constant of Boric Acid " By Margaret Oakley, C Jelleff Carr and John C Krantz, Jr, Bureau of Chemistry, State of Maryland Department of Health, and Department of Pharmacology, School of Medicine, University of Maryland

* Minneapolis, Minnesota

¹ Meeting Room to be announced later

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1934-1935

Office of the Secretary, 2215 Constitution Avenue, Washington, D C

LETTER NO 13

February 4 1935

To the Members of the Council

71 Meeting of the Executive Committee
Upon the call of Chairman Hilton a meeting of the Executive Committee of the Council was held at 2215 Constitution Avenue, Washington D C, on Saturday January 5 1935 to consider the following matters and any other business that should properly come before the Executive Committee

Report of the Special Committee to confer with a Special Committee from the N A R D

Relation of the A Ph A to the National Drug Trade Conference

Report of the Committee on Maintenance
Report of the Committee on Publication—
National Formulary Recipe Book,
Pharmaceutical Abstracts

Representation of the A Ph A on the
National Retail Drug Code Authority

The minutes of the meeting are as follows

The meeting was called to order by the Chairman at 10 20 A M with the following members present Army, DuMez, Dunning Eberle Fischelis Hilton, Holton, Kelly LaWall and Philip Chairman Hilton stated that J H Beal as vice chairman of the Council and R L Swain as a member of the A Ph A - N A R D Joint Committee had been invited to attend the meeting—Dr Swain was present at both sessions and Dr Beal attended the afternoon session

Messrs Fischelis, Swain and Kelly submitted a verbal report as the A Ph A representatives on the A Ph A N A R D Joint Committee and the following minutes of the first meeting of the Joint Committee and requested that they be given any instructions thought advisable with respect to the several subjects under consideration by the Joint Committee

The first meeting of the Joint Committee representing the A Ph A and the N A R D was held at the Hotel Washington Washington, D C on Wednesday December 5 1934 beginning at 8 15 P M The meeting was postponed from Tuesday December 4, 1934, be-

cause Mr Dargavel found it impossible to be present

All members of the Joint Committee were present Charles Ehlers, John W Dargavel, Thomas S Smith for the N A R D, and Robert P Fischelis Robert L Swain and E F Kelly for the A Ph A

By agreement Robert P Fischelis acted as chairman and E F Kelly as secretary

After an interchange of greetings the Joint Committee proceeded to a consideration of the matters referred to it by the annual meeting of the Council A Ph A and the Executive Committee N A R D

After a lengthy discussion of the relations between the two Associations and between them and the State Pharmaceutical Associations, during which particular attention was given to the membership of the three groups, to the formation of Conferences of State Associations, and to the necessity for unifying the forces of the three groups, and providing for the effective representation of pharmacists, it was unanimously agreed

1 That the proposal to consolidate the A Ph A and the N A R D was disposed of for the present by a formal resolution adopted by the N A R D at its recent meeting in New Orleans

2 That although the proposal for some form of affiliation between the two Associations did not appear to be practical under the existing conditions and in view of the apparent need for separate organizations to deal with the professional and economic problems of pharmacy, an effective plan of coöperation should be worked out

3 That some practical plan of federating the State associations with the A Ph A and the N A R D more closely than is now the case is necessary

4 That the Committee favors the further consideration of the suggestion that a plan be worked out for federating the State associations with both national associations by providing that members of each State association become automatically members of the national associations on a single membership fee plan

Arrangements were made for a meeting of the Joint Committee early in January, pref-

cably on the 8th, to further develop the plan to which representatives from the Conference of Pharmaceutical Association Secretaries, representing the State associations, will be invited

With respect to Pharmacy Week it was agreed

1 That the A P H A should take the leadership and should appoint the Committee on Pharmacy Week including several representative members of the N A R D

2 That the two Associations should award a joint certificate to the ten best window displays after the first award

3 That the annual appropriations of \$250.00 each from the A P H A and N A R D be continued and increased as rapidly as possible

4 That as many carefully selected advertisers as possible be requested to give a definite time for Pharmacy Week on the radio and to provide them with a program

After a general discussion of U S P and N F Publicity, it was the sense of the Committee that the A P H A should direct this effort and that it should collect information about the work being done in the various States and work out a standard plan for promoting the use of official preparations.

It was agreed that First Aid Week should be directed by the N A R D, and that the A P H A should assist in so far as possible

The meeting adjourned at 11:00 P M to meet at 10:00 A M on December 6th, with the understanding that the chairman and secretary would prepare for consideration at that time, a statement to be sent to the pharmaceutical press

The meeting reconvened at 10:00 A M on December 6th, with all members present except R L Swain

After several changes were made, it was agreed that the statement, of which a copy is attached, should be issued by the secretaries of the two Associations

The meeting then adjourned

The forenoon session was devoted to a discussion of federation and of joint membership in the A P H A, the N A R D, and the State associations on a single membership fee or otherwise. A letter that Dr Dunning had addressed to the secretary, on this subject, was read and it was requested that a copy of it be sent, with these minutes, to each member of the Council. President Fischelis explained his plan for federation and joint membership

on a single membership fee and stated that this plan would be given in his address to be delivered at the testimonial dinner to him in New York on January 10th

After all present had expressed their views, it was agreed that the representatives of the A P H A should attend succeeding meetings of the Joint Committee with an open mind on the subject and should cooperate in the investigation and consideration of any proposed plan for federation on a single membership fee or otherwise for submission to the respective associations

Adjournment was taken at 1:00 P M for lunch and the afternoon session was called to order at 2:10 P M

72 *Committee on Maintenance* Chairman Dunning submitted a verbal report that the sum of \$109,568.00 has been subscribed to the Maintenance Fund of which \$61,707.00 had been paid. Of this total \$50,000.00 was in the form of a bequest by will. The subscriptions to this fund were being segregated from those to the Headquarters Building Fund with the exception of one cash subscription of \$50,000.00 the donor of which had specified that it might be used for paying off any indebtedness on the building and equipment. All indebtedness including the note for \$40,000.00 with the Maryland Trust Company has been paid leaving the project entirely free of debt excepting a balance of \$1000.00 due on the planting, and with a cash balance of about \$10,000.00. The mortgage of \$36,400.00 on Lot No. 7, which Lot the Association had found it necessary to buy in order to secure Lots Nos. 12, 13, 14 and 15 from the George Washington University, could be continued at 5½% or might be refinanced for an indefinite period at 4½%. This mortgage was amply protected by the bequest referred to above.

Chairman Dunning said that the work of his Committee would be continued as opportunity presented and requested assistance in securing funds for special purposes such as the library, museum, etc., and for special services that could be carried on in the building.

In reference to the exemption from taxation Dr Hilton reported that although final action had not been taken by the Board of Commissioners due to the recent change in administration, he had been assured that the matter would have attention at an early date.

Chairman Dunning reported that he and the secretary had given consideration to the suggestion made at the meeting of the Executive

Committee on July 17th, that special committees be provided to cooperate in connection with the Library and the Museum. As the Council was charged with the custody of the property, funds and publications of the ASSOCIATION, it appeared to be the duty of the Council to select these committees and to decide on their duties. After a general discussion it was moved by Kelly that a special Committee on Library and a special Committee on Museum be created by the Council, membership not to be limited to the Council and to be selected with special reference to their knowledge and experience, to study the development of the library and museum, respectively, and to submit plans with respect to each. The motion was seconded by Holton and carried. It was moved by Army that the members of these Committees should be chosen by nomination and vote of the Council. The motion was seconded by Fischelis and carried.

On motion of Holton-Army, the report of the Committee on Maintenance was received with thanks to Chairman Dunning for his services.

73 Committee on Endowment Chairman Beal reported that he had contributed \$1000.00 to this fund in 4% bonds, that the bonds would be delivered at an early date and that efforts would now be made to further increase this fund. The report was received on motion of Holton-Kelly, with thanks to Dr. Beal for his contribution.

74 Relation of the A. Ph. A. to the National Drug Trade Conference Referring to recent discussion of this subject, Dr. Beal who was at that time general secretary of the ASSOCIATION, reviewed the actions leading to the establishment of the Conference and to the purposes which it was intended to serve. It was not expected that there would be unanimity of opinion or of action with respect to all matters brought before the Conference but that there would be friendly consideration of them and cooperation on those which were found to be of mutual interest. Although there had been criticism of the Conference and of its work, he felt that it had served and could serve a useful purpose in providing a meeting ground for the member associations, representing every division of pharmacy and the drug trade as had been intended by the A. Ph. A. in proposing the Conference.

A lengthy discussion followed with particular reference to the last annual meeting of the

Conference and the position of the A. Ph. A. on matters which the Conference was now dealing with, notably Food and Drug Legislation. No action was considered to be necessary.

75 Committee on Publications Chairman DuMez said that the Committee was now faced with several questions which could not be satisfactorily considered and decided by correspondence.

With respect to the *National Formulary, VI*, the work of revision was nearing completion, the contract for printing and binding has been awarded and page proofs were now being distributed. Recommendations had been made by his Committee to the Council that invitations for bids on the distribution and sale of the N. F. VI be issued to a selected list of firms under specifications and proposal as submitted and that the retail selling price be set at \$5.00 per copy in buckram and at \$7.00 per copy in leather (see Council Letter No. 8, pages 1245 and 1246). Although these recommendations had received the approval of a majority of the members of the Council, some objection had been voiced to the proposed price of \$5.00 for the N. F. VI in buckram. The reasons for the suggested increase had been given in Council Letter No. 8, and were reviewed.

After a full discussion of the question the vote on Motion No. 12 by which the retail selling price of the N. F. VI was set at \$5.00 per copy in buckram and at \$7.00 per copy in leather and the retail selling price of the *Pharmaceutical Recipe Book* was set at \$5.00 per copy in buckram was confirmed, on motion of Philip Holton. Dr. Fischelis asked to be recorded as voting "No" on the price of the N. F. VI in buckram.

With respect to the *Pharmaceutical Recipe Book* Chairman DuMez reviewed the progress of the revision and explained the difficulties that were being met with and the steps being taken to deal with them. It was not intended to issue the second edition until after the appearance of the U. S. P. XI and the N. F. VI. The contract for printing and binding R. B. II had not been let as it is not yet known how many of the present plates can be used again. The arrangements that had been made with Mrs. Kassner to act as Editor of the second edition were also explained. Mrs. Kassner had undertaken to complete the work under the direction of Chairman Lascoff as far as possible before her return to England late in February and to attend to the remainder by

correspondence and desired to leave the matter of payment for decision after the work was done

Chairman DuMez stated that at a conference with Chairman Lascoff and Secretary Kelly, it had been decided that a meeting of the full Committee on Recipe Book would not be required but that a meeting of certain members would be necessary later. It was believed that the expenses of this meeting and other incidental expenses would be covered by the present appropriation of \$500.00 in the budget and that \$500.00 should be added to the appropriation to cover the cost of editing. On motion of DuMez Arny, \$500.00 was added to appropriation for the *Recipe Book* in the 1935 budget.

With respect to the *Publication of Changes in the N F VI* Chairman DuMez submitted parts of the report covering the changes as prepared by Chairman Gathercoal and explained the estimated cost of publishing the entire report. After a general discussion it was moved by Philip that while greatly appreciating the fine work done in preparing the abstracts of the proposed changes in the N F VI, the Council believes that in the present financial condition of the ASSOCIATION the large expense that will be necessary in printing these changes and the small amount of space available in the JOURNAL, makes the publication impractical at this time. The motion was seconded by Arny and carried.

With respect to the *Publication of Abstracts in the A Ph A Journal* Chairman DuMez reviewed the recommendations made by the Special Committee on Year Book in 1933 and which were referred to the Committee on Publications for action and stated that the latter committee was arranging to publish the abstracts for 1935 in the JOURNAL beginning with the March issue. They would be printed in forms of 32 pages separately numbered and following "Editorial Notes" in order that these pages could be removed for separate binding if desired. The ASSOCIATION data and roster of members can be printed in one issue of the JOURNAL and it is planned to have several hundred of the YEAR BOOKS bound in the present style for sale to libraries and others interested in continuing the series. This would provide a total of 384 pages per year for abstracts which approximates the number of pages used in the YEAR BOOK. It is proposed to pay the abstractors at the rate of \$2.00 per page in English and \$3.00 per page for other

languages. On motion of LaWall Arny the Committee was authorized to proceed with the publication of abstracts in the JOURNAL on the plan proposed.

Following the meeting of the Executive Committee Chairman DuMez wrote that in order to have a complete record, he would submit the plan for publication of the abstracts, as outlined on page 45, to the members of the Committee on Publications and has advised that the following has been approved by the Committee.

Several years ago the Council of the A Ph A appointed a Special Committee on Year Book at my request, to make recommendations with respect to the nature and number of articles to be abstracted and with respect to the future disposition of these abstracts. There has been a demand which has become more and more urgent in recent years that these abstracts be made available to the members much sooner than they have been in the past.

This Special Committee made a careful study of the situation and rendered a written report to the Council on two consecutive years. The second report made certain definite recommendations among which was that the abstracts should be published monthly in the JOURNAL. The Council approved this recommendation and authorized the Publication Committee to put it into effect just as soon as the affairs of the ASSOCIATION would permit. We are now ready to carry out these recommendations and the essential details of the plans which have been made for doing so and which are now submitted to you for approval are as follows:

1. The abstracts will be carried as a section in our JOURNAL immediately following the editorial notices and preceding the advertising section. The pages of this section will be numbered separately so that they can be taken out from the other material, combined with the ASSOCIATION data and the indices to make what would be essentially the YEAR BOOK as we now know it.

"2. In making the new contract for the publishing of the JOURNAL a provision was made to include a 16 page form in each number of the JOURNAL or 32 pages on which to carry these abstracts. This will give us a total of 384 pages or approximately the same number of pages as has been devoted to this purpose in the YEAR BOOK.

'3 It is planned to set a definite rate of compensation for the preparation of abstracts. This has been set at \$2 00 per printed page for abstracts prepared from publications in the English language, and \$3 00 per printed page for abstracts prepared from articles published in other languages. The rate is about the same as that which has been paid for abstracting in the past where it was found necessary to pay anything at all for this service.

'4 I am informed by the Lord Baltimore Press, the company which has the contract for publishing the 1933 volume of the YEAR BOOK, that the new arrangement will effect a saving in publication of approximately \$600 00 to \$700 00. I doubt, however, if the ASSOCIATION will gain to this extent, as the new arrangement will very likely bring new expenses that have not been anticipated.

' Please let me have your vote on this matter promptly as we have no time to waste if the first abstracts are to appear in the March number of the JOURNAL."

With respect to the YEAR BOOK, Chairman DuMez stated that Volume 22, for 1933, is being printed and that the copy for Volume 23, for 1934, will not be completed for about six months. It had been recommended to hold Volume 22 until Volume 23 is completed and issue them in one binding but it was felt that the delay would bring criticism.

After discussion and on motion of Arny-LaWall the Committee was authorized to proceed with the publication of Volume 22 of the YEAR BOOK.

Messrs Dunning, Fischelis and Holton requested to be excused at this time as they had to leave the meeting.

76 *Representation of the A Ph A on the National Retail Drug Code Authority.* The Chairman stated that this subject had been included in the program to provide an opportunity for a full consideration of it.

The Secretary reported that a letter had been received from NRA since the last meeting of the Executive Committee, outlining certain necessary changes in the By-Laws of the ASSOCIATION respecting membership if the ASSOCIATION is to be permanently represented on the National Retail Drug Code Authority and that NRA had been advised that the ASSOCIATION would not meet until August 1935 when the proposed changes would be considered. In the meantime the secretary continued to serve as temporary representative

of the A Ph A on the Code Authority and as its secretary-treasurer.

Referring to the discussion of the subject at the meeting of the Executive Committee on July 17th, the secretary stated that he had believed it necessary to continue his additional work on the Code until the Loss Limitation provision and the Budget of the Code Authority could be settled, which had been delayed much longer than had been expected. Decision on the former question had been reached on September 21st, and on the latter on December 13th. At the December meeting of the Code Authority, he had therefore requested to be relieved of the work additional to membership on the Code Authority, through the employment of an accountant to take charge of the budgets, which was done promptly, and by the selection of some one to take full charge of the work of the Code Authority which will be done as soon as possible.

The Secretary estimated that at certain periods the Code work had taken up as much as one-third of his time, much of which, however, could be made up and stated the amount of salary which the Code Authority had paid him on account of the additional work all of which salary payments had been deducted from his salary from the A Ph A.

It was the general opinion that the secretary should be relieved of this additional work as promptly as satisfactory arrangements can be made and it was understood that the secretary will advise the Council of these arrangements as soon as they can be completed.

No action was taken by the Committee.

NOTE The members of the Council have been furnished with further details in this connection through copies of correspondence between the president and the secretary.

On motion of LaWall Philip the meeting adjourned at 7 20 P M.

(Motion No 27) *It is moved by Kelly that the Minutes of the Executive Committee as presented herewith be approved by the Council and that the actions of the Executive Committee be come the actions of the Council.*

A vote on this motion will be called for in about ten days.

The Secretary is now prepared to report that Mr W S Elkins of Decatur, Georgia, was elected as Executive Secretary of the National

Retail Drug Code Authority and took up his duties on March 15, 1935. Mr. Elkins will have charge of the office of the Code Authority and of its administration.

The Secretary will continue as a member of

the Code Authority, representing the A. P. H. A. until further action of the Council and as secretary-treasurer of the Code Authority and will act in an advisory capacity.

E. F. KELLY, Secretary

COMMITTEE REPORTS

REPORT OF COMMITTEE ON WEIGHTS AND MEASURES

It was the thought of President R. L. Swain and others that the work of this Committee should be coordinated very closely with that of the Committee on Prescription Tolerances. It is recognized that the accuracy of prescription compounding depends in no small measure on the accuracy displayed in weighing and measuring quantities of ingredients. Unless balances, scales, weights, graduates and other weighing and measuring devices are accurate, it is impossible to provide accurate compounding and dispensing.

In order to determine the present status and accuracy of the weighing and measuring devices in the pharmacies throughout the United States, it was decided to address the Department of Weights and Measures of each state and ask for information as to what supervision is exercised by the state over weighing and measuring devices in retail drug stores. These departments were also requested to supply copies of their annual reports and any information which they might have in their possession bearing upon the questions in which the Committee is interested.

As a result of communications addressed to the 48 states on this subject, a variety of replies was received, consisting in most instances of copies of laws and regulations and in a few instances of reports and comments.

It appears that the economic wave which has overtaken state activities, has resulted in a curtailment of the publication of reports by various departments.

No replies of any kind were received from the States of Alabama, Colorado, Idaho, Illinois, North Carolina, Rhode Island and Washington, although several follow-up letters were sent.

The following states indicated that drug store weighing and measuring devices are in a satisfactory condition: California, Florida, Georgia, Nevada, Oregon, South Carolina and Utah.

The following states have no Departments of Weights and Measures: Louisiana, Mississippi and Missouri.

In Oklahoma, the activities of the Weights and Measures Department are handled by the State University.

In New Jersey, the Department of Weights and Measures reported as follows:

"For the fiscal year ending June 30, 1933, 513 prescription scales were examined of which 472 were found accurate, 32 required adjustment and 9 were condemned.

'Four thousand fifty-seven (4057) metric weights were examined of which 3804 were found accurate, 185 required adjustment and 68 were condemned.

"Two hundred and seventy-one (271) troy weights were examined of which 236 were found to be accurate, 21 required adjustment and 14 were condemned.

"Eight thousand four hundred and eighty-eight (8488) apothecary weights were examined of which 6943 were found accurate, 539 required adjustment and 966 were condemned.

Three thousand one hundred and forty-six (3146) glass graduates were examined of which 3020 were found accurate and 126 were condemned."

In the State of Wisconsin for the fiscal year ending June 30, 1932, seven hundred and thirty-five (735) prescription weights were examined of which 19 were adjusted, 23 condemned for repairs and one condemned.

In the District of Columbia for the year ending June 30, 1933, four hundred and forty-one (441) prescription scales were examined and tested. Of these 412 were approved with adjustment, 44 were tested and 27 were condemned for repairs and one was confiscated.

For the same period 7965 prescription weights were tested of which 7754 were approved and 211 were confiscated.

The following comment of the Superintendent of Weights, Measures and Markets of the District of Columbia on the situation in the District is pertinent "When this department began testing prescription scales and weights several years ago many of them were found in very bad condition, but, due largely to the annual inspections made conditions with regard to such scales and weights have greatly improved"

We all know that if inspections are made in any field of activity conditions are good. When no inspections are made, conditions are apt to be bad because of the carelessness which results from the knowledge that no one is checking up or policing a given situation.

It is a well-known fact that the quality of drugs and medicines dispensed improves when there is knowledge that the products are subject to inspection and test. The same holds true for weights and measures or any other activity.

The Chairman of your Committee feels that a general survey of reports of state county and municipal departments of weights and measures should be made to determine, so far as possible, the conditions of weights and measures in the pharmacies of the United States. When this survey has been completed an effort should be made to call to the attention of the pharmacists of the United States such facts and figures as may be developed, and recommendations should be offered to improve the situation, if necessary. Our report this year is therefore in the nature of a progress report, and it is suggested that the incoming committee continue the work that has been undertaken endeavoring to provide as complete a survey as possible of the situation in the near future.

(Signed)

ROBERT P. FISCHER, *Chairman*

DEATH OF MRS. F. C. GODBOLD

Mrs. Elizabeth Godbold, widow of our late member, F. C. Godbold, New Orleans, died at the home of her brother, Dr. H. V. Army, Montclair, N. J., April 9th, aged 77 years.

EDITORIAL NOTES

REPORTS OF THE INTERNATIONAL CONGRESS OF MILITARY MEDICINE AND PHARMACY

Through the courtesy of Major General H L Gilchrist, editor of the *Military Surgeon*, the Library of the AMERICAN PHARMACEUTICAL ASSOCIATION has received reports on the Congress of Military Medicine and Pharmacy for 1923, 1925, 1927, 1929, 1931 and 1933. All of the foregoing reports were made by William Seaman Bainbridge, Captain M C F, United States Naval Reserve. These meetings were held consecutively, in the order given above, in Rome, Paris, Warsaw, London, The Hague and Madrid.

On behalf of the ASSOCIATION thanks are extended to those whose names are mentioned herewith.

S L HILTON, REMINGTON MEDALLIST

Announcement has been made by Secretary Dr Hugo H Schaefer, of the election of S L Hilton to receive the Remington Honor Medal for 1935. He is chairman of the Council and a former president of the A P H A and treasurer of the Pharmacopoeial Convention.

S L HILTON

During the erection of the American Institute of Pharmacy, Dr Hilton made a daily visit to the site and was helpful in many ways.

prior to the construction of the headquarters. Further reference to the recipient of the award will be made in due time.

DEAN C B JORDAN HONORED

At the close of the banquet and program of the Fifth Annual Druggists Business Conference, recognition of Dean Jordan's twenty five years of distinctive service as the Dean of Purdue University, School of Pharmacy, was made a special feature. The members of the faculty of Pharmacy presented Dean Jordan with a handsome illuminated parchment. The program was under the direction of President E C Elliott.

Tributes were made in short addresses by President Robert P Fischelis of the AMERICAN PHARMACEUTICAL ASSOCIATION, F V McCullough, secretary of the Indiana Pharmaceutical Association, President E A O Harrow, of the Indiana Board of Pharmacy, and J K Lilly.

THE TWELFTH INTERNATIONAL PHARMACEUTICAL CONGRESS

Among the subjects that will be considered at the Twelfth International Congress are the following: The medico pharmaceutical scope, the limitation of pharmacies, pharmaceutical regulations—control of patent medicines and prices to be charged, management of pharmacies, pharmaceutical service in social insurance, the question of employment in pharmacies, pharmaceutical terms.

INTERNATIONAL CONGRESS OF HOSPITALS

The Fourth International Congress of Hospitals will be held in Rome, May 19-26, 1935. An elaborate program has been prepared and reduced rates will be effective. The Secretary General is Dr Edoardo Licorio, Ospedale S Spirito, Rome.

IDAHO ENLARGES PLANT GARDEN

Drug plants from many parts of the world are now being grown in the greenhouse of the campus of the University of Idaho, southern branch. This extensive plant cultivation was made possible by the Government's F E R A funds for employing undergraduate pharmacists to care for the garden.

The purpose of the experiment, according to Prof E O Leonard, director of the division of pharmacy, is to determine the possibilities of increasing the medicinal content of drug plants.

PERSONAL AND NEWS ITEMS

The address of President Robert P Fischelis, of the AMERICAN PHARMACEUTICAL ASSOCIATION—before the Third Annual Pharmaceutical Conference of the College of Pharmacy, of the University of Michigan—was published in *Science* of March 29th

Dr Charles R Mann as director for 12 years of the American Council on Education is to be honored on May 3rd by that organization This will be the 18th annual meeting and the general topic, "Unoccupied Areas in Education" The speakers will be Sidney B Hall Richmond, Rev George Johnson, of Catholic University, John G Bowman, University of Pittsburgh, Harold G Campbell, New York City, William F Ogburn, University of Chicago, A S Pratt, W W Charters and Fred B Robinson, College of the City of New York

It is contemplated to build a new Naval Hospital in Washington, located on the site of the present Naval Medical Center at 23rd Street and Constitution Ave The new facilities would include space for the Medical School and the Naval Dispensary, in addition to the regular hospital building The site is immediately opposite to the AMERICAN INSTITUTE OF PHARMACY

Adolph S Ochs, publisher of *New York Times*, died April 9th His remarkable record and influence as a publisher commanded attention and respect, for to a very large extent the insistence of factual accuracy as a basic standard of reputable journalism in the United States was due him All publications and the readers owe him a debt of gratitude

Harry L Schrader, Baltimore, has donated a letter of H P Hynson accepting membership in the Wedgewood Club and thanking the father of Mr Schrader for his interest, a number of the *Druggists Circular*, October 1874 The latter contains a report of the Louisville meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION, John F Hancock president Among other items is a National Formulary of 1838 belonging to A P Sharp, also a number of bottles of fluidextracts and granules a glass mortar sign and a set of troy weights—16 ounces to 1½ ounce

Ambrose Hunsberger, Jr, son of our fellow-member has been placed in charge as chief of the research division of John Wyeth & Bro Mr Hunsberger attended Philadelphia College of Pharmacy and Science, is a graduate of Princeton University, and continued graduate

work at the University of Pennsylvania Recently, he has been on the staff of the Biochemical Department of Philadelphia General Hospital

Dean D B R. Johnson was honored by members of the faculty and friends on April 5th, in commemoration of his fifteen years of deanship of Oklahoma School of Pharmacy Herman Jones was chairman of the committee on invitations Prof Ralph Bienfang has been active in the arrangement and President Clyde Miller has appointed a committee on the memorial

John P Jelinek, prominent St Paul retail pharmacist, was injured severely when struck by an automobile After Mr Jelinek had recovered sufficiently to be taken home from the hospital, Mrs Jelinek suffered a fall resulting in a severe leg injury Both, however, are recovering rapidly

Dr F E Stewart and Warren H Poley were the honored guests at the annual Founders Day of the Philadelphia College of Pharmacy and Science Dr Stewart graduated in 1876 and Mr Poley in 1875 Dr F E Stewart was for many years chairman of the Committee on Patents and Trade Marks of the AMERICAN PHARMACEUTICAL ASSOCIATION and in many other ways contributed valuable work to the ASSOCIATION and in the establishment of the Council on Pharmacy and Chemistry

James E Hancock, chairman of the Procter Memorial Fund Committee, is heading the movement to have the Frigate Constellation reconditioned and brought to Fort McHenry and become part of the Museum being established at the Fort, in the restoration of which Mr Hancock has been very active in fact the leader This is now a National shrine and the active part which Baltimore had during the history of the Constellation suggests its location here

Dr A R Bliss, Jr, dean of the School of Pharmacy of Howard College at Birmingham, Ala, will read a paper before the International Physiological Congress in Leningrad and Moscow in August 1935 Dr and Mrs Bliss will be members of a group of physicians headed by Dr J S McLester, *President-Elect* of the American Medical Association and Dr A J Carlson of the University of Chicago, they leave Chicago on their journey July 25th

Dr Paul N Leech was the speaker at the meeting of Chicago Branch A Ph A, April

16th, on the subject "Some Topics of Interest to the Pharmacist and Physician"

Dean Ernest Little, of the Rutgers University College of Pharmacy, will be honored at a testimonial dinner here on May 20th, in recognition of his service to pharmacy as president of the American Association of Colleges of Pharmacy

The dinner, to be held at the Hotel Robert Treat, is being sponsored by the Northern New Jersey branch of the AMERICAN PHARMACEUTICAL ASSOCIATION and the Alumni Association of the Rutgers University College of Pharmacy. Oscar Scholz, Jr., is in charge of reservations for the event.

Magazine sections of the Sunday papers (April 14th) carried the story of the expedition

of Clyde Eddy through the canyons of the Colorado. It is a well told thrilling story. Relative to the dangers and experiences in the Grand Canyon, as most of our readers know, Mr. Eddy gave a series of illustrated lectures on the subject. He is also known to members for his interest in the ASSOCIATION work.

Our fellow member J. Leon Lascoff, has made an extensive purchase from the John W. Wainwright collection of drug jars and mortars. The mortars range from the 16th to the 19th century and are largely of English, French and Spanish design. The drug jars range largely about 1800 and all of them are interesting specimens—the purchaser has these on display in his pharmacy.

SOCIETIES AND COLLEGES

THE INTER SOCIETY COLOR COUNCIL

The annual meeting of the Inter Society Color Council was held at Columbia University College of Pharmacy, New York City, on February 21st. The AMERICAN PHARMACEUTICAL ASSOCIATION was represented by Dr. H. V. Army as official delegate. E. N. Gathercoal was a delegate of the U. S. Pharmacopoeia.

ACADEMY OF SCIENCES AND AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

The annual stated meeting of the National Academy of Sciences will be held under the presidency of Dr. W. W. Campbell in the building of the academy at Washington on April 22nd, 23rd and 24th. The autumn meeting will be held at the University of Virginia on November 18th, 19th and 20th.

The spring meeting of the Executive Committee of the American Association for the Advancement of Science will be held in New York City.

DOCTORS AND DRUGGISTS' MEETING

Over 100 doctors, hospital workers, nurses and druggists attended the first annual get together party sponsored by the San Angelo (Texas) Retail Druggists' Association. Members of the Tom Green (Eight) County Medical Society were guests of honor.

OFFICERS OF THE DISTRICT OF COLUMBIA PHARMACEUTICAL ASSOCIATION

The following officers were elected by the District of Columbia Pharmaceutical Association:

President, A. C. Taylor, *Vice Presidents*, J. G. Biggs, F. M. Campbell, M. Goldstein, G. W. Mathews, T. A. Moskov, H. J. Wener, *Secretary*, Treasurer, W. Bruce Philip.

At the meeting on April 9th, pictures were shown illustrating the manufacture of glass ware by Whittall Tatum Co. and it is the aim of the Association to continue programs of pictures illustrating manufacturing processes.

THE NEW YORK PHARMACEUTICAL COUNCIL

The New York Pharmaceutical Conference has been reorganized and since April 1st the organization is now known as the New York Pharmaceutical Council made up of local pharmaceutical associations, fourteen such local groups are represented in the Council.

The convention was addressed by Hugo Mock and Secretary E. L. Newcomb of the National Wholesale Druggists' Association, and George W. Mather, Secretary of the New York State Board of Pharmacy. The following officers were elected:

President, F. L. Grennie, New Dorp, Staten Island, *Vice Presidents*, Henry Dansen, the

Bronx, Joseph Setaro, Long Island City, and Harry Brode Flushing, *Secretary*, Hugo Schaefer, Manhattan, *Treasurer*, Fred G A Schaefer, Brooklyn, *Members of the Board of*

Governors—George Gotteman, Brooklyn, Dr C P Wimmer, Manhattan, Morris Brodtkin, the Bronx, Charles Timen, Queens County and Edward McCrum, Richmond County

LEGAL AND LEGISLATIVE

CODE EXTENSION

At the time of this writing the Senate is continuing its study of the operation and effects of the NRA. The officials are determined to keep the code structure intact and workable pending passage of new legislation to extend the law beyond June 16th.

COPELAND BILL DEFERRED BY SENATE

Senate action on the Copeland food and drug bill (S 5) was indefinitely postponed when its author Senator Royal S Copeland of New York, asked that it be placed back on the calendar rather than passed as amended. This action was taken after a brief but stormy session in which the Senate adopted, by a vote of 44 to 29, an amendment, offered by Senator Josiah Bailey of North Carolina, to prevent multiple seizures on charges of misbranding which did not involve imminent danger to health. Earlier, Senator Copeland had announced that he would prefer no new legislation to such action and after adoption of the Bailey amendment he made good his threat by having the measure placed back on the calendar.

PRICE CONTROL BILLS IN CONGRESS

A bill to restrict the price discrimination section of the Clayton Act has been introduced in the house by Representative Carl Mapes of Michigan. This bill would amend Section 2 of the act by striking out all of the qualifications of the rule against price discrimination, which have made the act difficult to enforce. These qualifications include necessity of proving creation of a monopoly and provide for price differences based on quality or quantity or to meet competition. The Mapes bill (H R 4995) would make it unlawful for any person engaged in commerce either directly or indirectly to discriminate unfairly or unjustly in price between different purchasers of commodities within the jurisdiction of the Federal government. H R 6246 has been introduced by Representative Compton I White of Idaho. This would make it unlawful for any manufacturer to charge dif-

ferent prices to a chain store or mail order organization and to competing independent retail establishments.

NATIONAL RECOVERY ADMINISTRATION

In a memorandum sent April 12th to all code authorities and State and Regional NRA Directors, the National Recovery Administration emphasized the distinction between mandatory and permissive cost formulas or cost systems. Only mandatory systems which are integral parts of codes when approved, or those specifically approved by NRA are subject to enforcement. There are two types of cost formulas or cost systems—those that are mandatory and used in connection with selling below cost provisions in codes and those that are permissive and used for educational purposes only to the extent found practicable.

The National Recovery Administration also announced new rules regarding contributions from industry to the costs of code administration designed to relieve small firms of an inequitable burden, lessen multiple assessments, simplify collections and permit the rate of contribution to be reduced at any time.

NARCOTIC TRAFFIC

Another successful raid has been made by Federal agents bringing to light further information regarding illegal sale of narcotics, a book was found giving the names and addresses of possible purchasers.

The Narcotic Division is also studying the addiction to marihuana. It is said to be used in cigarettes and in other forms with tobacco and the Department advises the enactment of state laws controlling the use.

SALES TAXES

The following states have provided legislation creating sales taxes: Missouri 1 1/2%, Maryland, Oklahoma, 1%, Arizona, Arkansas, Colorado, Idaho, Illinois, Indiana, Iowa, Michigan, Mississippi, North Dakota, South Dakota, Utah, Washington, West Virginia, Wyoming,

2%, California, 2½%, North Carolina, Kentucky, Ohio, 3%

A graduated sales tax is in existence in New Mexico and Vermont

Bills for sales taxes are still pending in Alabama, Connecticut, Georgia, Kansas, Maine, Massachusetts, Minnesota, Missouri, Montana, Nebraska, Nevada, New Jersey, North Carolina, North Dakota, Oklahoma, Rhode Island, South Dakota and Wyoming

RETAIL CODE AUTHORITY

The NIRB has approved an amendment to the code for the retail trade permitting incorporation of the code authority for the retail drug trade and of local committees for the trade. W S Elkin, Jr well known pharmacist, Atlanta, Ga has been appointed executive secretary of the National Retail Drug Code Authority. Together with Paul Pearson, assistant to the secretary, he will aid E F Kelly, secretary-treasurer of the code authority, in handling the work of the headquarters office

COMMISSIONS FOR PHARMACISTS IN U S ARMY

Congressman Jed Johnson Oklahoma, introduced H R 7485 on April 12th. This bill has been referred to the Committee on Military Affairs, hence, a reference only to the bill is made

Pharmacists under this bill must be graduates of a recognized college of pharmacy. Section 4 provides for promotion to grade of first lieutenant after three years of service, further advancements to captain, major, lieutenant colonel and colonel after respective consecutive services of 6, 12, 20 and 26 years

ARIZONA

Governor B B Moeur has signed a bill drafted by the Arizona Pharmaceutical Association and passed by the Arizona legislature creating a state board of pharmacy

After a debate, during which Representative Porter, woman member in the House declared that cosmetics were as much of a necessity for women as shaving cream was for men, cosmetics were stricken from the luxury tax list

COLORADO

House Bill 557, which makes the state laws conform to federal laws governing sales of hypnotic drugs, was passed by the senate

GEORGIA

The uniform narcotic bill, designed to eliminate sales of illicit drugs in Georgia, was passed

by the house. A sub-committee of the Senate Finance Committee is studying the chain store tax bill passed by the house

CALIFORNIA

A 10 per cent tax on proprietary medicines and cosmetics, with but few exceptions, is provided in a bill recently introduced into the California legislature

Under a bill, the California board of health would have the power to regulate the sale of any drugs that it may deem dangerous, injurious or poisonous

NEW JERSEY

The New Jersey Fair Trade Bill, patterned after the California Fair Trade Law, has been signed by Governor Harold G Hoffman. The final clause of the measure puts the law into effect immediately

MARYLAND

Maryland has passed House Bill No 70, amending the Narcotic Law to more nearly conform with the Federal Law and the proposed uniform state laws, No 219 authorizing the State Board of Health to adopt regulations to bring the standard of foods and drugs in Maryland up to that required under the Mapes Act, No 604 prohibiting medical shows and the distribution of sample drugs from door to door

H 145 has passed the house and the senate, proposing to prohibit the retail sale and distribution of barbitals and other hypnotic and somnifacient drugs except on the prescription of a licensed physician, dentist or veterinarian. The drugs mentioned are to include barbituric acid, sulphionethylmethane (trional), sulphomethane (sulphonol), diethylsulphon diethylmethane (tetronal), paraldehyde and chloral or chloral hydrate or chlorbutanol

OREGON

Oregon's Fair Trade Bill is framed to protect trade mark owners, distributors and the public against injurious and uneconomic practices in the distribution of articles of standard quality under a distinguished trade-mark, brand or name, placing certain limitations for resale upon commodities, and to repeal Chapter 311 Oregon Laws, 1933

WASHINGTON

Washington's Fair Trade Act relates to the sale of certain articles and commodities, providing protection for trade-mark owners, dis

tributors and the public against injurious and uneconomic practices in the distribution of articles and commodities of standard quality

under a distinguished trade mark, brand or name, prescribing penalties, and declaring that this act shall take effect immediately

BOOK NOTICES AND REVIEWS

Urinary Analysis and Diagnosis By LOUIS HEITZMANN M D With a chapter on the Determination of the Functional Efficiency of the Kidneys By Walter T Danreuther, M D, F A C S Professor of Gynecology and Director of Department, New York Post Graduate Medical School and Hospital, Columbia University Sixth edition Cloth Price \$5 00 Pp 385, with 131 illustrations Baltimore William Wood and Company, 1934

The text of this edition has been thoroughly revised and brought up to date by extensive changes and additions The work is presented in three parts Part I includes a discussion of the physical and chemical properties of urine the normally occurring organic and inorganic constituents of urine under normal and pathological conditions and the abnormal constituents including the proteins and carbohydrates Efficient methods of identification are given, and in some cases the more simple quantitative methods are described Considerable space is devoted to the identification of those normal constituents that might be confused with the abnormal Part II includes the general procedures for microscopic examination of urine, the identification of crystalline and amorphous urinary sediments of both organic and inorganic substances, pus, blood cells the various types of epithelial cells, mucus, cylindroids casts, animal parasites microorganisms of the hyphomycetes saccharomycetes and schizomycetes groups and extraneous matter which might be confusing such as foreign vegetable and animal fibres Part III is a continuation of the microscopic examination of urine with particular emphasis on the microscopic picture presented by various pathological conditions of the genito urinary tract and the interpretation of these findings There is a discussion of the tissue changes which occur under pathological condition and an effort is made to unravel the confusion in the nomenclature applied to the various types of kidney lesions Chapters on technique and interpretation of several methods of measuring kidney function and the hormone tests for pregnancy complete the book

In criticism it might be stated that it is unfortunate that the quantitative methods included have been limited to those simpler procedures which require little apparatus, but these omissions are offset by the detail and completeness of the material presented The sections devoted to microscopy are most comprehensive including many original plates which show both normal and pathological findings, and are evidences of the author's vast experience This book can be recommended as a complete reference for clinical urinary analysis, and should prove invaluable to technicians and to those physicians who do their own laboratory work It should also prove of value as a text in courses on urinalysis —JOHN C BAUER

The Romance of Exploration An interesting and well-illustrated book has been published by Burroughs Wellcome & Co, entitled, Romance of Exploration and Emergency First Aid from Stanley to Byrd It is largely an illustrated description of the display at the Century of Progress Exposition and presents the important achievements in discovery during the last two centuries together with illustrations depicting events of the explorations and means for first aid It impresses the importance of compact and reliable medical equipment and the close relationship of drugs to discoveries and progress of civilization

Dechema Monographs No 49-56 (6th volume), 8 lectures delivered at the conference of the Dechema, Deutsche Gesellschaft für chemisches Apparatewesen E V held at Wuerzburg in 1933 with 9 tables and 98 illustrations accompanying the text, Verlag Chemie G m b H Berlin 1934, published by the Dechema Deutsche Gesellschaft für chemisches Apparatewesen E V Price RM 5 —(for member RM 4 —)

In this volume, Professor W J Müller proposes a classification of chemical reactions according to the state of aggregation of the substances involved, which is important from an educational point of view, and interesting to the practical man in so far as he is able to grasp

the comparable points. Other interesting subjects are included.

We acknowledge with thanks the following reprints from The Wellcome Chemical Research Laboratory (The Wellcome Foundation, Ltd.) T. A. Henry, D. Sc., *Director*.

"The Irritant Constituent of Anti Leprotic Oils," by H. Paget, J. W. Trevan and A. M. P. Attwood.

'Modified Cinchona Alkaloids, Part I. Apoquinine and Apoquinidine,' by T. A. Henry and W. Solonion.

'The Alkaloids of Alstonia Barks Part I. A Constructa,' F. Muell, by T. M. Sharp.

'The Action of the Cinchona and Certain Other Alkaloids in Bird Malaria Part II,' by G. A. H. Buttle, T. A. Henry and J. W. Trevan.

We are in receipt of a reprint from the Department of Pharmaceutical Research of the Shanghai Science Institute on the Chemical Composition of *Daphne Genkwa* by Manso Nakao and Kwong Fong Tseng courtesy of the *Journal of the Shanghai Science Institute*.

We are in receipt of the following reprints from the F. E. Chidester: 'Diabetes and the Thyroid Glands', 'Biochemical Attacks on Insanity', 'Dehydrogenated and Unsaturated Substances in Relation to Cancer, Vitamins and Hormones', 'Endocrine Function, the Sympathetic Nervous System and Calcium'.

Dr. John C. Krantz, Jr., has favored us with the following reprints: 'Action of Trichloroethylene on Perfused Vessels of the Frog', 'A Note on the Assay of Reduced Iron', 'A Note on the Arsenic Test for Reduced Iron', 'Pharmacological and Chemical Studies of the Digitalis Group I. Adonis Apocynum and Convallaria', 'Influence of Cesium Ions on Oxygen Demand of Sewage'.

Receipt is acknowledged of Proceedings of the American Association of Colleges of Pharmacy for 1934.

We have received a reprint from the German Apotheke on *Healing and Spice Drugs* for information of their citizens. Also the following dissertation: "Über die Alkylierung und Acylierung der Hydroxylgruppen des Morphins sowie über eine neue Darstellung des

Diacetylmorphins. Inaugural Dissertation zur Erlangung der philosophischen Doktorwürde vorgelegt der Mathematisch - Naturwissenschaftlichen Abteilung der Philosophischen Fakultät der Universität Basel von Anton Baselgia, Apotheker aus Somvix (Graub.) (Dr. H. Zornig and Dr. H. Fischer).

AWARD IN BIOCHEMISTRY

The biochemist to receive the first of the Eli Lilly and Company award has been selected by unanimous vote of the committee. The committee which under the rules served with Edward Bartow, State University of Iowa, President Elect, as chairman consisted of H. T. Clarke, Columbia University, L. J. Henderson, Harvard University, W. R. Bloor, University of Rochester, H. B. Vickery, Connecticut Agricultural Experiment Station, P. A. Shaffer, Washington University, and D. D. Van Slyke, The Rockefeller Institute.

Dr. Willard Myron Allen, to whom the award is given, has done outstanding work in developing a sharply defined biological test for the action of the *Corpus luteum*, the use of this test is to isolate in crude form a potent extract and then the complete purification of the hormone now called 'progesterone'.

Satisfactory progress is being made in the subscriptions to the fund raised to perpetuate the memory of Prof. H. G. Greer. The memorial will take the form of a free place in the College of the British Pharmaceutical Society. The Council of the Society has agreed to provide the free place at the College and the grant meets other expenses.

Drs. A. C. Frizer and V. G. Walsh of St. Mary's Hospital Medical School, London report success in treatment of pneumonia with olive oil. The olive oil is emulsified and then injected into the veins. The treatment is being applied in other diseases.

CALIFORNIA MEDICAL SOCIETY ENDORSES SICKNESS INSURANCE

Following the session of the House of Delegates of the American Medical Association in Chicago in February, a meeting of the house of delegates of the California Medical Association was held in Los Angeles. A special committee of five, appointed by the house of delegates of the California Medical Association in 1934, submitted a report of a survey of health care in California and a plan for the administration of health insurance. This committee, with an ad

visory council, had made the survey, which involved a study of medical practice as conducted by physicians, dentists, osteopaths, hospitals and clinics, and a direct study of the health care of the public obtained through 48 000 questionnaires secured from families by field workers and by mail. The cost of the survey was approximately \$80,000.00 of which some \$25,000.00 was supplied by the California Medical Association and the remainder through an appropriation by the government—*Jour A M A* for April 6th

DIVISION OF MEDICINAL CHEMISTRY PROGRAM AT NEW YORK

The program of the division of medicinal chemistry prepared for April 25th is being composed entirely of invited addresses. These are as follows: George Merck—"Centenary of Chemical Industry"; W F von Oettingen—"The Development of Industrial Medicine with Special Reference to the Problems and Tasks of Industrial Toxicology"; Michael Heidelberger—"The Chemistry of Bacterial Proteins"; Vincent du Vigneaud—"Present Status of the Oral Administration of Insulin"; Drs Small, Mosettig and Eddy—"Latest Progress in the Search for Morphine Substitutes I. The Morphine Series II. The Phenanthrene and Dibenzofuran Series"; Wm P Murphy and Isabel Howard—"The Use of Intramuscular Liver Extract"; Movies

FEDERAL ALCOHOL CONTROL ADMINISTRATION

Section 4 of the Regulations Relating to Non-Industrial Use of Distilled Spirits and Wine (General Regulations, Series 4) is amended by adding thereto the following:

(d) Members of the distilled spirits industry and the distilled spirits rectifying industry, engaged in the sale or other disposition of distilled spirits other than alcohol, for industrial use as above defined in containers of a capacity in excess of one gallon shall ship or deliver such distilled spirits directly to the industrial user thereof, and shall not sell or otherwise dispose of such distilled spirits to any person who is not actually engaged in the use of distilled spirits for industrial purposes

SAFER INSECTICIDES FOR VEGETABLES DEVELOPED BY AGRICULTURE DEPARTMENT

Wider use of pyrethrum and derris seems to be the answer to the grower's need for keeping

his leafy vegetables free from residues of the more toxic insecticides, according to W H White, in charge of truck crop and garden insect investigations, U S Department of Agriculture. Chemists and entomologists of the department have long sought substances that could be depended on to protect growing crops against destructive insect pests and still leave nothing harmful to human beings on the product to be marketed. Scientists working on the problem have found that minute quantities of two plant products—derris and pyrethrum—kill many insects feeding on truck crops and are less likely than most inorganic insecticides now in common use to leave harmful residues. Insecticides made from derris and pyrethrum are now on sale in most seed and drug stores in the United States. Plant specialists of the department are investigating the possibilities of growing insecticidal plants in this country.

In 1916 Edward V Sheely was elected president of the Tennessee Pharmaceutical Association and in 1917 he was appointed a member of the State Board of Pharmacy, on which he served the allotted term of five years. When in 1927, he was prevailed upon by the political powers in command to accept the Memphis postmastership, he moved into the new environment and shouldered the new responsibilities with characteristic zest and confidence. He did not lose touch with pharmacy during this tenure of office.

George M Gales has resigned as member of the National Retail Drug Code Authority. The code authority will consider Mr Gales' action at its next meeting.

Carleton B Joeckel, library authority now on the faculty of the University of Michigan, has been appointed Professor of Library Science in the Graduate Library School of the University of Chicago. Dr Joeckel's appointment becomes effective October 1, 1935.

ALUMNI MEETING PITTSBURGH COLLEGE

The Alumni Meeting of the Pittsburgh College of Pharmacy will be held at Cedar Point, Sandusky, July 16th to 20th. E Bruce Dawson of Cleveland, has been elected to act as Secretary. Among the speakers will be Prof James H Beal, Dean C Leonard O'Connell and Dr George D Beal.

The Program Committee is preparing a Year Book to be presented to each member of the Alumni.

IDAHO PHARMACY LAW FAILS

Due to amendments designed to kill the pharmacy bill proposed by the Idaho Association the enactment of the measure failed

UTAH CHANGES PLACE FOR MEETING

Utah State Pharmaceutical Association will meet in Salt Lake City instead of Provo, the date of the meeting has not been fixed

NOTICE TO CONTRIBUTORS TO THE JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION

The following notice has been prepared from comments received from members of the Board of Review of Papers and of the Publication Committee

Manuscripts should be sent to Editor E. G. Eberle, 2215 Constitution Ave., N. W., Washington, D. C.

All manuscripts should be typewritten in double spacing on one side of paper 8 1/2 x 11 inches, and should be mailed in a flat package—not rolled. The original (not carbon) copy should be sent. The original drawings, not photographs of drawings, should accompany the manuscript. Authors should indicate on the manuscript the approximate position of text figures. All drawings should be marked with the author's name and address.

A condensed title running page headline, not to exceed thirty-five letters, should be given on a separate sheet and placed at the beginning of each article.

The method of stating the laboratory in which the work is done should be uniform and placed as a footnote at end of first page giving Department, School or College. The date when received for publication should be given.

Numerals are used for figures for all definite weights, measurements, percentages and degrees of temperature (for example 2 Kg, 1 inch, 20.5 cc, 300° C). Spell out all indefinite and approximate periods of time and other numerals which are used in a general manner (for example one hundred years ago, about two and one-half hours, seven times).

Standard abbreviations should be used whenever weights and measures are given in the metric system, e. g. 10 Kg, 2.25 cc, etc. The forms to be used are cc, Kg, mg, mm, L and M.

Figures should be numbered from 1 up, beginning with the text figures (line engravings are always treated as text figures and should be designed as such) and continuing through the plates. The reduction desired should be clearly indicated on the margin of the drawing. All drawings should be made with India ink, preferably on white tracing paper or cloth. If coordinate paper is used, a blue lined paper must be chosen. Usually it is desirable to ink in the large squares so that the curves can be more easily read. Lettering should be plain and large enough to reproduce well when the drawing is reduced to the width of a printed page (usually about 4 inches). Photographs intended for half-tone reproduction should be securely mounted with colorless paste.

"Figure" should be spelled out at the beginning of a sentence, elsewhere it is abbreviated to "Fig.," per cent—2 words.

The expense for a limited number of figures and plates will be borne by the JOURNAL, expense for cuts in excess of this number must be defrayed by the author.

References to the literature cited should be grouped at the end of the manuscript under the *References*. The citations should be numbered consecutively in the order of their appearance (their location in the text should be indicated by full sized figures included in parentheses). The sequence followed in the citations should be: Author's name (with initials), name of publication, volume number, page number and the date in parentheses. Abbreviations for journals should conform to the style of *Chemical Abstracts* published by the American Chemical Society.

(1) Author A. Y. *Am J Physiol* 79:289 (1927).

Papers presented at the Sections of the AMERICAN PHARMACEUTICAL ASSOCIATION'S annual meeting become the property of the Association and may at the discretion of the Editor be published in the JOURNAL. Papers presented at these Sections may be published in other periodicals only after the release of the papers by the Board of Review of Papers of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The Editor will appreciate comments from Board of Review and Committee on Publication members, authors and others interested.

PLANT SCIENCE SEMINAR

PORTLAND MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The 13th annual meeting of the Plant Science Seminar will be held at North Pacific College, Portland, Ore. Announcements regarding the tour have been sent out, much information is given in the April JOURNAL and further details may be obtained by addressing the Local Secretary, Dean A. O. Mickelsen, N. E. 6th Ave. at Oregon, Portland, Ore.

The local committee is planning a program of field trips, lectures and visits of interest in the vicinity of Portland. The Seminar will make a two-day trip to Corvallis, stopping at points of interest under the direction of Prof. E. T. Stuhr. The local flora of Willamette Valley will be studied and a visit made to the drug farms where Hydrastis, Ginseng and Peppermint are cultivated.

OREGON SCENERY

It is inherent in Americans to love the mountains, nature's wilds that endure down through the centuries. Oregon has its Coast Range, the Cascades, the Siskiyou, the Blue Mountains and other lesser groups. Here deep in the forests, in flower-covered meadows that nestle high above the world, alongside of lakes that dot the mountains like jewels inset in this wondrous panorama of nature, one may forget the troubles of the outside world. In fact, he can forget that any other world except this new one of peace and supreme contentment exists.

Crater Lake in Southern Oregon, a day's journey from Portland, is alone worth a trip across the continent, a miniature sea of sapphire, a jewel of wondrous blue set deep down in a rocky clasp of the Cascade mountains.

Go to the ends of the earth and nowhere will you find a body of water that matches it in magnificence and beauty. Neither is there any lake that matches it geologically.

Portland's parks, some with their natural lakes and virgin timber that has been preserved within their borders and beautified by wondrous rose gardens, other plants and shrubbery, are themselves worth a day of your time.

INFORMATION

For information relative to program, rates and routes address the local committee or E. N. Gathercoal, 701 So. Wood St., Chicago. H. C. Christensen, 130 No. Wells St., Chicago. C. B. Jordan, Purdue University, La Fayette, Ind. F. H. Eby, 1808 Spring Garden St., Philadelphia, Pa. F. J. Bacon, Western Reserve University, Cleveland, Ohio.

A. O. MICKELSEN

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIV

MAY, 1935

No 5

THE LOCAL SECRETARY OF THE PORTLAND MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

This brief sketch introduces the local secretary, A O Mickelsen, of the AMERICAN PHARMACEUTICAL ASSOCIATION for the meeting to be held in Portland, Ore , August 5th-10th

Prior to the World War, Mr Mickelsen specialized in commerce and public accounting, but due to an injury sustained during service, he concluded to engage in other activities and chose pharmacy, his training includes a college course in law He became associated with the School of Pharmacy, North Pacific College of Oregon, for six years he served as instructor, then advanced to professor and, later, was elected dean

It was largely through his efforts that a branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was organized in Portland When the American Medical Association held its meeting in Portland (1928) Dean Mickelsen was chairman of the U S P exhibit which was awarded the national certificate of merit for an outstanding educational display of the convention He has been active in radio talks and publicity in behalf of professional pharmacy and was local chairman of Pharmacy Week He has been associated with Kappa Psi for more than twelve years, for two years he served as satrap of the Northwestern Province and was instrumental in installing Pi Chapter of Rho Chi at the North Pacific College and is grand regent of Kappa Psi

Dean Mickelsen is deeply interested in advancing the professional relations of dentistry and pharmacy, he is vice-president of the American Association of Colleges of Pharmacy, state chairman of food and drug legislation, representing the former association, and president of the North Pacific branch, A PH A He was a member of the committee of five members who compiled the Pacific Drug Review prescription schedule

He is a member of Post No 1 of the American Legion, Portland, Ore

EDITORIAL

E G EBERLE, EDITOR

2215 Constitution Ave , WASHINGTON, D C

INTERNATIONAL CONGRESS OF MILITARY MEDICINE AND PHARMACY

IN former years no funds were available for delegates to the International Congress of Military Medicine and Pharmacy. Funds are to be provided this year by the adoption of a resolution submitted by the Committee on Foreign Affairs, providing for an appropriation of \$8000.00 or so much thereof as may be necessary for expenses of participation by the United States in the 8th International Congress of Military Medicine and Pharmacy to convene at Brussels in June 1935.

Comment on prior meetings was made in the April JOURNAL. Secretary Cordell Hull believes that no less than 10 delegates should be sent from the United States and, certainly, pharmacy should be represented.

The Congress of Pharmacy convenes in Brussels on July 30th, and a very interesting program has been prepared, which was published in the *Journal de Pharmacie de Belgique*. There is more or less of a relationship between the two organizations and presents the opportunity for representation at both conventions. A wide range of papers has been listed for the Congress of Pharmacy, some of which may find application in the International Congress of Military Medicine and Pharmacy, thus, a paper by A. J. J. Van der Velde on "Research on the Sterilization and Biochemical Control of Pharmaceutical Products," "The Toxicity of Certain Insecticides," ably presented by Dr. Hampshire and Professor Schoofs, and quite a number of subjects were discussed by pharmacists at earlier Congresses, among the latter, the preparation of tablets, ampuls, methods of sterilization were shown, and a motor pharmacy demonstrated. European pharmacy was heretofore represented, but the writer's records do not show participation by American pharmacists.

THE PHARMACIST IN LITERATURE AND THE MUSEUM OF THE AMERICAN INSTITUTE OF PHARMACY

THE *Bulletin de la Société d'Histoire de la Pharmacie* (France) for March presents a statement from the pharmacy of J. B. Caventou for "La Dame aux Camélias" from the collection of P. Lemay. The bill-head carries the inscription and face of the medal of award by the Royal Institute of France of the grand prize for the discovery of quinine sulphate by Pelletier and Caventou. There is further interest attached because only two of the novels of Dumas, the younger, survived, one of these "La Dame aux Camélias," from which book came the immortal drama by the same title.

In the Sunday *Times Herald* (Dallas, Tex.), April 21st, William D. Hornaday writes of an unfinished O. Henry story in a counter blotter of the drug store of J. J. Tobin, Austin, Texas, recently discovered. The story bears no title and is written in long hand by the author and reproduced in the *Times Herald*, but not reproduced in the JOURNAL at this time, because no reference is made of drugs. In Austin there abounds a wealth of O. Henryana, one of our fellow-members, the late H. L. Carleton, was manager of the Tobin drug store for a time, he informed the writer that years passed and O. Henry had left Texas before he knew William

Sydney Porter and O Henry was the same person. It may be of interest to note that this master of the American short story selected as his *nom de plume* a name from the U S Dispensatory under Diluted Hydrocyanic Acid, that of O Henry, referred to in connection with a proposed test, perhaps Porter was looking up data on poisons to be used in his writings.

Through a grant from the Carnegie Corporation and with the cooperation of the School Art League, the Folk Arts Museum at Riverdale is open to the public, Mrs Eli Nadelman is the director. Walter Rendell Storey contributed an illustrated article to the *New York Times Magazine* for April 28th on the museum, in which are ensembles of furnishings, including an early American Pharmacy, with shelves, counters, bottles, jars, some still full of old herbs and drugs. Other types of displays are described.

These comments are made to enlist the interest of possible contributors to the museum of the American Institute of Pharmacy, where the history of American pharmacy should be arranged and displayed.

FEDERAL DRUG LEGISLATION MUST NOT BE PERMITTED TO DIE

BY ROBERT P FISCHELIS *

AS usually happens about this time of the year in matters of controversial Federal legislation, the situation with reference to Food and Drug legislation has reached a point where proponents, opponents and those who favor revision in part, must either effect compromises on disputed points or demonstrate that one or another group has marshaled sufficient support to be able to win when the matter comes to a vote in the Senate and House of Representatives. The only other alternative is to allow this proposed legislation to die and perhaps revive it at a later session of the Congress.

It appears to impartial observers that neither the proponents of the present Copeland bill nor its opponents nor those favoring partial revision can get all they want. Certain amendments introduced by Senator Bailey of North Carolina and others proposed by Senator Clark of Missouri have met opposition by Senator Copeland. It is somewhat difficult to decide on what basis and in whose behalf some of the proposed amendments have been offered because there has been much "under cover" activity in connection with this legislation.

All of this must seem rather confusing to consumers of foods and drugs and to those producers and distributors who have no particular axe to grind and who can meet practically any standard which the Government might set with respect to quality, labeling, advertising or distribution of their product.

It is difficult to understand why minority groups, whose chief interest in food and drug legislation is to block efforts to compel truthful labeling and advertising of foods and drugs and to ease the path of fakers in the food and drug industries, should be in a position to thwart the efforts of earnest legislators and respectable citizens in providing proper control of the manufacture and distribution of drug products.

* President AMERICAN PHARMACEUTICAL ASSOCIATION

The answer is to be found in the peculiar partnerships which spring up between respectable members of industries and their predatory competitors when they either believe or are stampeded into believing that they are menaced by a common enemy. For example, one can hardly conceive of certain manufacturers of prescription products lining up with patent medicine manufacturers against the Government in matters of drug legislation when it is remembered how strongly the first-named group endeavors to emphasize to the medical and pharmaceutical professions and to the public its highly ethical conception of the function of drug manufacturers in the field of medical care. Again, it is difficult to understand why patent medicine manufacturers, after proclaiming the establishment of a self-imposed censorship of their advertising and engaging supposedly competent medical and technical advisers to keep themselves out of trouble, should oppose legislative confirmation of this admittedly necessary activity which would extend its benefits to all members of the industry and to all consumers of drugs and medicines.

What is there in the record of Food and Drug law enforcement by the Federal Government for the past thirty years that justifies any lack of confidence or the withholding of sufficient power to protect the public against the vicious and unethical practices which the proposed food and drug law prohibits?

American pharmacy and the drug industry simply cannot afford to allow the proposed legislation to die. The onus of failure to pass adequate legislation at this session must not be laid at our doorstep. It is not only fair play for the public and fair play for honest manufacturers and distributors of drugs and medicines but also extremely expedient for the drug industry to advocate "action and action now" on the bill without interposing further impossible conditions of compromise. Let it not be said that American consumers of foods and drugs have been deprived of proper protection against charlatans and betrayers of the confidence of the readers of our popular magazines and listeners to radio-broadcasts because the drug industry of the United States gave aid and comfort to its moral outlaws by objecting to regulations which are in the public interest.

THIRD NOTICE FROM THE COMMITTEE ON TRANSPORTATION

T. J. BRADLEY, CHAIRMAN

Several tours to Alaska will be available at the close of the Portland meeting of the ASSOCIATION. These include 9-day tours from Seattle to Skagway at eighty-five dollars for fare, meals and berth, and there will be no additional railroad fare to Seattle for those who are returning by way of that city, and several more extensive tours are available at proportional rates. Inquiries about these tours should be addressed to Local Secretary A. O. Mickelsen, N. E. 6th Ave., at Oregon, Portland, Oregon.

Several suggested routes, to and from Portland, were given in the April number of the JOURNAL, and the rates for the round trip, going by way of these or other routes and returning by another route are very low. It is not likely that we shall ever have a more favorable opportunity to visit the far west, and it should not be missed. Certificates will not be needed this year, to secure the low excursion rates, and any tourist agents will be able to give the members exact rates from their home cities, with other particulars.

ALKALOIDAL REAGENTS VII THE DETECTION OF THALLIUM *

BY JAMES C MUNCH¹ AND JUSTUS C WARD

In connection with our studies on thallium the need arose for rapid, sensitive, specific methods of qualitative detection and of quantitative determination, in tissues, plants, soils and various types of products

Thallium forms two series of compounds, being monovalent and trivalent In general the trivalent or thallic compounds are unstable, being reduced to the thalious products Commercial material used for cosmetics, medicinal and rodenticidal purposes is almost entirely thalious thallium

In the flame, thallium compounds dissociate, liberating Tl which produces a characteristic green color and spectrum If this flame is allowed to strike on a cold surface, a brown mirror of Tl forms (73) In the Marsh apparatus the stain produced is similar to that produced by arsenic, but it gives a characteristic yellow color with iodine and is insoluble in ammonium sulphide (11) Spectroscopic studies of the emission spectra (67) show a number of characteristic lines, between 2552.9 Å and 7117.0 Å In the visible spectrum the line usually considered to be characteristic is at 5350.47 Å Using the spectroscope, a number of qualitative investigations have been conducted (16, 25, 41, 43, 45, 51, 57, 72, 79, 82, 84, 99) The limit of sensitivity is reported to be 1 gamma, although Lamy claimed that he was able to detect 0.002 gamma of thallium by following the 5350 line We have used the spectroscope in our investigations, but have also made a detailed search of the literature and a specific study of the more promising reactions with the view of developing quick methods to use when a spectroscope is not available Our detailed results are given in Tables I and II

It must be remembered that working conditions in various laboratories may influence the delicacy of response of these qualitative tests. We have suggested the approximate sensitivity of some of these reactions, solely as suggestion of their routine application, rather than as absolute limits for threshold reactions.

In making these tests, thallic sulphate and various thallous compounds were used (usually thallous sulphate). Since the atomic weight of thallium is 204.1 a normal solution would contain about twenty per cent of Tl. Our stock solutions were prepared as *N*/10 and *N*/1000 solutions with respect to Tl. When these solutions have given positive results, further dilutions have been prepared to determine the approximate threshold of sensitivity.

CONCLUSION

Qualitative tests for thallium have been studied, using ninety reagents

LOCAL ANESTHETICS—PHENYL PROCAINE *

BY W BRAKER AND W G CHRISTIANSEN ¹

This investigation concerns the study of phenyl derivatives of procaine (I) and its analogues. The study was initiated by the comparatively greater activity and lesser toxicity of *o*-phenyl phenol over phenol. The substitution of a phenyl group on the benzene nucleus of procaine would yield, it was expected, a substance of greater potency and lesser toxicity than the parent substance. A summary of the biological activity of the various substances prepared is contained below.

The initial substance synthesized was phenyl procaine (II). The details of the preparation of (II) are stated in the experimental section. Essentially, the

synthesis employed was the preparation of 2-carboxy 5-amino diphenyl and the subsequent reaction of its sodium salt with β -diethylamino ethyl chloride. Phenyl procaine is an active anesthetic but due to such factors as precipitation upon the addi-

* Section on Practical Pharmacy and Dispensing, Madison meeting 1933

¹ Research Department of the Chemical and Pharmaceutical Laboratories, E R Squibb and Sons Brooklyn N Y

tion of buffers and irritation in corneal and intradermal tests, the compound does not appear to be of value

Analogues of phenyl procaine were synthesized for the purpose of

- (1) Determining the effect of increasing the size of the dialkylamino alkyl group (III)
- (2) Ascertaining the effect of alkylating the amino group (IV)
- (3) Investigating the effect of halogenation, as depicted by (V)
- (4) Observing the effect of the elimination of the amino group (VI)

The hydrochlorides of the above compounds were either too acid for testing (IV and VI) or too inactive (III and V) to warrant any further investigation

A compound containing a β -diethylamino ethyl carbamido group (VII) which is present in procaine was also prepared but was comparatively inactive

The effect of shifting the amino group from the 5- to the 4'-position was also studied. However, an aqueous solution of the hydrochloride of this substance (VIII) was comparatively inactive

EXPERIMENTAL

2-p Toluenesulphonamidodiphenyl (1)—Prepared from 2 amino diphenyl and *p* toluene sulphon chloride M p, 96° C

5 Nitro 2 p Toluenesulphonamidodiphenyl (2)—Prepared by nitration of 2 *p* toluenesulphonamido diphenyl M p 168–169° C

2 Amino 5-Nitro Diphenyl (3)—Prepared by hydrolysis of 2 *p* toluenesulphonamido 5-nitro diphenyl with concentrated sulphuric acid M p 123–125° C

2-Cyano 5 Nitro Diphenyl—The best procedure for the preparation of the substance requires diazotization of 2 amino 5 nitro diphenyl in concentrated hydrochloric acid. Diazotization in dilute hydrochloric acid and subsequent substitution of the diazonium group leads to a reduced yield

Fifty Gm of 2 amino 5 nitro diphenyl was suspended in 130 cc of concentrated hydrochloric acid and was diazotized with 21.5 Gm of sodium nitrite contained in 70 cc of water. The diazonium solution is then added at -10° to 0° C to a solution of potassium copper cyanide which had been prepared by adding 120 Gm of potassium cyanide in 250 cc of water to 100 Gm of crystalline copper sulphate contained in 250 cc of water. The addition of the diazonium solution was made over a period of 30 minutes using stirring. The suspension thus obtained was stirred at 0° C for one hour when the temperature was slowly raised to 20° C and held at the latter temperature for $1\frac{1}{2}$ hour. The suspension was then slowly heated to 90° C and kept at this temperature for 3 hours. The reaction mixture was carefully alkalinized with 150 cc of 40% sodium hydroxide. A brown precipitate was obtained which was filtered off, washed with water and dried *in vacuo*. The substance was twice recrystallized from alcohol.

Yield, 43 Gm of small needle like brown crystals —80%

Melting point, $131-133^{\circ}$ C

Assay—Nitrogen found, 11.90%

Calculated for $C_{13}H_9O_2N$, 12.50%

2-Carboxy 5 Nitro Diphenyl—This substance was obtained by hydrolysis of 2-cyano 5 nitro diphenyl.

Five and two tenths Gm of the cyano compound was suspended in a mixture of 75 cc of glacial acetic acid, 60 cc of sulphuric acid and 50 cc of water and refluxed for 8 hours. The mixture was then cooled and diluted with an equal volume of water. The white crystals obtained were filtered, washed with water and dried *in vacuo*.

Yield, 3.5 Gm, 62%

Assay—Nitrogen found, 5.78%

Calculated for $C_{13}H_9O_4N$, 5.76%

2 Carboxy 5 Amino Diphenyl Hydrochloride—Three Gm of 2-carboxy 5 nitro diphenyl was reduced with 10 Gm of tin and 50 cc of hydrochloric acid. The reduction was carried on for 3 hours, the solution was then diluted with water and the tin precipitated with hydrogen sulphide. The sulphide was filtered off and the filtrate was concentrated. When cooled the solution deposited 2 carboxy 5 amino diphenyl hydrochloride as silvery plates.

Yield, 1.3 Gm

Melting point, 230° C

Analysis—Nitrogen found, 5.42%

Calculated for $C_{13}H_{12}O_2NCl$, 5.61%

2-β Diethylamino Carboxy 5-Amino Diphenyl—One and two tenths Gm of 2-carboxy 5 amino diphenyl hydrochloride was dissolved in 20 cc of absolute alcohol and a solution of 0.22 Gm of sodium in 20 cc of alcohol was added. The sodium chloride which precipitated was removed by filtration and 1.0 Gm of β diethylamino ethyl chloride in 10 cc of alcohol was added to the filtrate, this alcoholic solution was refluxed for 7 hours. The solvent was then removed by distillation *in vacuo*. The residue was a light yellow oil which was converted to its dihydrochloride by passing dry hydrochloric acid gas into its ethereal solution. A yellow oil separated which, after pouring off the ether, was heated in an oven at 100° C for 2 hours. It was then placed in a vacuum desiccator over calcium chloride and sodium hydroxide. The dihydrochloride thus obtained was a yellowish white substance which was hygroscopic.

Analysis—Nitrogen found 7.29%

Calculated for $C_{19}H_{20}N_2O_2Cl$, 7.27%

Chlorine found 18.34%

Calculated for $C_{19}H_{20}N_2O_2Cl$, 18.44%

The borate of the base was obtained by evaporating to dryness an aqueous solution of 1.6 Gm boric acid and 1.1 Gm of base. A yellowish white powder was obtained.

Analysis—Nitrogen found, 4.87%

Calculated for $C_{19}H_{20}O_{17}B_2N_2$, 4.51%

2 Di *n*-Butylamino Carbopropoxy 5 Amino Diphenyl—One and one tenth Gm of 2-carboxy 5 amino diphenyl hydrochloride was dissolved in 20 cc of absolute alcohol and a solution of 0.2 Gm of sodium in 20 cc of alcohol was added. The sodium chloride formed was filtered off. The filtrate was added to a solution of 0.92 Gm of di *n* butylamino propyl chloride in 30 cc of alcohol. The solution was refluxed for 7 hours after which the sodium chloride formed was filtered off and the filtrate was distilled *in vacuo* to remove the solvent. The residue was a dark brown oil which was 2 di *n* butylamino carbopropoxy 5 amino diphenyl.

Analysis—Nitrogen found, 6.97%
Calculated for $C_{21}H_{31}O_2N$, 7.33%

The dihydrochloride was obtained by evaporating an alcoholic hydrochloric acid solution of the base *in vacuo*. It was a dark brown, brittle substance.

Analysis—Chlorine found, 15.94%
Calculated for $C_{21}H_{31}O_2N_2Cl_2$, 15.71%

2-Phenyl 4 Amino Benzoyl Chloride—Two and seven tenths Gm of 2-carboxy 5 amino diphenyl was dissolved in 30 cc of benzene and 5.0 Gm of thionyl chloride was added. The solution was refluxed for 3 hours after which the benzene and excess thionyl chloride were removed by distillation *in vacuo*, leaving an oily residue. The latter was distilled at 2–3 mm at which pressure 2 phenyl 4 amino benzoyl chloride distilled at 175–183° C. It was a yellow oil.

Yield, 2.5 Gm
Analysis—Chlorine found 15.49%
Calculated for $C_{13}H_{10}ONCl$, 15.33%

2 β Diethylamino Ethyl Carbamido 5-Amino Diphenyl Hydrochloride—Three and four-tenths Gm of 2 phenyl 4-amino benzoyl chloride was dissolved in 30 cc of dry benzene and reacted with 2.0 Gm (20% excess) of unsymmetrical diethylethylene diamine contained in 25 cc of benzene. The reaction mixture warmed up rapidly, it was refluxed for 3 hours. A solid separated out during refluxing. The isolation was made by pouring off the benzene from this solid and dissolving the latter in dilute hydrochloric acid. The acid solution was decolorized with charcoal and was evaporated to dryness *in vacuo*. The product was an extremely hygroscopic dark brown solid.

Analysis—Nitrogen found, 12.45%
Calculated for $C_{19}H_{16}N_2OCl$, 12.09%
Chlorine found, 10.84%
Calculated for $C_{19}H_{16}N_2OCl$, 10.23%

A borate was also prepared, it also was hygroscopic and was not further investigated.

2-Carboxy 5 Butylamino Diphenyl—Two and two-tenths Gm of 2 carboxy 5-amino diphenyl was dissolved in 10 cc of toluene and refluxed with 1.5 Gm of *n* butyl bromide. After 6 hours the toluene and excess butyl bromide were removed by distillation *in vacuo*. An alcoholic solution of the residual semi solid substance was decolorized with charcoal and evaporated to dryness. The residue was a brown semi solid.

Analysis—Nitrogen found 4.96%
Calculated for $C_{17}H_{19}O_2N$, 5.20%

2- β -Diethylamino Carbethoxy 5-Butylamino Diphenyl—2.35 Gm of 2 carboxy 5 butylamino diphenyl was dissolved in 25 cc of absolute alcohol and a solution of 0.22 Gm of sodium in 12 cc of alcohol was added followed by 2 Gm of β diethylamino ethyl chloride in 10 cc of alcohol. The solution was refluxed for 7 hours and then filtered from sodium chloride. The filtrate was decolorized with charcoal and 1 mol of hydrochloric acid was added. By evaporating the solution to dryness *in vacuo* the mono hydrochloride was obtained as a dark brown brittle substance.

Analysis—Nitrogen found, 6.56%
 Calculated for $C_{21}H_{13}N O_2Cl$, 6.92%
 Chlorine found, 8.90%
 Calculated for $C_{21}H_{13}N_2O_2Cl$, 8.78%

2-Carboxy 4 Chlor 5 Amino Diphenyl Hydrochloride—Two and two tenths Gm of 2 carboxy 5 amino diphenyl hydrochloride was dissolved in 25 cc of glacial acetic acid and then 1.8 Gm of sulphuryl chloride was added. The solution was allowed to remain at 25° C for 2 hours after which the acetic acid was removed by distilling *in vacuo*. The last traces of acetic acid were removed by heating with alcohol and subsequently distilling. The residue was a light brown solid.

Analysis—Chlorine found 25.39%
 Calculated for $C_{11}H_{10}O Cl N$, 25.08%

A portion of this substance was oxidized with alkaline permanganate solution. A small quantity of benzoic acid was isolated and identified by melting point. This indicated that the position of the chlorine atom was in the substituted benzene nucleus.

2 β Diethylamino Carbethoxy 1 Chlor 5 Amino Diphenyl Dihydrochloride—One and three tenths Gm of the sodium salt of 2 carboxy 4 chlor 5 amino diphenyl was refluxed with 1.2 Gm of β diethylamino ethyl chloride in alcohol for 5 hours. The isolation was made as in the preparation of 2 β diethylamino carbethoxy 5 amino diphenyl. A light yellow oil was obtained which was converted to its dihydrochloride by evaporating its alcoholic-hydrochloric acid solution to dryness *in vacuo*. A brown hygroscopic substance was obtained.

Analysis—Nitrogen found 7.08%
 Calculated for $C_{19}H_{13}N O Cl_2$, 6.67%
 Chlorine found, 16.22%
 Hydrochloride chlorine calculated for $C_{19}H_{13}N O Cl_2$, 16.92%

2 Cyano 4' Nitro Diphenyl—The substance was prepared by the same procedure used for 2 cyano 5 nitro diphenyl. A dark brown substance was obtained in a 30% yield.

Analysis—Nitrogen found 11.93%
 Calculated for $C_{13}H_8N O$, 12.50%

2 Carboxy 4'-Nitro Diphenyl—This substance was prepared by the hydrolysis of 2-cyano 4'-nitro diphenyl by the same procedure used for hydrolyzing 2 cyano 5 nitro diphenyl. A dark brown substance was isolated in a 54% yield.

Analysis—Nitrogen found 5.93%
 Calculated for $C_{13}H_8O_2N$, 5.76%

2-Carboxy 4'-Amino Diphenyl Hydrochloride—This was prepared by reduction of 2 carboxy 4' nitro diphenyl by tin and hydrochloric acid. A dark brown, feathery substance was obtained.

Analysis—Nitrogen found 5.38%
 Calculated for $C_{13}H_{11} O NCl$, 5.61%

2 β Diethylamino Carbethoxy 4'-Amino Diphenyl Dihydrochloride—The method employed was identical with that used in the preparation of 2 β diethylamino carbethoxy 5 amino diphenyl dihydrochloride. A dark brown semi solid substance was obtained.

Analysis—Nitrogen found, 7.70%
 Calculated for $C_{19}H_{16}O N_2Cl_2$, 7.27%
 Chlorine found, 18.48%
 Calculated for $C_{19}H_{16}O_2N_2Cl$, 18.44%

4 Cyano Diphenyl (4)—The substance was prepared according to Kaiser's method (5) M p 79° C

4 Carboxy Diphenyl (6) —The hydrolysis of 4 cyano diphenyl yielded the substance
M p 220° C

4 β Diethylamino Carboethoxy Diphenyl Hydrochloride —This substance was obtained by refluxing sodium *p* phenyl benzoate with diethylamino ethyl chloride and subsequently covering the base to its hydrochloride by methods mentioned above

Analysis—Chlorine found, 10.29%

Calculated for $C_{19}H_{21}O_2NCl$, 10.64%

Anesthetics Tests —The biological results have indicated that phenyl procaine is considerably more active than cocaine hydrochloride and novocaine. This fact is borne out by the following table denoting the concentrations required for equivalent duration of anesthesia by intradermal injection into guinea pigs

TABLE I

Duration of Anesthesia	Required Concentration of the Dihydrochloride Phenyl Procaine	Cocaine	Procaine
50 Minutes	0.73%	1.01%	2.1%
35 Minutes	0.40%	0.52%	1.0%

Phenyl procaine hydrochloride was also more active on the rabbit's cornea although it was slightly irritating

The biological tests on compounds reported herein were made in the Biological Research Laboratories of E. R. Squibb and Sons and we gratefully acknowledge their assistance

SUMMARY

In a series of phenyl derivatives of procaine the most active is the hydrochloride of β -diethylamino ethyl 2-phenyl 4-amino benzoate

ACYL DERIVATIVES OF ORTHO-AMINOPHENOL *

BY C. B. POLLARD AND W. T. FORSEE, JR

When diacyl derivatives of *o*-aminophenol were prepared by the usual methods, it was found in many cases that the order of introduction of the two different acyl groups has no influence upon the formation of the diacyl, identical products being isolated from the two acylations. The formation of identical rather than isomeric products on reversing the order of acylation indicated that during acylation a rearrangement must have occurred in one of the two cases. The positions of the acyl groups of the molecule were determined by removing the group attached to the oxygen by saponification with dilute alkali, and determining from the physical constants of the remaining monoacylated product the group attached to the nitrogen. The formation of isomeric diacyls and the production of the same

* Contribution from the Chemical Laboratories, College of Pharmacy, University of Florida

saponification product indicates that a rearrangement must have occurred during saponification

Considerable experimental evidence has indicated that certain acyl groups have more influence than others in bringing about this migration, weight and the acidity of the groups being considered to have the predominating influence in their obtaining a position in the more basic amino group

Previous work on this subject by Ransom (1), Ransom and Nelson (2), Nelson and others (3, 4, 5, 6, 7), Raiford and others (8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18) and Bell (19, 20) is discussed in the literature

The work of Pollard and others (21, 22) using one particular acyl chloride as one of the acylating agents in each diacyl throughout each series of experiments, indicated that relative acidity and weight of the acyl groups are not the controlling factors in this type of rearrangement

This investigation was carried out in order to study further the effect of these factors on rearrangement The acylating agent, *o*-*n*-heptanoyl chloride, was kept constant throughout the series This selection afforded a heavy group and one which was less acidic than any group against which it was introduced Diacyls were prepared by introducing the heptanoyl group against the *n*-butyryl, *n*-valeryl, *n*-caproyl, phenylacetyl and hydrocinnamyl groups

Regardless of the order of introduction, the *n*-heptanoyl and *n*-valeryl groups produced diacyls whose melting points and mixed melting points indicated that one or both of the compounds was a mixture of the two possible isomers Saponification of each of these diacyls yielded only *o*-*n*-heptanoylaminophenol, indicating in one case the migration of the *n*-heptanoyl group from the oxygen to the nitrogen Similar results were obtained with diacyls in which the acylating groups were *n*-heptanoyl and *n*-caproyl The acylation and saponification of these isomers involved rearrangements in which the *n*-heptanoyl group replaced the lighter and more acidic *n*-valeryl and *n*-caproyl groups

o-*n*-Heptanoylaminophenol acylated with *n*-butyryl chloride gave a compound which was distinctly different from that obtained by the acylation of *o*-*n*-butyrylaminophenol with *n*-heptanoyl chloride However, both isomeric diacyls yielded the same saponification product, *o*-*n*-heptanoylaminophenol Similar results were obtained with diacyls in which the acylating groups were *n*-heptanoyl and phenylacetyl The saponification of these isomers involved rearrangements in which the *n*-heptanoyl group replaced the lighter and more acidic *n*-butyryl group and the heavier and more acidic phenylacetyl group

Introduction of the *n*-heptanoyl and hydrocinnamyl groups resulted in the production of the equilibrium mixtures of the two possible diacyls regardless of the order of introduction Saponification in each case, also gave mixtures composed of approximately 50% of each of the possible monoacyls, showing that a partial rearrangement had occurred in each case

EXPERIMENTAL

o-*n*-Heptanoylaminophenol and *o*-*n*-caproylaminophenol were prepared by the method of Groenink (23) using *o*-aminophenol and the acid chloride in an anhydrous ether solution Their properties are summarized in Table I The other monoacyls used which have been previously described, were made by the same method

TABLE I—PROPERTIES OF MONOACYLS

	1	2
Name	<i>o n</i> -Heptanoylaminophenol	<i>o n</i> Caproylaminophenol
Formula	$C_6H_{13}CONHC_6H_4OH$	$C_6H_{11}CONHC_6H_4OH$
M p, ° C	85 5-86 5	80 0-80 5
Yield, %	96 00	95 00
N, % calculated	6 33	6 76
N, % found	6 18	6 76
C, % calculated	70 56	69 51
C, % found	70 64	69 46

o n Heptanoylaminophenyl *n* valerate ($C_6H_{13}CONHC_6H_4OCOC_4H_9$)—To 5 Gm of *o n*-heptanoylaminophenol was added 2 7 Gm of *n* valeryl chloride After the addition of 2 drops of concentrated sulphuric acid the mixture was heated on a water-bath for 5 hours A yellow oil was formed The product was washed thoroughly with hot water and, after repeated recrystallization from hot 80% alcohol and cooling in an ice salt bath, it solidified in white crystals melting at 37 5-38 5°

About 0 5 Gm of this compound was saponified with a small quantity of a 10% potassium hydroxide solution After complete solution had taken place, the mixture was filtered, cooled and acidified with dilute hydrochloric acid White crystals separated This product was filtered, washed with water and recrystallized from dilute alcohol A mixed melting point of this product with *o n*-heptanoylaminophenol showed the two compounds to be identical

Compounds listed in Table II as 2, 3, 4, 7 and 8 were prepared by this method which is a modification of that of Jacobs, Heidelberger and Rolf (24)

o n-Heptanoylaminophenyl *n* butyrate ($C_6H_{13}CONHC_6H_4OCOC_3H_7$)—A mixture of 5 Gm of *o n* heptanoylaminophenol, 2 5 Gm of *n*-butyryl chloride and 2 drops of concentrated sulphuric acid was placed in an anhydrous ether solution and refluxed on a water bath for 2 hours After evaporation of the ether, a pale yellow oil remained This was thoroughly washed with hot water and, after cooling in an ice bath, the product solidified It was recrystallized four times from hot 80% alcohol, being deposited in white crystals, m p 41 5-42 5°

The compound listed in Table II as 6 was also prepared by this method All diacyls were saponified in approximately the same manner as previously described

o n Heptanoylaminophenyl hydrocinnamate ($C_6H_{13}CONHC_6H_4OCOCH_2CH_2C_6H_5$)—An excess (6 Gm) of hydrocinnamyl chloride was added to a pyridine solution of 6 6 Gm of *o n*-heptanoylaminophenol The mixture was refluxed on a water bath for 4 hours After allowing to stand over night, the mixture was diluted with several volumes of water A red oil separated This was filtered and washed thoroughly with a very dilute hydrochloric acid solution The remaining oil was then washed with a 5% solution of ammonium carbonate After thoroughly washing with hot water, the oily product was dissolved in a minimum quantity of hot 80% alcohol and allowed to crystallize in an ice salt bath Red-brown crystals separated After several such recrystallizations, a cream-colored product was deposited which melted at 47-50° C

The compound listed in Table II as 10 was also prepared by this method which is that of Einhorn and Hollandt (25)

TABLE II—DIACYL DERIVATIVES OF *o*-AMINOPHENOL

Saponification Product

1	$C_6H_{13}CONHC_6H_4OH$	7	$C_6H_{13}CONHC_6H_4OH$
2	$C_6H_{13}CONHC_6H_4OH$	8	$C_6H_{13}CONHC_6H_4OH$
3	$C_6H_{13}CONHC_6H_4OH$	9	50% $C_6H_{13}CONHC_6H_4OH$
4	$C_6H_{13}CONHC_6H_4OH$		50% $C_6H_5CH_2CH CONHC_6H_4OH$
5	$C_6H_{13}CONHC_6H_4OH$	10	50% $C_6H_{13}CONHC_6H_4OH$
6	$C_6H_{13}CONHC_6H_4OH$		50% $C_6H_5CH_2CH CONHC_6H_4OH$

The melting points in the cases of three pairs of isomers listed in Table II as 1, 2, 3, 4, 9 and 10 might indicate that in each case they were identical substances in an impure state, but analysis and mixed melting points seem to indicate that each might be an equilibrium mixture of the two possible isomeric diacyls

Mixed melting point of 1 and 2	38-40°
Mixed melting point of 3 and 4	37-39°
Mixed melting point of 9 and 10	50-54°

All the diacyls prepared are insoluble in water, soluble in alcohol and very soluble in ether

SUMMARY

A study of the diaeryl derivatives of *o* aminophenol, when one of the acyl groups was always the *n*-heptanoyl radical, has been made. The *n*-heptanoyl group was checked against the *n*-butyryl, *n*-valeryl, *n*-caproyl, phenylacetyl and hydrocinnamyl groups.

Apparently relative weight and acidity are not the controlling factors in this type of rearrangement. When complete rearrangement did occur, the nitrogen atom was shown after saponification to be attached to the heavier and less acidic group in three cases and to the lighter and less acidic group in one case. One case showed only partial rearrangement. In this case saponification products showed part of the nitrogen to be attached to the heavier and more acidic group while the remainder of the nitrogen was attached to the lighter and less acidic group.

Two monoacyls and ten diaeryl derivatives of *o*-aminophenol have been prepared, isolated and studied.

Some of these compounds are being studied for antiseptic and physiological effects. The results of this investigation will be published at a later date.

THE POTENCY OF OREGON DIGITALIS * 1

(A PRELIMINARY INVESTIGATION)

BY DONALD KUO-CHIH LEE AND ERNST T. STUHR ²

INTRODUCTION

The literature reveals considerable conflicting evidence relative to physiological activity of cultivated and wild growing foxglove (1, 2, 3, 4, 5, 6, 7, 8, 9) and age of the foliage (10, 11). These contradictions prompted the investigation of the native growing Oregon plants.

Foxglove grows wild throughout the Pacific slope region from Vancouver Island to California. In Oregon it is abundant along the western part of the state, but more especially in Lincoln and Coos counties.

The results here presented are from a seasonal study of wild growing Oregon digitalis, *Digitalis purpurea* L.

Procedure—Monthly collections were made of both first- and second-year leaves during the spring and summer of 1932–1933. Tinctures were prepared in accordance with U. S. P. specifications. The fat-free preparations were placed in glass-stoppered amber-colored bottles and stored in a cool place in order to retard deterioration (12, 13, 14).

The resulting preparations were biologically assayed by the official "one-hour" frog method (15). Throughout the experiments only healthy frogs of the species *Rana pipiens* (common "grass" or "leopard" frogs) weighing 20–35 Gm. were used. Temperature was kept constant (20° C). The degree of sensitiveness of the frogs was ascertained, using ouabain solution as a standard. Series of standardized frogs were used in assaying the respective tinctures for each particular age and month's collection of digitalis leaves.

An attempt was made to correlate physiological activity with seasonal glucosidal content by the proposed colorimetric method of Knudsen and Dresbach (16).

* An abstract based upon a thesis by Donald Kuo Chih Lee submitted to the Graduate Faculty of the Oregon State College in partial fulfillment of the requirements for the degree of Master of Science.

¹ Scientific Section, A. P. H. A. Madison meeting 1933.

² Department of Pharmacology and Pharmacognosy, Oregon State College, Corvallis.

Results—The seasonal study of wild growing digitalis revealed that the first-year leaves of the December collection were equivalent in potency to the April collection of first-year leaves

FIRST YEAR PLANTS

Collections	*Relative Potency of Preparations (Tr. Dilution 1:5)
November	38.46
April	38.46
June	85.71

SECOND YEAR PLANTS

November	30.00
June	85.71
July	100.00

* Determined by comparison with ouabain as standard (Dilution—1:10,000). Apparently there is very little difference in the physiological activity of the first- and second year plants during June.

CHEMICAL ASSAY

A chemical determination of the active principles was attempted on the monthly samples. The method used was the colorimetric method proposed by Knudsen and Dresbach (16).

Tinctures Tested	Readings in Mm	Number of Mg. in a Cat. Unit (17)
November		
First year plants	38	190
Second year plants	42	210
December		
First year plants	31	155
April		
First year plants	33.2	166
June		
First year plants	24.0	120
Second year plants	26.3	131.5
July		
First year plants	20.6	103
Second year plants	22.8	110.4

Considerable difficulty was experienced due to the inability of comparing the intensity of the tinctures with the standard solution. Several attempts were made but we were not able to get any close results. The standard ouabain solution had a dark yellowish color but the tincture remains a light greenish in color, even after the addition of the neutral lead acetate solution and the alkaline picrate solution. The greenish tint of the tincture is no doubt due to the pigment (chlorophyll) of the digitalis leaves. The volume of neutral lead acetate solution called for in the method was either insufficient or the Oregon digitalis has a greater content of chlorophyll than that which Knudsen and Dresbach experimented with. As it was impossible to compare the intensity of the color of the two solutions, readings were made by attempting to measure the color tints of the two solutions.

CONCLUSIONS

- 1 The physiological activity of the first-year leaves compared favorably with the second-year leaves
- 2 The activity of native digitalis plants under favorable climatic conditions would probably be above U S P standard
- 3 One-hour frog method unsatisfactory chiefly because of the time element which has a tendency toward erratic results
- 4 Observed only a slight difference in the susceptibility of frogs to cardiac stimulants through the various seasons

STUDIES ON THE BIOASSAY OF DIGITALIS *¹

III A NEW DIURETIC OLIGURIC CAT METHOD

BY JAMES H DEFANDORF

Digitalis in toxic amounts has a peripheral constrictor effect on the blood vessels of the kidney in animals (2, 8, 13, 17) which, together with its weakening effect on the circulation, results in a decreased output of urine (oliguria). Since digitalis has a cumulative action, oliguria should follow the repeated administration of small doses and the effect observed by measuring the urine output at short

* Scientific Section, A PH A, continued from Madison meeting A PH A 1933

¹ Department of Pharmacology and Therapeutics School of Medicine The George Washington University, Washington, D C

intervals The increase in toxic activity of the drug, as shown by a constantly decreasing output of urine, should thus serve as a guide to the rate and amount of administration in intravenous methods of assay, and, by indicating the approach of death, make possible a more accurate determination of the minimum lethal dose than can be obtained by the continuous intravenous injection method of Hatcher and Brody (10, 11) and its modifications (1, 12, 19)

The cat was selected as the experimental animal because it can readily be made to exhibit diuresis Moreover, it is the animal most used in this country for the assay of digitalis by an unofficial method

Three tinctures of digitalis were tested, and their effects on urine output were observed following repeated intravenous administration of sub-lethal doses The change from diuresis to oliguria was studied in its relation to the approach of death The minimum lethal doses were determined and compared with those of the subcutaneous (15), new leg-vein (5) and new intramuscular (5) minimum lethal dose guinea-pig methods, and with systolic standstill doses of the U S P X (18),

modified four-hour U S P X (4), Smith-McClosky intravenous (16) and Dooley-Higley intramuscular (6) frog heart methods

EXPERIMENTAL PROCEDURE

Male and female cats, ranging in weight from 15 to 43 Kg were used They were placed on a milk diet for about a week previous to the experiment, and in a few cases raw liver was added to the diet, but was later omitted when found to be unnecessary The animals were weighed immediately before the experiment, and the dosages of both the anesthetic and digitalis were calculated on this basis In some of the first experiments water was given by stomach tube immediately

Fig 1—Graphic representation of urine output in the cat following intravenous administration of repeated doses of digitalis (Cat No 13 10/17/33, also see protocol)

before administration of the anesthetic in order to insure an adequate output of urine, but this also was found to be unnecessary and was omitted in the later experiments Sodium barbital, 0.25 to 0.3 of a gram per Kg, was given by stomach tube, and usually excellent anesthesia was obtained by the end of the hour, occasionally a few inhalations of ether were necessary in the induction of anesthesia, and at times during the course of the experiment, which usually lasted several hours

When anesthesia was complete, the femoral vein was exposed for use in intravenous injection A small median incision was made in the lower abdomen, exposing the bladder, and the urine removed by gentle compression or by a hypodermic syringe and needle A small thistle tube cannula was then inserted in the bladder through a small incision, and carefully tied in so as to avoid obstructing the ureters By means of rubber tubing this was connected with a long glass tube, and the system filled with warm saline As fluid began to drop from the distal end of the tube it was collected in tared flasks at stated intervals usually of ten minutes, throughout the course of the experiment, and weighed, the amount of urine excretion being plotted on graph paper

The digitalis solution was prepared for injection by evaporating all alcohol from the tincture and diluting the residue with physiological saline to a 5 per cent solution, so that 1 cc represented 50 mg of the leaf When the urine secretion reached a normal level, which on the average was about thirty minutes after cannulation of the bladder the first injection of digitalis was made with

The minimum lethal doses for tincture "B" are exceptionally uniform, but this is not true for tinctures "C" and "D". The greatest variations from the average minimum lethal doses for "C" and "D" occurred with animals below (3, 15, 24) 2 Kg or above 3 Kg (4, 30)

TABLE I—COMPARISON OF MINIMUM LETHAL DOSES OF TINCTURE 'B,' "C" AND "D" BY THE DIURETIC OLIGURIC CAT METHOD

	New diuretic oliguric	0 074	0 095	0 087

* Frog methods

¹ Guinea pig and cat methods

Table II summarizes the results of assays of tinctures 'A' "B" and "C" on frogs, guinea pigs and cats. Tincture 'C' was exhausted before frog assays could be made. Analysis of this table permits the following deductions:

Tinctures "B" and "D" are practically identical in activity as tested by four frog heart methods.

Tincture 'B' is slightly stronger than 'C' and 'D' by the guinea-pig methods, 'C' and 'D' being of equal strength by these tests

Tincture "B" is strongest by the diuretic oliguric cat method, whereas "C" is weaker than "D"

The results of the frog and guinea pig methods are in closer agreement with each other than they are with those of the cat method

When measured by the results of the intravenous frog, new intravenous guinea-pig and new diuretic oliguric cat methods, digitalis is about twice as toxic to the cat as to the guinea pig and about twice as toxic to the guinea pig as to the frog

Cat = 1 Guinea pig = 2 Frog = 4

DISCUSSION

The assays reported above corroborate many observations made in the literature concerning the variations in susceptibility of cats to digitalis (7, 9, 14). The assays on tincture "B" are remarkably uniform, in contrast to the large positive and negative variations in the results obtained with tinctures "C" and "D". Large variations in susceptibility in frogs and guinea pigs are of less importance because large numbers of these animals can be used in contrast to cats, where the experimental procedure is much more prolonged, and the animals more difficult to obtain in large numbers. When small numbers of animals are used for an assay it seems logical to agree with Burn (3) that it is indefensible to set aside the results obtained from one or two cats which show a great difference from the others, such as Cats No 3 and No 4 in tincture "C" (Table I). Burn points out that owing to the large range in sensitivity of cats, "the average of three cats, for example, can never be assumed to be nearer the true value than that of four," and states that the average of results on a small number of cats is more nearly the true value as the number of cats is increased, the true results being obtained from the average of a very large number, such as one hundred.

In the new diuretic oliguric cat method just described the drug is not injected continuously, and this would appear to be an advantage not possessed by the intravenous methods usually employed. As digitalis is a drug which acts slowly, it would appear impossible to get an accurate determination of its true activity when employing a comparatively rapid continuous injection method.

Following the early diuretic effect, the repeated administration of small doses produces a constantly decreasing output of urine (oliguria), a condition due to toxic action, and an excellent indicator of the approach of death, more easily discernible than the heart changes ordinarily observed by auscultation in the usual cat method. Anuria occurs sometimes, before death.

It should also be observed that the best results were obtained with cats ranging in weight from 2 to 3 Kg, in the relatively small number of animals used. Cats above or below these weight limits showed a wider variation in susceptibility. These weight extremes may be identical with extremes in age which might account for the variations in resistance.

SUMMARY AND CONCLUSIONS

A new intravenous cat method for the bioassay of digitalis is described, which utilizes the changes produced in urinary output to determine the amount and frequency of administration of the drug.

The progress from diuresis to oliguria following intravenous injection of successive doses of digitalis is a useful index of the development of toxic activity of the drug, and thus serves as a guide to the frequency and amount of its administration

Cats showed wide individual variations in their susceptibility to digitalis, and their value in the assay of this drug appears questionable since in practice only a few animals are used

Results of frog and guinea-pig assays agreed more closely with each other than with those of the cat method

THE RECTAL ABSORPTION OF DIGITALIS IN CATS *

BY W ARTHUR PURDUM

INTRODUCTION

Digitalis and its preparations, when administered by mouth, frequently cause nausea and vomiting To overcome this untoward effect, Eichhorst, first (3), and later, other investigators have suggested administration by rectum Therefore, digitalis preparations intended for rectal administration in suppository form and in solution have been offered to the medical profession within the last few years

The available clinical reports on the administration of digitalis by rectum are favorable It, therefore, seemed desirable to determine the preparation best suited for rectal use With this objective in view, two preliminary experiments were conducted to determine whether or not digitalis is absorbed from the cat rectum Large

* From the laboratories of A G DuMez, Professor of Pharmacy, and Marvin R Thompson, Professor of Pharmacology School of Pharmacy of the University of Maryland Compiled from a thesis submitted to the Faculty of the Graduate School of the University of Maryland in partial fulfillment of the requirements for the degree of Master of Science

doses of a dealcoholized fluidextract were administered and positive absorption was noted. A comparative study was then made of the rectal absorption of digitalis from different vehicles.

EXPERIMENTAL

A fluidextract of digitalis accurately standardized as to potency was dealcoholized by evaporation at a low temperature. Two anesthetized cats were then given approximately 20 M L D and 10 M L D of this solution by rectum. Difficulty was encountered in keeping the digitalis solution in the rectum due to the severity of the irritation produced. However, the cats received sufficient digitalis to cause death in from 3 to 3½ hours. These results show that digitalis is absorbed when given rectally.

For the purpose of obtaining comparative data on the rate of absorption of different preparations of digitalis when given by rectum, 5 additional series of experiments were conducted. In the first series, 5 separate experiments were carried out and in each of the remaining series, from 9 to 15 experiments. In all cases, the cats were anesthetized and kept under light anesthesia throughout the experiments by means of intraperitoneal injections of one of the barbiturates and, in some cases, ether was used as a supplement. Expulsion of the digitalis preparations was prevented by the application of anal clamps. About 5 hours after the administration of the rectal preparation, an amount of standardized digitalis solution sufficient to cause death was introduced intravenously.

SERIES NO 1

Suppositories were prepared, each containing the following

Powdered Digitalis	0.3 Gm (3 cat units)
Cacao Butter	1 Gm

The results of the experiments with these suppositories are shown in Table I.

TABLE I—ABSORPTION OF DIGITALIS POWDER IN CACAO BUTTER SUPPOSITORIES ADMINISTERED BY RECTUM

Cat No	Weight of Cat in Kg	No of Cat Units Given	No of M L D Given	Time Allowed for Absorption in Hrs and Min		Cc Administered Intravenously (10 Cc Represents 1 Cat Unit)	No of Cat Units Absorbed	No of M L D Absorbed
1	1.93	3	1.55	6	7	20.0		
2	1.91	3	1.57	4	44	24.1		
3	1.77	3	1.69	5	3	22.5		
4	1.72	3	1.74	5	43	10.0	0.72	0.42
5	1.15	3	2.60	6	38	8.8	0.27	0.23

Since cats Nos. 1, 2 and 3 showed no absorption and cats Nos. 4 and 5 showed very slight absorption, the amount of digitalis given was increased in the next series of experiments.

SERIES NO 2

Each suppository used in this series contained

Extract of Digitalis	0.375 Gm (15 Cat units)
Cacao Butter, sufficient to make	2 Gm

An extract of digitalis, 4 times the strength of the powdered digitalis used in the previous series, was used because the incorporation of an equivalent amount of powdered digitalis would have been impractical due to its bulk.

TABLE II—ABSORPTION OF EXTRACT OF DIGITALIS IN CACAO BUTTER SUPPOSITORIES ADMINISTERED BY RECTUM

Cat No	Weight of Cat in Kg	No of Cat Units Given	No of M L D Given	Time Allowed for Absorption in Hrs and Min	Cc Administered Intravenously (10 Cc. Represents 1 Cat Unit)	No of Cat Units Absorbed	No of M L D Absorbed
6	3 15	15	4 76	6 20	33 7		
7	2 80	15	5 35	See below		2 80	1 00
8	2 80	15	5 35	5 50	26 5	0 15	0 05
9	2 75	15	5 45	5 53	32 5		
10	2 73	15	5 49	5 6	17 2	1 01	0 37
11	2 56	15	5 85	6 10	31 6		
12	2 54	15	5 90	4 12	25 2	0 02	0 01
13	2 47	15	6 07	5 19	11 0	1 37	0 55
14	2 45	15	6 12	5 47	20 6	0 39	0 16
15	2 43	15	6 17	5 24	11 6	1 27	0 52
16	2 35	15	6 38	5 10	20 3	0 32	0 14
17	2 27	15	6 60	3 38	17 2	0 55	0 24
18	2 25	15	6 66	5 56	16 7	0 58	0 26
19	1 89	15	7 93	5 27	17 0	0 19	0 10

Cat No 7 died about 3 hours after insertion of the suppository. An autopsy revealed that the heart was in systole which is an indication of digitalis poisoning. However, the cat may have been abnormal and may have died from other causes. Cats Nos 6, 9 and 11 showed no rectal absorption and actually required more solution intravenously than should have been needed theoretically had no digitalis been given rectally.

TABLE III—ABSORPTION OF EXTRACT OF DIGITALIS IN GLYCERINATED GELATIN SUPPOSITORIES ADMINISTERED BY RECTUM

Cat No	Weight of Cat in Kg	No of Cat Units Given	No of M L D Given	Time Allowed for Absorption in Hrs and Min	Cc Administered Intravenously (10 Cc. Represents 1 Cat Unit)	No of Cat Units Absorbed	No of M L D Absorbed

34	1 55	15	9 68	5 59	14 3	0 12	0 08

SERIES NO 3

The base for the suppositories which were given throughout this series of experiments was Glycerinated Gelatin, U S P X. Extract of Digitalis of the same lot as that employed in Series No 2 was again used. The suppositories were prepared on two different occasions by the formulas which follow.

Lot No 1	Extract of Digitalis	0 225 Gm (9 cat units)
	Glycerinated Gelatin, sufficient to make	2 4 Gm
Lot No 2	Extract of Digitalis	0 375 Gm (15 cat units)
	Glycerinated Gelatin, sufficient to make	2 4 Gm

In both cases, the extract was thoroughly incorporated with the fused glycerinated gelatin after the source of heat had been removed from the base. This procedure prevented prolonged heating of the extract which would inactivate the digitalis principles.

In those cases in which the suppositories containing 9 cat units of digitalis were used, it was necessary to administer a fraction more than one suppository to approximate the dosage desired.

SERIES NO 4

The results obtained in the preceding experiments indicate relatively poor absorption when cacao butter or glycerinated gelatin are used as suppository bases. It was, therefore, inferred that, perhaps, the absorption was retarded by these bases. To determine the correctness of this observation, a series of experiments was run in which gelatin alone was used as the base and in which the proportion of the latter was reduced to a minimum. This was accomplished by administering No 1 hard gelatin capsules into which 0 375 Gm (15 cat units) of extract of digitalis was packed. Prior to insertion of the capsules water, in an amount equal to about 10 cc, was injected into the rectum to aid the dissolution of the capsule material.

TABLE IV—ABSORPTION OF EXTRACT OF DIGITALIS IN HARD GELATIN CAPSULES ADMINISTERED BY RECTUM

Cat No	Weight of Cat in Kg	No of Cat Units Given	No of M L D Given	Time Allowed for Absorption in Hrs and Min	Cc Administered Intravenously (10 Cc Represents 1 Cat Unit)	No of Cat Units Absorbed	No of M L D Absorbed
35	3 80	15	3 95	5 4	34 9	0 31	0 08
36	3 15	15	4 76	5 13	30 7	0 08	0 03

40	2 87	15	5 23	5 47	23 0	0 57	0 20
41	2 85	15	5 26	5 38	25 8	0 27	0 09
42	2 85	15	5 26	5 20	25 0	0 35	0 12
43	2 40	15	6 25	5 0	21 6	0 24	0 10
44	2 23	15	6 73	6 21	23 3		
45	2 13	15	7 04	5 39	16 3	0 50	0 23
46	1 80	15	8 33	5 19	10 5	0 75	0 42
47	1 80	15	8 33	5 7	14 5	0 35	0 19
48	1 70	15	8 82	5 46	14 0	0 30	0 18

The heart beat of cat No 37 was weak and irregular throughout the experiment. After death, the heart was examined and found to be in diastole which throws doubt upon the probability of death from digitalis.

SERIES NO 5

In the experiments which follow, the possible influence of any extraneous matter was eliminated completely by injecting a dealcoholized tincture of digitalis. The tincture was prepared by the U S P X method and the alcohol was removed by heating to about 50° C in an open vessel, over which a current of warm air was passed until all of the alcohol had evaporated. The solution was injected by means of a rectal tube attached to a hypodermic syringe.

TABLE V — ABSORPTION OF DIGALCOHOLIZED TINCTURE OF DIGITALIS ADMINISTERED BY RECTUM

Cat No	Weight of Cat in Kg	No of Cat Units Given	No of M L D Given	Time Allowed for Absorption in Hrs and Min		Cc Administered Intravenously (10 Cc Represents 1 Cat Unit)	No of Cat Units Absorbed	No of M L D Absorbed

57	1 87	9 35	5	5	46	16 3	0 24	0 13

Cat No 55 died about three hours after receiving the rectal digitalis solution. It is believed that digitalis was the cause of death because the usual symptoms of digitalis poisoning were noted.

CONTROL EXPERIMENTS

During the course of the experiments, the problem arose as to whether or not the prolonged anesthesia and the clamping of the anus materially affected the results obtained. To solve this problem, control experiments were run as follows:

Two cats were anesthetized in the manner employed throughout this work. As soon as anesthesia was induced the ani were clamped to simulate the conditions when digitalis was administered rectally. After about six hours digitalis solution was introduced intravenously in an amount sufficient to kill the cats. This amount was found to be within 10% of the calculated minimum lethal dose in both cases.

DISCUSSION

The available published clinical reports highly recommend rectal digitalis therapy (2, 3, 4, 5, 6, 7, 8 and 9), citing several advantages for it over the oral method, and suggest it as a substitute for intravenous and subcutaneous administration. The results of the investigations upon which the findings reported in this paper are based do not confirm those reported by clinicians. While it is true that in the experiments from which these results were obtained the test animals used were cats and the drug was administered under abnormal conditions, *i e*, prolonged anesthesia and clamping of the anus, it has been shown by control experiments that these abnormalities caused no perceptible effect on the susceptibility of the cats to the drug. It is possible, however, that the application of anal clamps may have either hastened or retarded absorption.

The absorption of digitalis from the rectum was found to be very slow and small in amount considering the large doses which were administered. Nausea and emesis occurred in the interval elapsing between the rectal administration and the intravenous administration of the drug in approximately half of the experiments. This may have been caused by the anesthetic since emesis was observed in one of the controls. The digitalis was observed to be quite irritating to the rectum since it was necessary to clamp the anus to prevent expulsion of the drug and since autopsies disclosed considerable inflammation, even in the recta of those cats on which anal clamps were not used. The rate of absorption from the rectum was also found to be irregular and inconsistent as evidenced by the large variations in the amounts which were absorbed by different cats.

Scrutiny of the preceding tables shows that digitalis is more rapidly absorbed from the rectum when administered in the form of the dealcoholized tincture than in the other forms which were employed. Following, in the order of rapidity of absorption, are glycerinated gelatin suppositories, cacao butter suppositories and finally, hard gelatin capsules.

Since available clinical results indicate rapid rectal absorption, it is evident that either the procedure of study which has been followed does not reflect accurately the absorption in the human, or, it is possible that the means by which other workers made their observations are not sufficiently dependable. Whether or not the procedure used in this work reflects the absorption rate in humans, it is believed that a comparative study of rectal, oral and subcutaneous absorption using this technique, will provide reliable information on the relative absorption rate through the above three avenues of administration in humans. However, future work is contemplated to compare relatively these three means of administration.

In view of the foregoing work, it appears that the rectal mode of giving digitalis may be a good one when digitalization is to be maintained over a rather lengthy period and when a prompt action is not essential.

CONCLUSIONS

- 1 Digitalis is absorbed from the rectum
- 2 The rectal absorption in cats is very slow, irregular and erratic
- 3 Considerable irritation and inflammation was found to be produced in the rectum as a result of rectal administration of digitalis
- 4 The most rapid absorption by rectum was observed when a dealcoholized tincture of digitalis was given
- 5 The actual significance of these results will not become evident until the absorption rate following oral administration has been determined in the same manner
- 6 The rectal method for administering digitalis should be subjected to more investigation before it be accepted as conventional

NON-HEPTANE CONSTITUENTS OF DIGGER PINE (PINUS SABINANA)

BY ARTHUR H UHL *

In 1928, Foote (1), in cooperation with the Ethyl Gasolene Corporation of Yonkers, N Y, rectified the principal constituent of Jeffrey Pine oil, heptane. The non-heptane constituents of the oil were further investigated. This investigation revealed the presence of *n*-octylic, *n*-nonylic and *n*-decylic aldehydes.

Approximately 20 gallons of that portion of the oil of digger pine which boils above 110° was received from the California Chemical Corporation. The heptane which constitutes approximately 90-93 per cent (2) of the oil had been previously removed. The 20 gallons, therefore, represented between 1800 and 1900 gallons of the original oil.

Isolation of the Aldehydes—The aldehydes were removed from the oil by shaking with a 30% solution of sodium acid sulphite. The solid addition product was separated on a force filter and washed with ether. The aldehydes were regenerated by treatment with sodium carbonate and separated by steam distillation. There resulted 625 Gm of aldehydes. The aqueous sulphite mother liquor was treated likewise and an additional 51 Gm were obtained.

Identification of the Aldehydes—Because excess heating was likely to destroy or change some of the higher aldehydes, the first fractionation was run as rapidly as possible. The 625 Gm of aldehydes were fractionated, under a pressure of 3 mm, into ten convenient fractions using a short Vigreux column.

	B P	Sp Gr
1	- 45°	0.8182
2	45- 50°	0.8236
3	50- 60°	0.8260

5	70- 80°	0.8400
6	80- 90°	0.8560
7	90-100°	0.8563
8	100-110°	0.8501
9	110-120°	0.8520
10	120-130°	0.8495
11	Residue	

Inasmuch as decomposition took place in Fractions 9 and 10, distillation was discontinued.

Although the fractions obtained gave some indication as to the possible aldehydes present, the melting points of derivatives were inconsistent and not sharp. The individual fractions were refractionated under a pressure of 10 mm using a 12-inch Widmer column.

The various fractions yielded

Fraction No 1	Fraction No 4
a -56°	a 74-76°
b 56-58°	b 76-78°
c 58-60°	c 78-80°

Fraction No 7

Decomposition began and distillation was discontinued

By way of comparison, the constants of the aldehydes and derivatives of previous workers may be tabulated with those found

FRACTION No 2

	Found	Recorded for <i>n</i> Octyl Aldehyde
B p	60-62°	60-63° at 10 mm (3)
Sp Gr	0.8236 at 20°	0.8211 at 20° (3)
<i>n</i> _D	1.4206 at 20°	1.4955 (4)
<i>α</i> _D	±0	±0 (4)
M p of thiosemicarbazone	94-94.5°	94-95° (5)

This fraction corresponds to *n* octyl aldehyde

FRACTION No 3

	Found	Recorded for <i>n</i> Nonyl Aldehyde
B p	70-74° at 10 mm	72° at 10 mm (6)
Sp Gr	0.8297 at 20°	0.8277 at 15° (7)
<i>n</i> _D	1.4273 at 20°	1.42452 at 16° (7)
<i>α</i> _D	±0°	±0° (7)
M p of thiosemicarbazone	77°	77° (5)

This fraction corresponds to *n* nonyl aldehyde

FRACTION No 6

	Found	Recorded for <i>n</i> Decyl Aldehyde
B p	90-92° at 10 mm	92° at 10 mm (8)
Sp Gr	0.8502 at 20°	0.8538 at 15° (9)
<i>n</i> _D	1.4287 at 20°	1.4273 (9)
<i>α</i> _D	±0°	±0° (9)
M p of thiosemicarbazone	99-100°	99-100° (5)

This fraction corresponds to *n*-decyl aldehyde

On standing in a refrigerator, Fractions 7, 8 and 9 became partly solid. The solid white material was collected on a force filter, recrystallized from alcohol and dried. It had a melting point of 42° to 43°. After further purification by recrystallization from alcohol the melting point remained unchanged.

Laurel Aldehyde	Found	Recorded
M p	42-43°	44.5° (10)
M p thiosemicarbazone	100-100.5°	101.5-102.5° (11)

This fraction corresponds closely to laurel aldehyde which is indicated

The mother liquor was placed in a refrigerator and again solid material separated which partly liquefied when an attempt was made to collect it at room temperature. The solidifying point was determined and found to be 22.5°

Myristic Aldehyde	Found	Recorded
M p	22.5°	23° (12)
M p oxime	82.5-83.5°	82.5° (12)
M p semicarbazone	101.5°	100-101° (13) 106° (12)

This fraction corresponds to myristic aldehyde

There are indications of other aldehydes present, especially those with a larger number of carbon atoms, but it was impossible to obtain derivatives pure enough to characterize the compounds

CONCLUSION

N-octylic, *n*-nonylic, *n*-decylic and *n*-myristic aldehydes have been isolated and identified and *n*-lauric aldehyde is indicated

RUSSIAN ERGOT

BY H. H. RUSBY

No specific account of Russian ergot, cured as our Pharmacopœia directs, and preserved in its natural state, has come to my attention. All published information that I have seen has related to commercial supplies, which have been accurately described by Henning as "usually arriving in a damp and moldy condition."

More than a year ago, I entered into communication with the Russian department of agriculture for the procural of samples officially prepared and sent direct, so as to arrive in an unaltered state. I made it clear that my criticisms of Russian ergot had no relation to Russia or its products as such, but had been made wholly in the interest of improvement of the materia medica. Several years ago, I had urged our food and drug authorities to secure, through our State Department, co-operation with Russia in the investigation of this subject and in the improvement of the latter's product, but without result. The Committee of Revision has taken no steps, as a part of their research work, to ascertain the facts regarding this drug. Thus I, perforce, took it up myself.

In the spring of 1934 I received official assurance that during the coming harvest the desired samples would be prepared and sent to me, and in the Fall the following collections were received

- No 1 Collected at Verhovski, Central Russia District, Select Experiment Station, August 1934
- No 2 Collected at Gorkey Province, formerly Nijniy, Novgorod, Plant Protection Institute, August 14, 1934
- No 3 Collected at West Russia Minsk Agricultural Experiment Station, August 19, 1934
- No 4 Collected at West Russia (Belorussia), Minsk Agricultural Station, August 20, 1934
- No 5 Collected at Central Russia, Voronej Agricultural Experiment Station, August 1934
- No 6a Collected at Ukraine Kalirkov Province, from a barn in the survey District August 1934
- No 6b Obtained from a grain elevator in the same place
- No 0 Collected in Central Russia, Black Earth Province, Semilovski District, Moronej Station for Plants August 1934

Later, a second shipment was received, containing the following samples

- From East Siberia Select Center, Voronej District, September 8, 1934
- From southeast Russia, Saratov Region
- Two others, locality not specified

The differences observed among these samples were of minor importance and insignificant, the important questions relating to their agreement with or disagreement from Spanish ergot, and the Russian ergot that has been known in the American market. The most important of these questions related to the color of the fractured surface. That of Spanish ergot is characteristically white. That required by our Pharmacopœia is "white, tinged with pink or gray" (see ergot monograph, published by the Revision Committee, September 1, 1934). The most careful examination of the official and authentic samples here considered fails to show any grains having a "pink" or any other than a white fracture! Since these samples represent all the important collecting districts of Russia, the conclusion is inevitable that normal Russian ergot exhibits only a white fracture.

This naturally raises a question as to why the Committee of Revision should have specified the pink fracture, irrespective of its source. This must be because the Committee has depended for its description on the color ordinarily presented by the Russian ergot that has been admitted to use in this country, and which has been pink or purplish. As a matter of fact, it is known to every one that practically all the Russian ergot that has been in use in the United States until recently has shown this purplish fracture and has therefore been at disagreement with the normal product, as now shown by the samples under consideration. This in turn must be due to the fact that these supplies have undergone a color change as a result of the "damp and moldy" conditions to which they have been subjected.

In order to verify this conclusion, I made a mixture of portions of all the samples, soaked them thoroughly in water and permitted them to lie in a warm place until badly decomposed, whereupon they were found to have the "pink" or purplish color on fracture.

We have, however, a somewhat more practical evidence of this fact. It is a fact that our food and drug officials, as a result of the famous ergot controversy of the past few years, have discontinued the admission of the damaged ergot with pink fracture referred to, so that, at the present time, we find the Russian ergot of our market of good quality and presenting the same white fracture and characteristic odor as that of the official samples here considered.

A very remarkable situation is thus presented. The Committee of Revision, basing its action on a knowledge of the adulterated article formerly common in our market, specifies the pink fracture of that product, but the food and drug officials correct their former practice, excluding the adulterated article, and by doing so, directly violate the present Pharmacopœia requirement! What can be done to harmonize the existing contradiction? Two alternatives are presented. The Pharmacopœia Committee may correct its description, or the food and drug officials may resume their former custom, in order to conform with the Pharmacopœia. The only other possible course would be to subject all sound Russian ergot to a process of soaking and fermentation, in order to develop the required pink color.

An interesting question is how the Russian ergot of commerce came to be changed from its natural state so as to acquire the purplish color. At present, this can only be conjectured, but it is my personal opinion that somewhere on its way from production to importation, it has been moistened in order to increase its weight, the resulting decomposition having then occurred.

Aside from the matter of fracture-color and odor, this official ergot shows little difference from the well-known sound product of Spain and Portugal. Indeed, there is no good reason why this difference in fracture-color should exist between individuals of the same plant species as grown in two countries. The grains have the same clear, bright outer surface and characteristic odor as the Spanish article. Externally, the color is not such a dark chocolate as that of the Spanish. It might, perhaps, be better described as of a dull black, ranging toward gray-black, and with a slightly reddish tinge when viewed in a strong light. Number 6 is almost black, Nos. 1 and 4 almost equally so, Nos. 2 and 3 almost as dark, and both show a little more of the reddish tinge mentioned. Numbers 5 and 0 show the grayish tinge mentioned.

In form, the grains do not differ greatly from the Spanish, although in general a little more slender and smaller. The following table shows the sizes.

No	Average Length	Thickness
1	1.6 cm	3 to 5 mm
2	1.3 cm	2 to 4 mm
3	1.6 cm	2.5 to 6 mm
4	1.6 cm	3 to 5 mm
5	1.3 cm	2 to 3 mm
6	1.4 cm	2.5 to 4 mm
0	1.1 cm	1.5 to 3 mm

NOTE. Harry Taub, Assistant Professor in my Department, in collaboration with Abraham Taub, Assistant Professor in the Department of Chemistry, performed a series of chemical assays on the fluidextracts of Russian ergot and Spanish ergot referred to in this article and found that there is practically no difference between the two ergots when the fluidextracts are made from a good quality crude drug. Their assays showed an average of 0.64 mg. of ergotoxine ethanesulphonate per 100 cc. of fluidextract of Russian ergot and 0.65 mg. per 100 cc. of fluidextract of Spanish ergot.—H. H. R.

A very striking difference is found between the Spanish and normal Russian ergots after being powdered, the Russian powder being blackish, the Spanish light brown and with a strong pinkish tinge

The following conclusions are clearly established by the evidence here given

- 1 The normal fracture color of all ergot is white
- 2 The purple fracture color that has been commonly seen in Russian ergot is the result of decomposition caused by exposure to dampness and resulting putridity
- 3 The specification by the U S P Revision Committee of pink color in the fracture of ergot is the result of the former prevalence in our drug market of such decomposed ergot
- 4 At the present time, the Russian ergot in the American market is in general of sound quality and exhibits a white fracture color
- 5 All reference to pink fracture should be eliminated from the U S P description of ergot
- 6 Whatever method of bio assay may be adopted should be based on tests made with ergot of white fracture Tests that have been made with the deteriorated ergot of pink fracture should be scrapped

All the specimens of Russian ergot herein referred to are preserved in the museum of the New York College of Pharmacy, where they may be seen

That portion of the same samples that has been caused to develop the purple fracture color by decomposition is also preserved at the same place

A sample of Russian ergot, such as is now being sold in the New York market, of sound quality and exhibiting a white fracture, will also be found there

Portions of all the above samples have been submitted and deposited with this paper

To anyone who still retains enough interest in the cockscomb test to apply the same, samples of the fluidextract made from these sound Russian ergots and from similar sound Spanish ergot, will be supplied upon request

STUDY OF GERMICIDAL AND ANTISEPTIC ACTIVITY OF SOME MERCURY COMPOUNDS *¹

BY E. MONESS, S. E. HARRIS AND W. G. CHRISTIANSEN

Three compounds were selected for this study, 3,3'-dibromo-4,4'-dihydroxy-5,5'-diacetoxymercuri diphenyl dimethyl methane (I), 3,3'-dinitro-4,4'-dihydroxy-5,5'-diacetoxymercuri-diphenyl-dimethyl-methane (II), and a mono acetoxy-mercuri-derivative of 5,5"-dibromo-resorcinol diphenem (III). The position

of the mercury in the product (which will be designated as (IV)) obtained from (III) was not determined. Mercurated dibromo fluoresein is believed to be mercurated in one of the resorcinol nuclei. However, recent studies in this laboratory on mercurated dibromo diphenyl-phenol-phthaleins (1) and mercurated derivatives of substituted diphenol-isatin (2) strongly suggest that this type of compound may mercurate in the phthalic acid, diphenic acid or corresponding portions of the molecule.

The three compounds all showed useful germicidal activity.

TABLE I—TESTED IN DISTILLED WATER

Compound	Dilution Killing Typhoid		Dilution Killing Staphylococcus Aureus	
	5 Min	10 Min	5 Min	10 Min
(I)	1-1500	1-1500	1-1500	1-2500
(II)	1-1000	1-1500*	1-5000	1-5000
(IV) a 1st batch	1-250	1-2000	1-500	1-1000
b 2nd batch	1-1000	1-4000	1-500	1-1000

* Inhibits growth only—does not kill

TABLE II—TESTED IN BLOOD SERUM

Compound	Dilution Killing Typhoid		Dilution Killing Staphylococcus Aureus	
	5 Min	10 Min	5 Min	10 Min
(I)	1-500	1-500	1-1000	1-1500
(II)	Not Tested			

* Section on Practical Pharmacy and Dispensing, Madison meeting, 1933

¹ Research Department of the Chemical and Pharmaceutical Laboratories, E. R. Squibb and Sons, Brooklyn, N. Y.

(IV)	a	1st batch	1-100	1-1000	1-250	1-500
	b	2nd batch	1-250	1-1000	1-100	1-500

Compound (IV) was further tested for bacteriostatic activity

Batch	Dilution at Which Compound Is Bacteriostatic Typhoid Staphylococcus			
	24 Hrs	48 Hrs	24 Hrs	48 Hrs
1	1-20 000	1-10 000	1-30 000	1-20,000
2	1-100,000	1-50,000	1-500,000	1-250,000

The examination also included tests of the action of compounds (I) and (IV) on tissue, with the following results

Compound I—1 Non irritating to shaved unabraded skin and to shaved abraded skin
2 Produces slight to moderate swelling in subcutaneous tissue on repeated injection persisting for 21-24 days
3 Autopsies following injection showed no degenerative changes due to the toxicity of the compound in liver or kidney The autopsies were performed at the end of the test, so that no information was furnished as to possible temporary toxic action

Compound IV—1 Non irritating to shaved and unabraded skin
2 Only slightly irritating to shaved abraded skin
3 Produces very slight swelling on subcutaneous injection and a scab at the site of intradermal injection

Solutions Used in Tests—The compound (IV) was prepared for test by dissolving in water containing 2 molecular equivalents of sodium hydroxide and diluting to a final concentration of 2% This solution was diluted with distilled water immediately prior to the germicidal and bacteriostatic tests The same solution was used in the animal experiments

Solution of Compound (I) was effected in an exactly similar manner, except that the original concentration was 1-500 Compound (II), however, required a large excess (about 15 mols) NaOH to produce a clear 1-250 or 1-500 solution The latter concentration was used for testing

The animal experiments were conducted on albino rats

EXPERIMENTAL

The preparation of these compounds was carried out along familiar lines, mercuration of the suitable intermediates being effected in boiling alcohol solution

Resorcinol Diphenem—The diphenem required for compound (IV) was prepared by the procedure of Dutt (3) The starting material was technical 70% phenanthrene which was oxidized to phenanthraquinone by the method of Oyster and Adkins (4) and subsequently to diphenic acid according to German Patent 516,282, using sodium peroxide as the oxidizing agent Diphenic anhydride was then prepared by the method of Oyster and Adkins (5) and condensed with resorcinol (3) The product, however, did not melt at 172° C as stated by Dutt but softened at 70° C and is completely melted at 100° C The bromine derivative, however, was prepared without difficulty

Dibromo Resorcinol Diphenem—Thirty-five cc of a 20% solution of bromine in glacial acetic acid was added to a well stirred solution of 8.6 Gm of resorcinol diphenem in 170 cc glacial acetic acid The mixture was heated on the steam-bath for fifteen minutes and poured into 2000 cc of cold water The yellow flocculent precipitate was filtered off, washed with water and dried giving a yellow powder

0.2277 Gm of substance required 7.92 cc of N/10 AgNO₃ solution

Br found, 27.83%

Calculated for C₂₆H₁₄O₃Br₂, 28.26%

Mercuration of Dibromo Resorcinol-Diphenem—Fifteen Gm of dibromo resorcinol diphenem was dissolved in 250 cc of alcohol and the solution refluxed with good stirring A solution of 8.41 Gm of mercuric acetate in 42 cc of water slightly acidified with acetic acid was then added dropwise during 45 minutes to the well stirred, boiling diphenem solution After boiling and stirring for a further period of 15 minutes a brown precipitate had formed and the clear superna-

tant liquid gave a negative test for inorganic mercury with ammonium sulphide and sodium hydroxide. The precipitate was filtered off, washed with alcohol and dried *in vacuo*. Yield—16 Gm. The substance was a brownish purple powder insoluble in the common organic solvents but readily soluble in alkali hydroxide solutions. Such solutions were dark red by transmitted light, opaque with a greenish fluorescence by reflected light, and did not stain the skin.

0.2523 Gm. of sample gave 0.0728 Gm. of mercury

Hg found, 28.80%

Calculated for $C_{24}H_{16}O_6BrHg$, 24.22%

The high mercury content indicates contamination with the diacetoxy mercury compound or hydrolysis to the hydroxymercuri derivative. This point was not investigated since the use of the compound in aqueous alkaline solutions inevitably transforms any acetoxy derivative to the hydroxy form.

4,4'-Dihydroxy Diphenyl Dimethyl Methane—One hundred and eighty-eight Gm. phenol, 30 Gm. acetone and 15 Gm. phosphorus oxychloride were mixed at 20° C. The temperature was then raised to 40–45° C. and a further 15 Gm. phosphorus oxychloride added. The mixture was allowed to stand for 72 hours during which time it set to a solid mass. This was broken up, treated with water and steam distilled to remove excess phenol. The residue was cooled with vigorous stirring. The granular product was filtered off, washed with water, dried and purified by distillation *in vacuo*.

B. p., 225–230° C. /4 mm. M. p., 144° C.

Yield—119 Gm.

0.2297 Gm. gave CO_2 0.6627 Gm., H_2O 0.1458 Gm.

	Carbon	Hydrogen
Found	78.7%	7.11%
Calculated for $C_{16}H_{16}O$	78.9%	7.06%

3,3'-Dinitro-4,4'-Dihydroxy Diphenyl Dimethyl Methane—Thirty-one Gm. of 4,4'-dihydroxy-diphenyl dimethyl methane was dissolved in 300 cc. glacial acetic acid and to the well stirred solution 14 Gm. concentrated nitric acid was added dropwise. After standing twenty minutes the reaction mixture was poured into 1500 cc. of cold water. The gummy precipitate was washed with cold water and recrystallized from 250-cc. absolute alcohol. It formed a yellow microcrystalline powder.

M. p., 132° C.

0.3115 Gm. gave 23.5 cc. moist N_2 at 24° C. and 767 mm.

N found, 8.5%

Calculated for $C_{16}H_{10}N_2O_6$, 8.9%

3,3'-Dinitro-4,4'-Dihydroxy 5,5'-Diacetoxy Mercuri Diphenyl Dimethyl Methane—10.5 Gm. of 3,3'-dinitro-4,4'-dihydroxy diphenyl dimethyl methane was dissolved in 250 cc. of alcohol and the solution stirred under a reflux condenser. A solution of 19 Gm. of mercuric acetate in 100 cc. water and 5 cc. glacial acetic acid was then added and the mixture refluxed and stirred for 18 hours until a side test showed absence of ionic mercury. The precipitate was then filtered off, washed with alcohol and ether and dried. The product formed a bright yellow powder insoluble in alcohol and the common organic solvents but soluble in alkali hydroxide solutions to yield fluorescent brown solutions.

Yield, 17.0 Gm.

0.1995 Gm. gave 0.0948 Gm. Hg.

Hg found, 47.5%

Calculated for $C_{16}H_{18}N_2O_{10}Hg$, 48.1%

3,3'-Dibromo-4,4'-Dihydroxy 5,5'-Diacetoxy Mercuri Diphenyl Dimethyl Methane—28 Gm. 4,4'-dihydroxy diphenyl methane was dissolved in 250 cc. glacial acetic acid and 40 Gm. bromine added dropwise with good stirring. The solution was then allowed to stand fifteen minutes and

poured into 1500 cc of water. The sticky precipitate was washed free of acid with water and mercurated without further purification, because attempts to crystallize this substance led to decomposition with the formation of red coloring matters.

The hot solution of 23 Gm mercuric acetate in 100 cc of water and 5 cc glacial acetic acid was added to a refluxing solution of 11 Gm crude 3,3'-dibromo-4,4' dihydroxydiphenyl dimethylmethane with continuous stirring. About fifteen minutes were required for the addition of the mercuric acetate solution. A white precipitate commenced to form during the addition of the mercuric acetate and continued for about 45 minutes. At the end of this time inorganic mercury could no longer be detected in the solution. The latter was cooled and the heavy white precipitate collected by filtration, washed with ether and dried.

Yield, 18 Gm

M p—decomposes 250° C

0.1704 Gm gave 0.0775 Gm Hg

Hg found, 44.5%

Calculated for $C_{16}H_{18}O_6Br_2Hg_2$, 44.5%

The product formed a white amorphous powder, insoluble in the common organic solvents but soluble in a considerable excess of alkali hydroxide solution.

The mercury analyses reported here were carried out by the Whitmore gold crucible method.

The biological tests on compounds reported herein were made in the Biological Research Laboratories of E. R. Squibb and Sons and we gratefully acknowledge their assistance.

VEGETABLE EXTRACTS AND BLOOD-SUGAR *

BY PAUL S. JORGENSEN AND E. V. LYNN

Just after the discovery of insulin Collip (1) prepared from various vegetables, as well as from animal tissue, extracts which were capable of producing hypoglycemia in animals. The effects differed from those by insulin in requiring a comparatively long period before their appearance. A further very interesting observation he made was that the serum or defibrinated blood of an animal, made hypoglycemic by insulin, by the plant extracts, by chemicals, by starvation or by pancreatectomy, had similar marked lowering effect on the sugar in another animal and could even cause death. The decrease in sugar and toxicity could thus be transmitted from one individual to another, apparently without limit.

Thalkimer and Perry (2), in a very limited study, reported an insulin-like action by injection of raw potato juice. Winter and Smith (3) noted similar results from extracts of yeast. Others (4) have partly confirmed or directly contradicted this testimony.

In 1927 Allen (5) described the action of myrtomel (earlier called myrtillin), an extract made from leaves of the genus *Vaccinium* by a process similar to that for

* Seattle, Washington June 20 1934

isolating insulin. It had no effect on the sugar in normal, fasting animals but reduced or completely suppressed the hyperglycemia following the administration of large quantities of dextrose to dogs and men and diminished the glycemia and glycosuria from epinephrine. The most striking characteristic was an apparent storage, since the effects lasted several weeks after a single dose of 1 Gm. Larger amounts did not increase this effect and were entirely non-toxic, as was also continual administration over long periods. Furthermore, the blood-sugar of totally depancreatized dogs was stabilized by ingestion of myrtomel and the span of life was increased four to five weeks.

Clinical experience, which was at that time much less striking, has not been particularly encouraging. Of 81 diabetic patients, Allen found that 36 were benefited and in 6 it was possible to stop the use of insulin entirely (18 to 54 units daily). More recently he came to the conclusion that there is no definite insulin-replacing effect. Myrtomel was afterward placed on the market for experimental purposes, but its subsequent withdrawal and abandonment would seem to indicate that others could not get satisfactory results in diabetes.

Others have attributed similar properties to extracts of various plants: grapefruit by Taylor and Atter (6), later refuted (7), fragrant sumac and bugleweed (8), alfalfa, clover, corn silk, etc. (9), species of *Vinca* (10). Poole, in an unpublished work here, found similar results from extracts of *Gaultheria shallon* (salal), of *Vaccinium ovalum* and of *V. parvifolium*.

We started the present investigation to determine the nature of the substance responsible for this power to reduce the amount of sugar in the blood.

EXPERIMENTAL

Rabbits, which were used as test animals, were kept on a standard diet which was satisfactorily adequate and under conditions as nearly ideal as possible. The withdrawal of blood for analysis was made at fixed times of day and under equal conditions otherwise.

After a large number of trials, it was found that the normal amount of sugar in the blood could be placed approximately at 0.109 ± 0.009 per cent using the Shaffer-Hartmann method of determination (11). In a similar series of experiments it was found that 0.5 mg. of epinephrine gave about 0.176 per cent sugar in 90 minutes and 0.196 in 120 minutes, while 1 mg. of epinephrine gave 0.278 and 0.294 per cent respectively, in the same times.

An extract was made from the leaves of salal by Allen's method and fed to rabbits in a dose of 1 Gm. daily (equivalent to 50 Gm. of leaves) for several days. No effect could be observed on the level of blood sugar nor on epinephrine hyperglycemia which was produced every day during the experiment. Subcutaneous injections of the extract, equivalent to 60 Gm. of the leaves, were likewise without effect, as were also injections of fractions made by dialysis and of aqueous and alcoholic extracts of the leaves. In no case could active material be found.

Similar negative results were found with *Vaccinium ovalum*. In no instance could any extract or fraction be found to alter the normal level of blood sugar or that after action of epinephrine. We are convinced after hundreds of experiments that the solutions made in various ways have no power to reduce the amount of sugar.

In view of the circumstances it seemed advisable to repeat some of the work on myrtomel. Allen (5) described preparations from two species of *Vaccinium* but the myrtomel later used by experimenters came from an unknown source and according to the manufacturers the species used is immaterial. Consequently, a sample of leaves from *V. dumosum* was obtained from near Sudbury, Massachusetts, extracted and tested on rabbits. Again results were entirely negative since orally or by injections no effect on blood sugar, either normal or after epinephrine, could be obtained by amounts equal to 50 Gm. of leaves.

At this stage the problem began to take on a different light and we were forced to consider

it from the negative viewpoint. Possibly such preparations from plants do not have an effect on sugar metabolism, in spite of reports to the contrary. With this in mind, it was decided to repeat the earlier work of Collip (1).

An alcoholic extract was made from green onion tops and concentrated according to his method. This was injected daily as before in amount equal to 20 Gm. of original material. There was made also an aqueous extract from the onion tops and injected in the same amount. Although many such tests were performed, we could never note any change in the normal amount of sugar nor in the level after injection of epinephrine.

Exactly similar results were obtained with fresh lettuce leaves (25 Gm. daily) and with fresh cabbage leaves (20 Gm. daily). In all cases the methods of preparing the extracts were according to Collip.

In order to make the matter still more convincing, we tested some of these preparations on a depancreatized dog. The animal lived for more than five days, during which time there were injected at various periods extracts equivalent to 100 Gm. of huckleberry leaves, to 100 Gm. of salal leaves and to 60 Gm. of fresh lettuce leaves. In no case was the curve of blood sugar altered. Insulin was capable of lowering the amount of sugar but could not prevent death in coma on the sixth day.

The interesting observation by Collip that hypoglycemia could be transmitted from one animal to another next engaged our attention. He found that, if a rabbit was rendered low in blood sugar by insulin, by plant extracts, by guanidine derivatives or by starvation, injection of its serum or defibrinated blood would confer a similar condition on a second animal.

An attempt was made to confirm this for insulin. A rabbit, given 20 units of the latter by injection, was in a state of violent convulsions three hours later. While in this condition it was bled and the blood was defibrinated by whipping. A second rabbit was injected with 10 cc. of this product and then observed for more than a week. The amount of sugar in the blood was normal at all times and it exhibited no unusual symptoms. Several repetitions of this experiment gave the same result.

DISCUSSION

From a study of the results herein contained and those of previous experimenters, we are forced to conclude that the reputed therapeutic value of plant extracts in the control of sugar is erroneous.

Collip's work may be criticized from the standpoint of the quantity of liquid injected and of the five days of starvation. He reports the injection of 50 to 90 cc., which would probably dilute the blood considerably and also cause a shock to derange the general metabolism. Furthermore, he observed a reduction in sugar in the case of some extracts but was often unable to get a similar result with the same materials in other animals. It appears that the effects obtained were due to the condition of the subject rather than to a specific constituent of the extract. If there was such a constituent, consistent results should be obtained. In the earlier work on insulin an active extract invariably exerted its effect on all animals within six hours. Some of Collip's extracts did not develop a subnormal blood-sugar until five days after injection and, since food was withheld entirely during the course of the experiment, it is obvious that the reduction in sugar was due to starvation.

Thakimer and Perry (2) noted from 5 cc. of raw potato juice intravenously a reduction of sugar from 0.17 down to 0.13 per cent. They did not state the method of determination but it is evidently one capable of considerable error, or the amount found for normal would not be so high. One experiment only was reported and it would seem inadvisable to draw any exact conclusion therefrom.

Winter and Smith (3) used extracts of yeast from various sources. Of 17 experiments reported, only 3 showed lower than normal amount of blood-sugar and an attempt to repeat one of these resulted in failure.

In view of these facts, our own experiments and a careful survey of other literature, it seems to us entirely reasonable to question the existence of any evidence that plants contain a substance which will alter amounts of sugar in the blood

SUMMARY

No evidence could be found for the reputed activity of plant extracts in reducing normal or high blood-sugar. Also no evidence could be found for any transference of hypoglycemia from one animal to another.

SUGGESTIONS FOR THE IMPROVEMENT OF PROFESSIONAL RELATIONS BETWEEN DENTISTS AND PHARMACISTS *

BY C L WHITMAN, D D S

The professions of Dentistry and Pharmacy have been very closely related since their beginning. It is my purpose to point out some of the reasons for and method by which the pharmacists and dentists may cooperate to their mutual advantage.

In the United States there are about 67,000 dentists, all of whom prescribe drugs to a certain extent. But as a rule, while drugs are used often they are not prescribed as effectively or skilfully as they might be. I do not mean to condemn the dental profession as a whole, but this condition exists more frequently than it should. Dentistry has been practised for centuries but not as we know it to day, modern dentistry, as a distinct and separate profession, was born in 1839 when the Baltimore College of Dental Surgery, the first dental school in the world, was established in Baltimore. Dentistry and medicine were from that year practically divorced and while dentistry, in its early days, depended largely on medicine for its development, its fundamental studies are at present based on biology, exactly as is medicine or any other branch of the healing art. Before this first dental college was established few specific books on dental therapeutics existed, the little knowledge concerning the action of drugs was scattered through the few dental works which existed at that time, or was closely guarded by its possessors. Since then dentistry has rapidly forged ahead—great strides have been made and dentistry is continuing to progress.

* Section on Education and Legislation, A P H A, Washington meeting, 1934

As the profession of dentistry has advanced and become more of a factor in the healing art, it has been increasingly exploited by many unscrupulous manufacturers, preparations, concerning which little or nothing is stated as to their formulas, are being constantly brought to the dentist's attention. This condition, I believe, is in a great measure unconsciously encouraged by the dentist because much of his prescribing is done by word of mouth. This is due in part to inadequate training in this particular subject in the dental schools and by the constant pressure upon the dentist through detail men and the advertising of preparations concerning which little or nothing concerning their make-up is stated. The American Dental Association is not unaware of this condition and accordingly it has established a Council on Dental Therapeutics. The purpose of this Council is to acquaint the profession with preparations and drugs which are of use to dentistry and also to expose those preparations which are useless or unacceptable. The results of their findings are reported each month in the *Journal of the American Dental Association*. These findings will be compiled in a book similar to the N N R of the American Medical Association and represent a great forward stride in dental therapeutics.

One of the ways in which pharmacy and dentistry can work together is through personal contact of individuals of both professions. The pharmacists who are conducting the pharmacies may suggest to dentists with whom they are acquainted ways in which they may prescribe drugs to better advantage. Dentists, on the whole, are eager for information, to cite a concrete example of just what I mean—let us take sodium perborate, which is one of the drugs a dentist might wish to prescribe. Five years ago he prescribed it and expected a patient to buy and use it. Nowadays a patient knows what sodium perborate is and he will substitute some flavored and colored perborate put up under a trade name, because he knows what the official perborate is, and that it tastes bad. Manufacturers, quick to see this, retail the drug under various names and flavors. Pharmacists might suggest to the dentist that he add color and an essential oil to flavor the preparation. The psychological action of the prescription would then be retained and, after all, this is one of the most important actions of a drug.

This may sound very simple to pharmacists but that is your profession. You know how to handle coloring materials, flavors and vehicles and know how to prepare drugs in some more palatable and pleasing form. You are experienced in the use of these things but the average dentist, at best, has probably only read of them.

In most dental schools a practical working knowledge of these drugs is not given, the students read of them in books. They may see the drugs, but they do not have the opportunity to prepare and combine drugs as in the preparation of a prescription. Because of this, the dentist lacks confidence in writing prescriptions and encouragement or suggestions from the pharmacist to the dentist would be of mutual benefit.

Another phase in the relationship between pharmacists and dentists would be in the field of laboratory diagnosis, there is an increasing demand for pharmacists who are trained and equipped to do this work. As dentistry is becoming more of a "preventive" science there is greater necessity for dentists to have a better knowledge of the patient's general physical condition, hence, the need for laboratory tests will become greater in the coming years. In advocating this, I do not mean in any way to infringe upon the practice of medicine, but I do feel that there is much that

can be done, which will not necessitate the physician's viewpoint. To cite an example of this. In the case of gingival necrosis, commonly known as pyorrhea, with a knowledge of the blood sugar it would be possible for a dentist, before undertaking any treatment, to know whether he would obtain a favorable result. By having a white count and a granulocyte count it would be a very simple matter to differentiate between a Vincent's infection and granulocytosis, without the blood count it means a great loss of time, which could be prevented and much error in diagnosis eliminated.

This brings up another means by which the professions may cooperate. As dentistry is conscious of its weakness in this phase of its work it has taken steps to correct it by the establishment of the Council on Dental Therapeutics. Because of the work of this Council and the interest aroused the dental colleges are giving and will, in the future, give this subject more prominence in their curricula. In the meantime there are many graduate dentists who would like to know more about the subject and postgraduate classes should be encouraged. These classes would, in my opinion, be of great value and could be sponsored by pharmacy and dental schools. I refer at this time to a course for dentists that was promoted by Prof. George C. Schueck of the New Jersey College of Pharmacy of Rutgers University. This was probably the first time such an effort has been made. This course consisted of six lectures and was attended by about thirty-five dentists. The course was devoted to dental drugs and a part of the course to the enlightenment of dentists as to what is being used in proprietary drugs. Needless to say the course was enthusiastically received. I do not mean to imply that schools of pharmacy should gratuitously establish such courses for dentists. However, there are men in the profession of pharmacy who are better fitted to teach the subject—it is their vocation and because of their general knowledge of pharmacology they may be able to suggest more efficient and effective drugs than those being used. If such men could be made available to dental societies and study groups much good could be accomplished.

Finally, I would earnestly urge that the study of your vocation never cease and that you continuously strive for improvement. A few days ago my attention was directed to a survey in the state of Michigan as a foundation to formulate a plan for socialized medicine, *i. e.*, all the divisions of public health service. In this survey it was determined that that time out of school had its influence on the individual's knowledge. This was discovered as a result of examinations consisting of questions that the average practitioner should be able to answer, it was found that the longer the average man had been out of school, the less he knew. While much is being done in the way of postgraduate work, journalism, study groups and conventions, the unfortunate part is that the man who needs this help most is the one who does not take advantage of the opportunities offered.

The author of the paper interspersed the discussion by references to the value of individual and group contact, establishment of laboratories and improvement of general knowledge.

The 30th annual meeting of the American Association of Museums will be held in Washington, D. C., headquarters at the Smithsonian Institution, May 23-25, 1935.

The AMERICAN PHARMACEUTICAL ASSOCIATION is listed among the Museums in Washington.

THE SUCCESSFUL APPLICATION OF U S P AND N F PUBLICITY IN A
RETAIL PHARMACY *BY LAWRENCE S WILLIAMS ¹

In opening his presentation the author expressed his regret that he did not promote professional pharmacy earlier. He spoke of a number of clippings from various publications, among them one by Samuel C. Davis, read before Tennessee Pharmaceutical Association, on the value and importance of manufacturing U S P and N F preparations by retail pharmacists in the saving of costs and establishing professional relations with the doctors. Another paper, by C. O. Bigelow, was referred to, the latter had presented fifty copies of the Pharmacopœia to physicians and of these forty-nine thanked the donor, one inquired relative to the purpose of the Pharmacopœia. Another paper was by H. A. B. Dunning on the glycerophosphate preparations, all of these were referred to by the author as they awakened in him the desire to practice pharmacy more extensively and establish a prescription practice. It was this effort which enabled him to carry on.

Mr. Williams referred to the publicity of Maryland pharmacists among physicians and stated that this was producing results. He presented for consideration and thought that pharmacists should attend hospital conferences, get acquainted with the interns and medical staff, attend meetings of medical societies, pharmaceutical meetings, displays should be made at meetings and cooperative efforts should be promoted.

The author discussed the publicity developed by him, letters addressed to physicians were addressed by pen, not by rubber stamp. Among the preparations with which physicians were detailed included, "Infusion of Digitalis," "Basham's Mixture," "Stokes Expectorant," etc. Prior to the opening of the schools, he prepared a special letter on "Vaccine Virus" and while many obtained this from the Health Department, he sold well over two hundred packages each year.

The substance of a letter addressed to doctors by Mr. Williams on "Service" is included.

' DEAR DOCTOR

"In solicitation of your patronage I submit a service, planned to meet the requirements of modern pharmacy in its relations with the medical profession

' A service which does not usurp the prerogatives of the physician,

"A service which combines adequate equipment and efficient management designed to carry out your directions,

"A service which furnishes the highest quality of prescription chemicals,

"A service which regards your patient as a sacred trust,

A service which insures prompt delivery of your orders,

"A service at reasonable prices, which upon your recommendation will be adjusted to meet special circumstances of your patient,

' A service which invites your inspection "

A card, with address and phone number, addressed to prospective patrons of the section of Baltimore in which the pharmacy is located follows

* Section on Practical Pharmacy and Dispensing. A. Ph. A. Washington meeting 1935.
Abstracted

¹ Deceased

' THE PHARMACIST'S CREED "

I have given years of my life to study and training
 I fill your needs day and night at times without profit—at times without
 pay
 ' I offer many courtesies and helps not known of except in pharmacies
 ' I am accurate conscientious and capable in compounding your prescriptions
 ' I aid your physician in every way possible
 ' I endeavor to earn the trust that you and your physician place in me
 I am
 (Signed) Your Pharmacist,
 L S WILLIAMS "

The author explained other means of publicity adopted and used by him and, in closing, stressed the importance of cooperation

A PHARMACEUTICAL STUDY OF p_H *BY FREDERICK F. JOHNSON ¹FORMULATION OF p_H

Applying the law of mass action to an acid, HA, which ionizes according to the equation $HA \rightleftharpoons [H^+] + [A^-]$, we find that an equilibrium exists according to the equation

$$\frac{[H^+][A^-]}{[HA]} = K_a,$$

in which K_a = the dissociation constant of the acid. The dissociation constant of a base is given by the corresponding equation

Water dissociates to an extremely small extent according to the equation $H_2O \rightleftharpoons [H^+] + [OH^-]$. Applying the law of mass action to this dissociation, we obtain

$$\frac{[H^+][OH^-]}{[H_2O]} = K_w$$

The concentrations of H^+ and OH^- in pure water or in dilute aqueous solutions are so small compared with the concentration of undissociated water molecules, that the concentration of the latter, $[H_2O]$, may be considered as constant during the dissociation. The equation then becomes $[H^+] \times [OH^-] = K_w$. The value of K_w at 25° C has been found to be 1.0×10^{-14} (5), (6) (7), (8), (21), (31). In pure water, the concentrations of the H^+ ions and the OH^- ions must remain equal. Therefore,

$$[H^+] \times [OH^-] = [H^+]^2 = [OH^-]^2 = 1 \times 10^{-14}$$

Then, $[H^+] = [OH^-] = \sqrt{1 \times 10^{-14}} = 1 \times 10^{-7}$. This equation means that pure water or a neutral aqueous solution at 25° C contains 1×10^{-7} moles of H^+ ions and 1×10^{-7} moles of OH^- ions per liter and is a 1/10,000,000 normal solution of both H^+ and OH^- ions.

For practical reasons, hydrogen ion concentrations are expressed as the logarithms of their reciprocals. A common logarithm is an exponent to the base 10. Thus the symbol p_H signifies "hydrogen exponent." The definition of p_H may be given mathematically

$$p_H = -\log [H^+] = \log \frac{1}{[H^+]}$$

Since the hydrogen ion concentration varies in a definite reciprocal manner with hydroxyl ion concentration, the p_H scale may be used to express degrees of alkalinity as well as degrees of acidity, as in the following synopsis.

From this data it is seen that, while the p_H values vary according to arithmetic progression, the corresponding hydrogen ion concentrations vary according to geometric progression.

Acidity	Concentration of H or OH Ions	Alkalinity
p_H 7 (neutral)	$N/10,000,000$	p_H 7 (neutral)
p_H 6	$N/1,000,000$	p_H 8
p_H 5	$N/100,000$	p_H 9
p_H 4	$N/10,000$	p_H 10
p_H 3	$N/1,000$	p_H 11
p_H 2	$N/100$	p_H 12
p_H 1	$N/10$	p_H 13
p_H 0	$N/1$	p_H 14

* From the University of Washington College of Pharmacy. A thesis submitted as part requirement for the degree of Master of Science in Pharmacy under the direction of H. A. Langenhahn.

¹ Fairchild fellow for 1934-1935.

FORMULATION OF BUFFER CAPACITY

It would be of little value to discuss in this paper the action of buffers, however, since there are many references in the pharmaceutical literature to a very valuable formulation of buffer effect, this one expression will be explained here. Van Slyke (53) has adopted a unit for the buffer capacity of solutions. This unit is the differential ratio $\frac{dB}{d(p_{H})}$ expressing the relationship between the increment (in gram equivalents per liter) of a strong base B added to a buffered solution and the resultant increment in p_{H} . An increment of strong acid is equivalent to a negative increment of base, or $-dB$. In these terms, a solution has a buffer capacity of 1 when a liter will take up 1-Gm equivalent of strong acid or alkali per unit change in p_{H} . If a base is added the p_{H} is increased, so that both dB and $d(p_{H})$ are positive. If acid is added, both dB and $d(p_{H})$ are negative. The ratio $\frac{dB}{d(p_{H})}$ is therefore, always a positive numerical value. This is called Van Slyke's ratio and is often designated by B . When this ratio is applied, for instance, to tinctures and fluids, extracts, and when the buffer capacity is plotted with the quantities of acid as ordinates and the corresponding increments in p_{H} as abscissa, the curve is usually a straight line within reasonable limits. From such a graph we obtain the ratio $\frac{\Delta B}{\Delta(p_{H})}$ where each of these values is a measurable increment. Within the limits of the straight line curve, the buffer capacity obtained using the measurable increments is identical with that of the differential ratio $\frac{dB}{d(p_{H})}$. Van Slyke's ratio is much used in adjusting pharmaceutical preparations to specified p_{H} values.

FORMULATION OF ELECTRODE POTENTIALS

The most direct formulation of an electrode potential is as follows. If a metal is put in pure water, some of the metal dissolves forming positively charged ions, and consequently, the remaining metal assumes a negative charge. Three principal forces are present—the solution pressure of the metal, the electrostatic force of the charged ions, and the osmotic pressure of the solution. An equilibrium of the forces is soon reached. Assume an electrode, such that 1 Gm mole of ions of charge n , carrying nF faradays of electricity (a faraday is the number of coulombs carried by a gram equivalent of an ion) pass from the electrode to the solution, increasing the partial osmotic pressure by dp . Thus n is equivalent to the valence of the metallic ions. The change in potential difference between the electrode and the solution will be dE . The electrical work expended will be $nFdE$ and the work taken up by the system will be Vdp . Therefore, $nFdE = Vdp$.

According to the laws of an ideal gas $V = \frac{RT}{p}$ in which p = pressure in atmospheres, V = volume in liters, R = the gas constant and T = the absolute temperature. Thus by eliminating V , $dE = \frac{RT}{nF} \frac{dp}{p}$. Integrating gives $E = \frac{RT}{nF} \log_e p + c$, where \log_e is the natural logarithm to the base e and c is some integration constant. In dilute solutions, p is equivalent to the activity of the ions. By introducing known values for R and F ($R = 8315$ international joules and $F = 96500$ coulombs) and, by transposing the natural logarithm into the common logarithm by multiplying by 2.3026, $E = 0.0001984 \frac{T}{n} \log_{10} c_{ion} + C$. Thus at $25^{\circ}C$ $E = \frac{0.0591}{n} \log_{10} c_{ion} + C$. C may be eliminated by equating E against e_0 (normal potential of the metal that is the difference in potential between it and the normal hydrogen electrode in a solution whose ion activity is equal to 1). The normal hydrogen electrode is defined by international agreement according to the following specifications:

"The potential at a hydrogen electrode under one atmosphere pressure of hydrogen in a solution of unit hydrogen activity shall be considered zero at all temperatures."

By eliminating the integration constant C , we arrive at the fundamental equation for converting electrode potentials to hydrogen ion concentrations $E = e_0 + \frac{0.0591}{n} \log_{10} c_{\text{H}^+} \text{ ion } (25^\circ \text{C})$

HISTORY OF METHODS

The electrolytic dissociation theory of Arrhenius (2) and the application of the law of mass action to ionic equilibria marked the beginning of hydrogen-ion control. The dissociation constant of water was determined in various ways by Ostwald (5) Wjys (6) Nernst (7) Kohlrausch and Heydweiller (8), Sorensen (21) and Lewis, Brighton and Sebastian (31). These steps furnished the basis for the mathematical conception of hydrogen ion concentration. Sorensen (21) suggested that the numerical values of the negative exponents of hydrogen ion concentration values he adopted as the basis of an acidity scale and recommended the symbol P_{H^+} . Clark (110) introduced the simpler symbol p_{H} , which is now used more extensively.

Pertaining to the potentiometric method of determining p_{H} Nernst (3) Peters (10) and Crotofino (12), using the ideal gas laws (59) and Faraday's laws of electrolysis have shown the logical derivation of a common expression for all electrode potentials. The hydrogen electrode was first used by Bugarszky and Liehermann (9) who applied it to a biochemical problem. Later, a thorough treatise on the hydrogen electrode was published by Hildebrand (25). The calomel electrode was developed through the early efforts of G. N. Lewis and his colleagues (20), (31), (59). Our fundamental information regarding the quinhydrone electrode is largely due to Builmann (39), (40), (56). The development of the glass electrode dates back to Helmholtz (1), who, in 1881 first constructed a glass electrode. The further development of this electrode was carried on by Haber and Klemensiewicz (19) and Kerridge (76).

The first survey of indicators suitable for hydrogen ion determinations was performed in Nernst's laboratory in 1904 by Salessky (15). The results of this and many other surveys were summarized in Salm's famous table (16). Then came the classic work of Sorensen (21) in which he eliminated a vast number of faulty indicators and organized a series of indicators suitable for biological work. Clark and Lubs (29) also selected a series of indicators which was composed mostly of sulphonphthaleins.

HYDROGEN ION CATALYSIS

Most drugs can be classified into two groups on the basis of optimum p_{H} stability: those having maximum stability at $p_{\text{H}} 7$ and those having maximum stability very near $p_{\text{H}} 5$. This suggests two distinct factors affecting the relation between hydrogen ion concentration and stability of drugs. Stability in the absence of acidity or alkalinity is easily understood, but stability at $p_{\text{H}} 5$ must be explained on the basis of hydrogen ion catalysis.

The majority of reactions in solution appear to be catalyzed by hydrogen ions and hydroxyl ions. The experiments of Arrhenius (4) on the inversion of sucrose by weak acids in the presence of the corresponding salt gave results which showed that the catalytic activity of acids in aqueous solution is approximately proportional to the degree of dissociation as determined by electrolytic measurements. Later Arrhenius (11) found that the rate of inversion of sucrose by weak acids was greatly augmented by the addition of the neutral salts of strong acids, for example KCl increased the catalytic activity of CH_3COOH . Arrhenius, therefore postulated that dissolved salts increase the dissociation constants of weak acids in solution. (Takeuchi and Horikoshi (295) have recently shown that while KCl and NaCl increase the rate of sucrose inversion by acids, K_2SO_4 and Na_2SO_4 decrease the rate of inversion.) In 1900 Euler (13) proposed a theory describing the catalytic effect of hydrogen ions and hydroxyl ions as an instantaneous salt formation. This conformed to the view commonly held (but certainly not justified) that ionic reactions are more rapid than reactions between electrically neutral molecules. In 1913, Stieglitz (26) proposed a theory agreeing with that of Euler.

The view that the catalytic effect represents the result of two simultaneous changes involving a hydration of the hydrogen ion and a change in the non-ionized acid was developed by a number of workers (17) (18) (22) (24), (27). This became known as the dual theory of acid catalysis and served as the first conception of the addition products formed between hydrogen ions and other substances. Kendall (43) developed this theory and postulated that the number of catalytically active particles is much greater than is ordinarily supposed. He recognized several

types of hydrogen ions, such as H^+ , $[H_2O]^+$, $[HCH_2COOCH_3]^+$, $[HClHO]$, $[HCHCOOH]^+$, etc., existing in a complex series of equilibria and each possessing a different catalytic activity. Rice (61), in 1923, recognized such equilibria and ascribed the catalytic effect of hydrogen ions to the free ions and correspondingly to the free or unhydrated hydroxyl ions. This leads to the conclusion that stoichiometrically neutral water is distinctly alkaline catalytically, and it is not until the hydrogen ion concentration has a value of about $p_H 5$ that the concentrations of the unhydrated ions become equal and the catalytic activity is at a minimum.

The views which are most in vogue today were put forward by Bronsted (109), in 1928. Bronsted first contended that the law of mass action cannot be applied in its classical form to ionic reactions. He developed a new mathematical conception of hydrogen ion catalysis and a new definition of acids and bases. The new definition is represented by

The mechanism of hydrogen ion catalysis can then be visualized as being a transfer of a proton from catalyst to substrate (acid catalysis) or from substrate to catalyst (basic catalysis). The success of Bronsted's hypothesis consists in its ability to predict the changes in reaction velocity due to the addition of other molecules and ions by calculating the change in concentration of the complex between the reacting substances. Bronsted's work has been verified by later investigators.

The existence of various hydrogen ion complexes is associated with the so-called "activities" of hydrogen ions. The term hydrogen-ion activity, will be returned in this thesis.

Olivier and his co-workers (321), (322), (323) have recently published data concerning the relation of the nature of the substrate to its sensitiveness to hydrogen ion and hydroxyl ion catalysis.

EFFECT OF ELECTROLYTES ON p_H

Electrolytes have considerable influence upon both the p_H and the stability of solutions. The fundamental effect of electrolytes is by no means understood. Some of the most valuable data concerning the effects of electrolytes will be cited.

Thomas and Baldwin (34) claimed that electrolytes increase the acidity of acid solutions in the following order: $MgCl > LiCl > NaCl > KCl = NH_4Cl > BaCl_2 > MgSO_4 > Na_2SO_4 > (NH_4)_2SO_4$. The sulphates decrease the acidity. Lepper and Martin (87) stated that the influence upon p_H of the cations of univalent alkali metals varies inversely as their atomic weights. They found that NaCl reduces p_H and reduces the activity of anions which results in an increased dissociation of any acids which are present. To account for their results they assumed that NaCl increases the dielectric constant of water. Loeb (33) advanced a theory which assumes that neutral salts with univalent or bivalent cations assume a charge which is negative with reference to that of water particles and that neutral or acid salts with trivalent or tetravalent cations assume a charge which is positive with reference to that of water particles. Taft and Malm (228) found that in alkaline gum arabic solutions the presence of neutral salts increases the p_H values. Northrop (45) found that neutral salts decrease the p_H of acid gelatin and increase the rate of its hydrolysis. Britton and Dodd (257) found that NaCl in a concentration as high as tenth normal does not affect the p_H of alkaline sodium hypochlorite solution. Taketomi and Horikoshi (295) stated that the rate of inversion of sugar by acids is increased by NaCl and KCl, but is decreased by Na_2SO_4 and K_2SO_4 . Schmidt (176) claimed with regard to the flocculation of diphtheria toxin and antitoxin, that there is a range of electrolyte concentration in which no flocculation occurs. Above or below this range flocculation does occur.

PHYSIOLOGICAL p_H

Reaction of Distilled Water—It is well known that distilled water of $p_H 7.0$ is seldom obtained. Water is considerably acid after one distillation and soon becomes alkaline during storage in ordinary glass. Acee and Fawcett (142) found that the solids and carbon dioxide in once distilled waters gave them p_H values of about 5.0–5.5. Only by repeated distillations in tin apparatus and in filtered and carbon dioxide free air can water be obtained of p_H about 6.9. By this method the authors obtained their so-called "super pure water" having a specific conductivity

of 0.04×10^{-3} at 18°C Acree and Fawcett included tables which showed the errors in p_{H} caused by the dilution of buffers with ordinary p_{H} 5.0 distilled water and with p_{H} 5.7 air carbon dioxide equilibrium water. Williams and Swett (55) obtained fresh, distilled water of p_{H} 6.8 after 48 hours in contact with air the p_{H} became 5.23. Stock glucose solutions had a p_{H} of less than 5.0. Bruck (193) has observed the change in p_{H} during storage of water not in contact with air. Freshly distilled samples had a p_{H} of 5.65, when stored in ordinary corked glass the p_{H} reached 9.00 in 20 days. After standing 12 days more exposed to the air, the p_{H} was 7.80. Freshly distilled water was sterilized in Hageda ampuls and, in 5 weeks, the p_{H} changed from 5.55 to 7.5–8.0. Distilled water was placed in corked flasks of Jena glass and, within 4 weeks, the p_{H} remained between 5.4 and 5.5. Mattheus (217) reported that water which was sterilized and stored in washed Jena ampuls for 2 years increased in p_{H} from 6.2 to 6.4–7.0, and increased in total solids by 0.0048 Gm per liter. Klobusitzky (273) has devised a method for testing glass ampuls to determine if their reactions are suitable.

Adjustment to Blood p_{H} —Human blood has a p_{H} range from 7.3 to 7.5, being fairly constant at p_{H} 7.4. p_{H} values for blood or tissues above or below these figures are not compatible with life. A patient becomes comatose if a p_{H} of 7.1 is reached or convulsive with a blood p_{H} above 7.5. Jacobs and Parpart (210) reported that hemolysis by hypotonic solutions was measurably increased by p_{H} changes of as little as 0.01 unit. It is important, therefore, that the p_{H} of solutions for injection be as close as possible to 7.4 and that the p_{H} values of these solutions remain stable during sterilization.

Physiological salt solution, when prepared with ordinary distilled water, has been found by Williams and Swett (54) to be dangerously acid. Fleisch (49) has criticized Ringer's and Tyrode's solutions, claiming the first to be too acid and the other too alkaline. He reported the following method for preparing a stable sterilizable nutritive solution of physiological p_{H} . To 10.5 Gm NaCl, 0.5 Gm KCl, 0.3 Gm CaCl_2 , 0.1 Gm MgCl_2 and 5 cc $\text{N H}_2\text{PO}_4$, add H_2O q. s. to 58.7 cc. Filter, add 50 cc of this to 1 liter of water and sterilize. Then saturate with oxygen and add 5 cc of sterile N Na CO_3 . Hansen, Schou and Tonnesen (268) found that invert sugar solutions have a p_{H} of about 3.0 when the inversion occurs during sterilization in sealed ampuls. Williams and Swett (54) reported that 10% glucose solutions of p_{H} 8.58 became as acid as p_{H} 4.9 when boiled or autoclaved. In a later publication (55), they stated that when these solutions were buffered to a p_{H} of 7.4 with KH_2PO_4 and K HPO_4 , there were no unpleasant reactions following their free use.

In the same article they reported the p_{H} values of various sterilized commercial solutions. They found that a sodium citrate solution used in a transfusion where a violent reaction followed had a p_{H} of 10.25. Solutions of dyes for intravenous and intramuscular injection had a p_{H} of 5.0. When properly buffered 10–40% more of these dyes were excreted. Solutions of arsenphenamine, tetanus antitoxin and antipneumococcus serum were all too alkaline.

The sterilization of cocaine hydrochloride is always accompanied by increased acidity. Roy (78) reported p_{H} values of cocaine hydrochloride solutions, as follows: 1% solution, 5.20; 2% solution, 4.50; 3% solution, 3.75. The p_{H} of the 1% solution, sterilized for 30 minutes at 100°C , became 4.60. Regnier and David (285), (286) observed the p_{H} change of cocaine hydrochloride solutions during and after sterilization. The p_{H} values dropped from 5.9–6.0 to as low as 3.4 after 80 days' storage following sterilization. The authors pointed out the dangers of the pharmacological use of such acid solutions. In a later publication (287) the authors found that when the cocaine hydrochloride is buffered to a weakly acid reaction by Na_2CO_3 and NaH_2PO_4 , or NaH_2PO_4 and Na_2HPO_4 , the p_{H} remains stable during sterilization.

Dietzel and Huss (111) have found that alkaline or soluble glass causes considerable p_{H} change during the sterilization of morphine hydrochloride solutions. The instability caused by the hydroxyl ions was found to be catalytical. They recommended the use of Jena or quartz glass. Roy (78) found that novocaine solutions become dangerously acid (p_{H} 4.2–4.3) during sterilization. Later Rae (223) suggested that the only safe way of sterilizing novocaine solutions is by filtering through a Chamberland filter fitted with Jena glass. Goldberg (266) stated that the p_{H} of procaine hydrochloride mixed with epinephrine can be stabilized between p_{H} 5.7 and neutrality by a water solution of Na_2HPO_4 and NaH_2PO_4 .

Roy (78) claimed that the hydrogen ion concentrations of all hydrochlorides of amine alcohols increase considerably during sterilization, producing small quantities of benzoic acid

Besides cocaine and novocaine, he considered in his article stovaine and atropine sulphate. During sterilization the pH of stovaine dropped from 5.40 to 4.0 and that of atropine sulphate changed from 6.45 to 5.70. Macht and Shohl (37) have noted that benzyl alcohol solutions when sterilized or stored in soft glass containers, become dangerously alkaline and deteriorate rapidly. They recommended that the solutions be highly buffered to pH 7.0-6.8 and sealed in hard glass containers.

Levy and Cullen (36) found that strophanthin solutions when autoclaved in commercial glass ampuls, changed in reaction from pH 6.0 to pH 9.0. They reported that solutions of strophanthin in 0.02 molar phosphate solution adjusted to pH 7 and autoclaved in hard glass ampuls retained a stable pH after 5 months.

Mulford and Greenbaum (132) have reported the change in pH by sterilization of many pharmaceutical products as follows: dextrose, more acid; glycerophosphate compound, more acid; iron caedylate, less acid; magnesium sulphate, more acid; niereurochrome, more alkaline; physiological salt solution, more acid; procaine, more acid; procaine and epinephrine, more acid; sodium caedylate, no change; sodium iodide and salicylates with cocaine, no change; sodium salicylate, more alkaline.

A general method for maintaining stable pH during sterilization was suggested by Robertson, Woo and Sia (62). Water was twice distilled and rendered CO_2 free by passing CO_2 free air through it for 24 hours. Solutions of 7.5 molar H_3PO_4 and 7.5 molar $NaOH$ were boiled and kept in bottles stoppered with soda lime traps. The solute (various drugs were used) was added to the water, the H_3PO_4 was added, 1 cc. per 100 cc., and the solution brought to the desired pH by the addition of the $NaOH$ solution. When autoclaved, the solutions were only 0.1-0.2 pH lower and the pH values remained constant for 2-3 weeks. Benda (143) stated that by adding acid binding substances, such as caustic alkalies or soluble alkaline carbonates, phosphates or acetates, to solutions of salts of β -dialkylaminoarylpilosphinous acids, sterilizable solutions of stable pH are obtained.

Adjustment to Ophthalmic pH—The adjusting of pH is of considerable importance in ophthalmic therapy. Gifford and Denton (265) have recently conducted a detailed investigation of this problem and their results are summarized below. The retention of the lacrimal secretions is about pH 8.0. An acid buffer solution suitable for ophthalmic drugs soluble only in acid media, such as zinc salts, phenacaine, cocaine and epinephrine, is made from the following formula: 6.2 Gm. boric acid, 7.4 Gm. potassium chloride and distilled water to 1000 cc. The pH of this solution is 5.5. An alkaline buffer solution is less irritating and is a suitable medium for atropine, homatropine, physostigmine and pilocarpine. It is prepared by adding 1 cc. of a 0.20 molar sodium carbonate solution to 50 cc. of the acid buffer solution. The pH of this solution is 7.6. The alkaline solution is, of course, a less irritating collyrium than the acid solution.

The authors stated that phenacaine is soluble in the acid solution only if the pH is as low as 4.8. Atropine, homatropine, physostigmine and pilocarpine are soluble in both solutions but are more effective in the alkaline solution. Zinc salts precipitate in the tears unless the medium is as acid as pH 5.5. Sodium fluorescein dissolves only at pH 9.0 or above. Metaphen is soluble only at pH 8.0 or above. This is the reaction of the 1:500 solution and the pH remains unchanged when it is diluted to 1:2500. Butyn is insoluble in either buffer solution but is soluble in distilled water.

Gifford and Smith determined the following pH values for ophthalmic preparations:

	pH		pH
1.0% atropine sulphate	5.8	4.0% procaine hydrochloride	4.6
2.0% homatropine hydrobromide	5.5	1:1000 epinephrine	4.6
2.0% cocaine hydrochloride	4.6	2.0% butyn sulphate	5.4
1.0% pilocarpine nitrate	4.8	0.9% sodium chloride	7.0
0.2% physostigmine sulphate	6.6	0.2% zinc chloride	5.0
1:1000 nupercain	4.4	Saturated boric acid	4.2

When these are dissolved in saturated boric acid their reactions vary from pH 4.2 to 5.0.

pH AND TOXICITY

Alkaloids—In 1921, Crane (41) pointed out that the toxicity of alkaloidal salts is dependent upon the degree of hydrolysis. He stated that it is not the salt or ion which is toxic and that

variations in the hydrogen ion concentration affect the toxicity of alkaloids by changing the proportion of free undissociated base in the solution, rather than by direct action upon the cell. He found that with most alkaloidal salts there was 100 times as much undissociated base at pH 8.0 as at pH 6.0. Mayeda (116) later derived a mathematical expression for the degree of dissociation of alkaloidal salts as a function of pH . Designating with T_b the degree of hydrolysis of a salt composed of a strong acid and a weak base (alkaloidal salt) with a dissociation constant K_b , and with K_w equal to the dissociation constant of water, it was shown that

$$T_b = \frac{K_w}{K_w + K_b [H^+]} \text{ or } T_b = \frac{K_w}{K_w + K_b 10^{-pH}}$$

This equation shows that T_b is independent of the concentration of the alkaloidal salt but is dependent upon the magnitude of the dissociation constant K_b , the base or free alkaloid playing the role of a parameter. Mayeda plotted these functions (cf Fig 1) with the degrees of hydrolysis as ordinates and the pH values as abscissas. Referring to the graph, it is noted that each curve has a turning point at which the degree of hydrolysis has the value 0.5. If $pK_b = 7.0$, the hydrolysis varies as follows:

pH	5.5	6.0	7.0	8.0	8.5
% of hydrolysis	3.2	9.1	50.0	90.9	96.9

Assuming that the free alkaloid alone is biologically active, the activity is almost twice as great at pH 8.0 than at pH 7.0. Using cinchona alkaloids, Mayeda experimentally verified his mathematical results. He concluded the following: 1. The biological action of cinchona alkaloids is dependent entirely upon the amount of alkaloidal base freed by hydrolytic dissociation which in turn is a function of the pH . 2. Only the free quinine base is the bearer of biological action.

Hydrolysis Curves of Alkaloidal Salts with
Dissociation Constant K_b 10^{-6} 10^{-7} 10^{-8}

Fig 1

Gerlough (204) obtained the following results pertaining to the effect of pH on the actions of local anesthetics as measured by the rabbit cornea method. The duration of anesthesia produced by procaine hydrochloride, procaine borate and butyn increased with increasing pH . Duration of anesthesia by butesin picrate was unaffected by changes in pH . Butyn and procaine hydrochloride in buffered solutions had greater action than in unbuffered solutions of the same pH . Fosdick, Hansen and Dragstedt (151) also reported that an increase in alkalinity augmented the anesthetic properties of procaine and cocaine hydrochloride solutions. Their investigations showed that the efficiency of procaine borate and hydrochloride is practically the same at pH 8.4, but that the borate is more efficient at higher pH values and the hydrochloride is more efficient at pH values below 8.4. In general, these results with local anesthetic also point to increased biological activity when a greater amount of alkaloidal base is freed by dissociation.

Cosmetics—Eggerth (80) has published the results of a detailed investigation concerning the effect of pH on the germicidal action of soaps. Eggerth found for all soaps an acid and an alkaline range in which the soaps were most germicidal. Potassium butyrate was non germicidal in a concentration of tenth normal at all pH values within the limits of 3.8 to 10.5. He stated that solutions of soaps having 12 or more carbon atoms in the molecule were alkaline in reaction, and that increasing the number of carbon atoms in the chain increased the alkalinity of the solution due to increased hydrolysis. With increasing molecular weight of the soap, the germicidal titer increased to a maximum and then diminished, the point of inflection varying with the pH and the organisms. Thus, with *B. typhosus* at pH 5.5 the titer rose with increasing molecular weights up to capric acid and then diminished. With most organisms the maximum titer for the acid range was reached with lauric and tridecyl acids. In the alkaline range the germicidal action increased

with molecular weight to the palmitate and then diminished. The lower members of the saturated series of soaps were found to be most germicidal in an acid reaction. For instance, the titer for potassium caprate was 1000 times as great at pH 4.4 to 4.7 as it was at pH 9.0 to 10.0.

Eggerth proposed the following explanations concerning the relation between pH and the germicidal action of soaps: 1. Hydrogen ions and hydroxyl ions may affect the bacterium rather than the soap. 2. An acid reaction may decrease the surface tension of the soap and thus increase its concentration at the surface of the bacterium. 3. The pH effect may be due to alterations of the solubility of soap in the aqueous phase or in the bacterial protoplasm. 4. The fatty acid may have a greater germicidal action because the acid is less dissociated than the soap and there is evidence that undissociated molecules penetrate more readily into protoplasm than do ions.

Janistyn (211) called attention to the value of certain acids (anisic, formic, benzoic, butyric, citric, acetic, gallic, tannic, glycerophosphoric, camphoric, etc.) in concentrations giving a therapeutic skin pH of 3.0 to 5.0 in soaps, skin, mouth and hair preparations and other cosmetics. Janistyn stated that the disinfecting action of buffered acids is greater than that of unbuffered acids because of the higher acid ion concentration. An anonymous article in the *Drug and Cosmetic Industry* (302) stated that the normal pH of skin is between 4.5–5.0 and that any cosmetic which has a strong alkaline reaction is detrimental to the skin. This article stated that the pH range of blood is from 7.0 to 7.4 and that face creams whose pH values deviate from this range cause irritation to the epidermis. The author also pointed out the existence of acid and alkaline ranges wherein an optimum effect can be obtained from antiseptic lotions. Mayer (320) has shown the value of pH control in the manufacture of shampoos and has stated that a properly designed soapless shampoo base should have a pH of about 7.0 to 7.5.

Preservatives and Antiseptics—The preservative action of acids and bases is in a large measure, a function of hydrogen and hydroxyl ion activity, and also, specific effects which were previously suspected of certain acids and bases have now been clearly demonstrated by the use of hydrogen-ion methods. The effects of these ions are greatly complicated by various conditions associated with the colloidal phases and degrees of permeability of cell membranes. The alteration of the colloidal phase conditions often depends upon the inorganic ions which are present. Thus, calcium favors the permeation of oil soluble substances and sodium of water soluble substances. An interesting feature of permeability is that weak acids or bases penetrate cells readily whereas strong ones fail to do so. The direct action of hydrogen ion concentration upon cells must be kept distinguished from its control of the effective state of a toxic compound. The relationship between pH and toxicity to microorganisms is discussed below in three phases: The preservation of foods, the preservation of drugs and the effect of antiseptics in therapy.

In 1929, Cruess and Richert (124) found that the concentrations of sodium benzoate required to prevent the growth of yeasts, molds and bacteria were greatly affected by the pH values of the medium. In a later publication (195) Cruess, Richert and Irish stated that the concentration of sodium benzoate necessary to give the same preservative action at the neutral point as at pH 3.0 was 200 times as great. Still later, Cruess (236) observed that for the destruction of fermentation organisms, 4% of sodium benzoate was required at pH 7.0, 0.06–0.1% was required at pH 3.5–4.0 and 0.02–0.03% was required at pH 2.3–2.4. He stated that some molds grew profusely in a 10% sodium benzoate solution of pH near neutrality. In asparagus juice *Clostridium botulinum* grew and formed toxin at pH 7.4 with 0.8 Gm. of sodium benzoate per 100 cc. The organism did not grow at pH 4.7 with 0.1 Gm. of the preservative per 100 cc. In regard to other salts of weak acids, it was stated that in the pH range 5.0 to 9.0 the necessary concentrations of sodium salicylate, sodium sulphite and potassium acetate were considerably higher than in the pH range 2.0 to 4.5. From these observations Cruess concluded that the undissociated weak acids, rather than their ions, are the preservative agents. This conclusion is in direct accordance with that of Eggerth (80) who stated that undissociated molecules penetrate more readily into protoplasm than do ions. Cruess' observation that lowering the pH did only slightly enhance the preservative actions of sodium chloride and formaldehyde also supports the conclusion of Eggerth.

In 1932, Back (233) reviewed the use of preservatives in pharmaceutical preparations. He stated that concentrations of vinegar, equivalent to 2.5–3.5% of acetic acid, are sufficient to prevent fermentation in sauces and similar preparations. Lactic acid is satisfactory as a preservative but there is evidence that citric acid in equivalent strength is less effective. He stated that in

addition to the p_H value, the nature of the anion affects the preservative properties. If sugar is used the concentration must be 66% or above. He also stated that, in general, a concentration of 8-15% of salt inhibits bacterial growth but that many yeasts grow in a 25% salt solution, even concentrated brine will not kill spores. Walbum (297) found that the resistance of earth spores to destruction was greatest at p_H 8-9 and quickly decreased on the acid and alkaline sides.

The effect of insulin solutions (20, 32 and 40 units per cc), without preservatives, and of a solution of 40 units per cc with 0.3% tricresol on the viability of *Staphylococcus albus*, was studied by Hartley (208). Solutions of p_H 3-4 had a germicidal action with no preservatives present. When the normal acidity of a solution containing no preservative was even slightly reduced, staphylococci were not killed and considerable growth occurred at p_H 6.0. When p_H 8.5 was reached, the solutions, in most cases, again did not allow growth of staphylococci. It seems that the insulin itself has a toxic effect on microorganisms because, on ordinary culture media, staphylococci develop most favorably in a slightly alkaline reaction and growth is not inhibited by p_H changes from 5-9.

With regard to the British Liquor Arsenicalis, Milne and Rattray (280) found that when organic matter was completely excluded during preparation, very little growth of molds occurred at temperatures suitable for their rapid development and that the growth was most at p_H 7.0.

Joachimoglu (57) has investigated the influence of p_H upon the antiseptic effect of mercuric chloride solutions buffered with glycoll, NaOH and HCl. The final dilutions of mercuric chloride were 1:672,000. There was strong antiseptics at p_H 3.3-4.0, no effect at p_H 7.8-10.1, a slight effect at p_H 10.5 and strong antiseptics at p_H 11-12 corresponding to that between p_H 3.3-4.0. When buffered with secondary sodium citrate and sodium hydroxide, positive antiseptic action was obtained between p_H 5.0-6.6.

Daniels and Lyons (196) have studied the effect of p_H upon the antiseptic actions of phenyl substituted acids from benzoic to ϵ -phenyl caproic. They could find no definite relation between p_H and antiseptic effect but did note that there was a gradual rise in p_H as the series ascended. They found the antiseptic actions of certain phenols to be strongest in an acid range below p_H 4.5 and in an alkaline range above p_H 10. They also stated that the undissociated acid molecule is the active portion in disinfection by means of acids, whereby the antiseptic action would be inversely proportional to the hydrogen ion concentration. Janistyn (211) claimed that the disinfecting action of acids is greater when they are buffered because of the higher acid-ion concentration. He cited experimental evidence to show that lactic acid and sodium lactate of p_H 3.7 in a concentration of 1:15 is equivalent in disinfecting power to 65% ethyl alcohol.

Kunzmann (275) has stated that hydrogen ion concentrations between p_H 6.5-7.5 had no effect upon the disinfecting properties of potassium iodide and sodium iodide solutions. He found that potassium iodide was more effective than sodium iodide but that the effect of both was decreased when they were mixed.

p_H AND STABILITY OF DISPERSED PHASES

Before entering into the discussion of the relation between p_H and the stability of drugs, it will be of value to consider the work performed by the Swiss pharmacists Tschurch and Fluck (119), (125) on instability caused by the presence of acacia. They have found that acacia contained one or more oxidizing enzymes and that these enzymes attacked most alkaloids and glucosides. The manner of action on morphine indicated that the oxidases attacked especially the free hydroxyl groups. Acacia, which had been inactivated, did not oxidize morphine. It was found that the oxidases of gum arabic were able to act in a pill mass with a moisture content of 2% or above. Tschurch and Fluck found that the acacia could be inactivated, as shown by the guaiac and benzidine test for oxidase, by boiling a mucilage to dryness, or by precipitating the gum with boiling neutral alcohol. The authors pointed out that precipitation of the gum by acid alcohol produced an inactive powder which after completely washing out the acid, would not dissolve in distilled water but which required an alkaline condition for solution.

Emulsions—The preparation of stable emulsions has been for many years a disconcerting problem. When emulsions were conceived as a fine dispersion of one liquid in another, the size of the dispersed particles was considered to be the only important factor controlling the stability. Later investigations have shown that a purely mechanical conception is not sufficient and that emulsion formation is affected by factors similar to those affecting colloid formation.

Different emulsifying agents have been found to cause opposite phase dispersions and to cause different ranges of stability along the p_H scale. Harkins (30) has stated that sodium oleate and similar compounds produce emulsions of the oil-in-water type, whereas calcium and magnesium oleates and other compounds in which 2 hydrocarbon radicals are attached to 1 metallic atom produce water-in-oil emulsions. Harkins found that emulsions produced by magnesium oleate disintegrated when the p_H of the aqueous phase became as low as 2.5. He attributed this disintegration to the decomposition of the emulsifying agent, which must be in contact with the dispersed phase. Krantz and Gordon (113) substantiated Harkins' results and stated that with magnesium oleate emulsions the most stable p_H range of the internal phase was between 11-12.5. The same authors (130) found that in magnesium oleate emulsions, the size of the dispersed particles varied between 17-30 microns. They also stated that with this type of emulsion, p_H did not significantly affect the surface tension, that there was a decided drop in viscosity on the acid and alkaline sides of the p_H range 0.9-13.0, that the emulsions in mineral oil were unaffected by the addition of sodium chloride but that the emulsions in olive oil were made less stable by the addition of sodium chloride. The authors concluded their discussion of magnesium oleate emulsions by stating that the most important factor in the stability of these emulsions is the influence of the hydrogen ion concentration of the dispersed phase upon the magnesium oleate.

Krantz and Carr (242) recommended the use of magnesium oleate in the preparation of Ointment of Rose Water because it produced a neutral, stable and compatible water-in-oil emulsion. They stated that all salts producing an hydroxyl ion concentration represented by p_H 9.17 or above produced satisfactory ointments.

Krantz and Gordon (86) (113) found that oil-in-water emulsions produced by acacia had a wide stability range within p_H 1.6-10.35, with greatest stability between p_H 4.11-4.28. The results were the same whether the oil was vegetable or mineral, or whether the acid used was hydrochloric or sulphuric. Addition of sodium chloride showed that the chlorine ion did not influence stability. The surface tension varied slightly with p_H being a maximum at p_H 7.3 and decreasing by about 30% at the acid and alkaline extremes. Viscosity was unaffected by p_H . The size of the particles was smallest near p_H 7 and increased considerably with increasing p_H values and increased very little with decreasing p_H .

The same authors found that oil-in-water emulsions produced by tragacanth had a range of greatest stability within the p_H limits of 1.9-2.3 and had another, more narrow, and less stable range, at about p_H 6.3. Tragacanth emulsions differed also from acacia emulsions in that their viscosity decreased with increasing p_H . In considering gels of tragacanth, the authors found that only those between p_H 0.4-2.1 remained free from the separation of water at the surface. The most stable range of p_H for tragacanth emulsions lies within this scale. The authors claimed that this supports the hydrate theory of emulsions¹ which postulates that oil is most thoroughly emulsified in a hydrophilic colloid when just a sufficient amount of water is present to form a hydrate. With tragacanth, according to Krantz and Gordon, this amount of water is evidently a function of its hydrogen ion concentration. Therefore, at the p_H value where tragacanth possesses the highest degree of hydratability, this value is the most stable point for emulsions prepared with tragacanth.

Krantz (129) has investigated the buffer actions of both acacia and tragacanth. The buffer capacity $\frac{\Delta B}{\Delta p_H}$ of acacia was found to be 0.034 and to extend over a wide range. Since acacia consists of the K, Ca and Mg salts of a weak acid its buffer capacity is more effective in the neutralization of acids than of alkalis. This was shown by Krantz when he plotted the buffer capacity (cf Fig 2). At p_H 10.5 the curve became very abrupt, but below 2.5 the curve descends as a gradient. This accounts for the extreme instability beginning on the alkaline side of the p_H stability range. Tragacanth exerted considerable buffer capacity between p_H 3.0-10.0. In view of the wide buffer capacities of these two emulsifying agents Krantz (165) attempted to increase their stability ranges by buffering the external phases. With acacia, no increase in stability was observed between p_H 2-10.5, but with tragacanth, the stable range of 1.9-2.3 was increased to p_H 1.9-5.0.

On account of the sharpness of the single break in the titration curve of acacia Taft and Malm (228) have claimed that arabic acid is evidently a strong monobasic acid. They explained

¹ Fischer, 'Fats and Fatty Degeneration,' page 5 (1917)

the viscosities, densities, freezing points and conductances of acacia solutions of widely variable concentrations by assuming that acacia acts as a strong organic electrolyte rather than as a colloidal phase when in contact with water. They attributed the protective action of acacia solutions to their high viscosity and to the probable high adsorption of the acacia molecules.

According to Friedman and Evans (203), the stability of gelatin emulsions is dependent upon the pH , and, to a small degree, the concentration of the gelatin. The stability range, in general, was between pH 3-6, with a few emulsions becoming very unstable near pH 3 when the gelatin concentration was as low as 0.25%. When the pH of the gelatin solution was near the isoelectric point (about pH 4.95), the most stable emulsions were formed. Stability sharply decreased at pH of about 3.0, there was another point of increased stability near pH 2.5, and a sharp drop in stability when the pH was further decreased. Addition of alkali resulted in a marked decrease in stability above pH 6.0, with another range of stability near pH 8-10, and another decrease when the pH rose above 11. A summary of these results shows that there are two pH ranges for stability, one from pH 3-6, and the other in the vicinity of pH 8-10. This is in accordance with the results of Kraemer (85), who reported finding two isoelectric points for gelatin, one at pH 4.95, and the other near pH 8.

Enz and Jordan (239) reported the following results after investigating the ease of emulsification of alkaloid containing preparations. Fluidextract of Belladonna Leaves showed least emulsification at the neutral point, Tincture of Stramonium and Fluidextract of Cinchona showed least in acid solution, and Fluidextract of Hydrastis and Tincture of Nux Vomica showed no uniformity. According to the authors:

"The results indicate that the statement, emulsions are less apt to form in strongly acid or alkaline solutions than in those which are neutral, is true only in specific instances."

According to some experimental work reported by Weeks (185), at pH values less than 7.0, the area of a water spread emulsion for a given pressure increased with time without reaching an equilibrium. At pH values above 7.0, the area finally became constant with time but the values were large and were dependent upon the pH . At pH 7.0, the water spread emulsion showed a constant area with time for a given pressure and quickly reached the equilibrium.

Colloids—Unless conditions are favorable, a colloidal solution may be a very transient system. There are many pharmaceutical colloids representing and acting as transition cases between the two practical classes of colloidal solutions. Thus, gelatin, acacia, albumen and mercury ointments represent the class of reversible or lyophile colloids, and metallic suspensions and the two silver protein preparations represent the irreversible or lyophobic colloids. A consideration of the stability of colloidal solutions reveals two important stabilizing agencies, solvation and electric double layers, the former being typical of lyophiles, the latter of lyophobic.

Considerable work has been done concerning the effect of acid base equilibria on the stability of colloids. Those colloids of the lyophile class representing mostly the effects of macromolecular solvation, are less affected by ionic phenomena than are those of the lyophobic class. Electric double layers are responsible for the stability of most hydrosols of inorganic substances in the absence of protective colloids and these layers are sensitive to the charges of electrolytes. According to theory, as two particles carrying electric double layers approach each other the outer layers are deformed or polarized and an electrical repulsion results. The electrokinetic potential necessary to prevent adhesion is considered to be about 15-25 millivolts. Since the potential of non ionic and sparingly soluble ionic particles in water is not so large, stability usually requires the presence of a definite amount of an electrolyte, one ion of which is adsorbed by the particle.

Fig 2

In 1922, Bogue (46) showed that various physical properties of colloids, including the viscosity, jelly strength, melting point and joining strength, were a minimum at a pH corresponding to the isoelectric point. As the acidity or alkalinity increased from this point, these properties rose in value. In 1925, Johnston and Peard (75) determined the isoelectric point of gelatin as pH 4.7. The surface tension was a maximum at this point and a minimum at pH 3.8-4.0, and in the neighborhood of pH 9.0. A second maximum was found at pH 2.8-3.0, below which the surface tension steadily decreased. Addition of electrolytes also lowered the surface tension. A year later, Kraemer (85), using the Tyndall effect to designate the isoelectric point of gelatin, determined the point as pH 4.9, the Tyndall effect indicating a maximum tendency to precipitate at this point. He suggested a second isoelectric point near pH 8 where there was a distinct decrease in light dispersion. The maximum gel strength appeared on either side and very near to the optimum precipitation point, or isoelectric point, illustrating that gel formation takes place under conditions which are just adjacent to those leading to readiest precipitation or coagulation. Kraemer stated that, contrary to the usual assumption, the gel formation was very small within a narrow range at the isoelectric point.

Recent literature reflects considerable interest concerning the effects of hydrogen ions and other ions on the swelling of gelatin. This phenomenon has nothing to do with the decomposition of gelatin or with the destruction of the colloidal state, but rather it is caused by the production of a higher osmotic pressure within the separate particles of gelatin, due to a Donnan equilibrium set up between the particles. Concerning this subject the reader is referred to J. Loeb¹ and Miller and Pleass (131) (173).

Many workers have studied the influence of hydrogen ions on the coagulation of colloidal solutions. Ghosh and Dhar (82) have explained the coagulation by electrolytes of solutions of ferric hydroxide, chromium hydroxide, mastic and gamboge, according to the following principles: 1. Adsorption of ions carrying the same charge as the sol. 2. Hydrolysis of the sols and consequent generation of acids which stabilize the sols. Addition of acids renders the sols unstable by checking their hydrolysis, but addition of alkalis increases the stability by increasing the hydrolysis of the sols. 3. Hydrolysis of the coagulating electrolytes.

The explanation of coagulation which has been offered by Hazel and Sorum (209) is similar but more readily acceptable. They claim that for a positive sol (there are both positive and negative sols), the anion of the added electrolyte is the effective agent in producing coagulation. Hence the flocculation values for monovalent ions are higher than for bivalent or trivalent ions. The authors determined the effects of the following groups of electrolytes upon ferric oxide solutions:

1. Univalent salts
2. Bivalent salts represented by $BaCl_2$
3. Trivalent salts represented by $FeCl_3$ and $AlCl_3$
4. K_2SO_4 , $(NH_4)_2SO_4$, $CaSO_4$
5. K_2CrO_4 and $K_2Cr_2O_7$
6. $K_3Fe(CN)_6$ and KH_2PO_4
7. $K_4Fe(CN)_6$

The flocculation values decreased for Groups 1, 2 and 3 respectively. In Groups 1, 2, 5 and 6, the flocculation values decreased with increasing hydrogen ion concentrations. The effect of electrolytes of Group 3 did not vary with pH , both electrolytes being salts of a strong acid and weak base, whereby their hydrolyses produced a constant pH . The flocculation values of the electrolytes in Group 4 increased with increasing hydrogen ion concentrations. Bedford Keller and Gabbard (256) have also reported that the presence of sulphates caused the stability of ferric oxide solutions to vary inversely with the hydrogen ion concentration.

Morton (220) has performed electrometric studies which have revealed the complex formations and colloidal conditions of pharmaceutically important iron compounds. Electrometric titrations were performed to determine the cause of the non-precipitability by volatile alkalis of solutions of iron "citrochloride". This was found to be due to the formation of the basic colloid complex, $FeC_6H_5O_7 \cdot 2Fe(OH)_3$. In the absence of complex formation, that is, without the addition of citric acid or alkali metal citrates, the red color of basic iron salts was exhibited at pH 2.2 and

¹ "Proteins and the Theory of Colloidal Behavior" (1924)

at pH 2.36 the solution became colloidal. Coagulation occurred at pH 6.48. This indicated that only in strongly acid solutions can the ferric ion exist in an appreciable concentration.

Morton reported that Fehling's solution consists of a basic colloid-complex, $3CuC_4H_4O_6 \cdot 5Cu(OH)_2$, peptized by excess of tartrate ion. He explained that the cataphoretic behavior of the hydrosol is due, not to the presence of complex anions, but to the negative colloid-complex.

In a later work, Morton (221) reported that in pharmaceutical mixtures of the ferric chloride sodium salicylate bicarbonate type the iron is present partly as a violet crystalloid complex, $Fe(OH)(C_6H_4OHCOO)$, and partly as a red basic hydrosol, the proportion of the metal present in each form depending on the degree of acidity or alkalinity. In acid solutions, the hydroxy-acid complexes of iron were found to be present mainly as true electrolytes, but in alkaline solutions they were decomposed to varying extents with the formation of basic hydrosols. Their apparent stability in alkaline solution was assumed to be due to the peptizing and protecting properties of the hydroxy acid anion.

pH AND STABILITY OF COMPLEX PRODUCTS OF BIOLOGICAL ORIGIN

Proteins—The vast amount of investigation dealing with the structure of proteins have given rise to much information concerning the effect of pH upon the decomposition of proteins. Although most proteins do not require stabilization, the general principles concerning their decomposition are of wide scientific interest and can be applied to the problem of stabilizing toxins, antitoxins and insulin.

Northrop (45) has studied the decomposition of gelatin and has reported that in acid solutions of pH less than 2.0, the velocity of hydrolysis was directly proportional to the hydrogen ion concentration, and that in alkaline solutions of pH greater than 10.0, the velocity was directly proportional to the hydroxyl ion concentration. Between pH 2.0 and 10.0 the rate of hydrolysis was approximately constant and was much greater than would be calculated from the hydrogen and hydroxyl ion concentrations.

In 1930, Svedberg (181) published some generalized results related to the pH stability regions of proteins. He found a number of proteins to be monodisperse, that is, homogeneous as to molecular weight. They were divided into two groups, the first containing those with molecular weights from 34,500 to 208,000, the second containing those with molecular weights in the millions. Those of the first group fell into four classes with molecular weights 1, 2, 3 and 6 times 34,500. The monodisperse proteins had a wide stability region, usually between pH 3-11, and including the isoelectric point of the protein. This point was never in the middle of the stability region but was always shifted in the direction of the low pH values. The protein molecules containing more than one group of weight 34,500, split into molecules of $1/2$, $1/3$, and $1/4$ of the original as the pH value was raised. At sufficiently high alkalinity all proteins had the molecular weight 34,500. The same results were obtained by lowering the pH . This decomposition was reversible in many cases. When the mixture was restored to a pH within the stability range, molecules of the original weight were built up out of the fragments.

Sjogren and Svedberg (178) found that egg albumen was stable with regard to molecular weight in the pH range 4-9. The decomposition was measured by the velocity of sedimentation caused by ultracentrifuging. At pH values below 3 the sedimentation increased, indicating the formation of aggregates of denatured proteins, at pH values above 9 the sedimentation decreased, indicating the breaking up of the molecules. The molecular weight was determined as 34,200.

Svedberg and Heyroth (137) studied the pH stability of hemocyanin, which has molecular weights of 5,000,000. The molecular weight was constant between pH 4.5-7.4. As these limits were approached the protein molecules became hydrated, and as the limits were exceeded they rapidly disintegrated into smaller particles of undetermined magnitude. The acid disintegration was reversible in its earliest stages but the disintegration of the products first formed continued slowly and was irreversible in its later stages.

Nasset and Greenberg (133) have studied the rate of hydrolysis of casein in acid solutions. They claimed that the effect of acids was catalytic in nature and reported that the hydrolysis was proportional to the hydrogen-ion activity of the acids. The velocity constant for the three acids used decreased in the following order: HCl , H_2SO_4 , H_3PO_4 . The rate of hydrolysis conformed to the equation for a reaction of the second order.

In 1925 Brownlee (73) generalized his observations concerning the stability of toxins and

lysin by stating that the optimum pH for the stability of these substances varied from pH 6-7.5. His observations showed that the decomposition at ordinary temperatures was slower on the alkaline side than on the acid side. Schmidt (176) reported that diphtheria toxin was stable at $18^{\circ}C$ between pH 6.5-9.0, while at pH 5.4 or 9.9 the antigenic power was slowly destroyed, even when the temperature was $0^{\circ}C$. At $37^{\circ}C$ and pH 7.0 the antigenic power was destroyed. Flocculation by mixtures of toxin and antitoxin was prevented when the mixtures were freed from electrolytes or when the electrolyte content exceeded certain limits which varied greatly with different concentrations. The flocculating power of the antitoxin decreased with increasing temperature and alkalinity. The condition was reversed by acidifying. Schmidt stated that diphtheria antitoxin was much more stable to the destructive action of salts than was the toxin, and that salts of oxidizing and reducing acids and of certain aromatic acids completely destroyed both the toxin and antitoxin. Neutral salts had almost no influence.

With regard to tetanospasmin, a component of tetanus toxin, Selbreck (292) stated that acidification decreased the rate of heat inactivation of the lysin and that alkalization accelerated the heat inactivation. Acidification of the lysin to pH 4.0 decreased the rate of oxidation, and acidification below pH 4.0 increased the rate of oxidation. Acidifying to pH 3.0 caused considerable inactivation in the absence of heat or oxidation. This indicates maximum stability of tetanus lysin near pH 4.0.

Much work of a similar nature has been done concerning the decomposition and precipitation of serum proteins (81), (100), (156), (180).

Remesow (174) has relieved some interesting results bearing on the coagulation of lecithins and cholesterins. The solutions of both were lyophobic colloidal solutions of suspensoid character. The coagulation limit for cholesterins was pH 4.0, for cholesterin esters, pH 2.0, and for lecithins between pH 6.2-5.6. The flocculation optimum for lecithin solutions lay between pH 2.8-2.0. A large number of substances the most important biologically such as egg white, hydrocarbons, alkaloids, ferments, etc., were found to sensitize the lecithins and cholesterins in such a manner that their coagulation values were displaced to different pH values. Tables were included which showed the precipitation or lack of precipitation of cholesterins, cholesterin esters, lecithins and hydrolecithins at various pH values and under the sensitizing actions of more than 50 physiologically important substances and drugs. This so-called sensitizing action was proved to be one not between the substance and the sensitizer as in ordinary precipitation.

Hormones—Krogli and Hemmingsen (111), in 1928 reported that the optimum pH range for insulin stability was between pH 2.0-4.0. This optimum range has been modified later. The authors reported a distinct alkaline shift during decomposition and stated that the solutions became opalescent above pH 4. Gaddum (152) also found the stable range for insulin to be from pH 2.0-4.0 and reported exceedingly rapid decomposition above pH 7.0 and below pH 1.0. In 1931 Sjogren and Svedberg applied ultracentrifugal methods for measuring the decomposition of insulin and thereby determined the pH range for optimum stability to be between pH 4.5-7.0. Near the borders of this region the decomposition was reversible. By ultracentrifugal means the authors determined the molecular weight (35,100), sedimentation constant, molar friction constant and molecular radius. The values were very nearly identical with those for egg albumen. Mogilskii (218) has reported that the isoelectric point of insulin was between pH 4.3 and 5.7, depending upon the purity of the solution.

Freudenberg and Eyer (201) have investigated the destructive action of acids and alkalis on insulin. The extreme instability to alkalis was evidently due to the cleavage of 2 molecules of NH_2 . One molecule of NH_2 was attacked by oxidizing agents and the other by reducing agents. Acids caused separation of NH_2 by hydrolysis. Wintersteiner (298) found that by varying the pH between 6.0-8.0, and using cysteine, thioglycolic acid and alpha thiolactic acid as reducing agents, with all three compounds the rate of inactivation of insulin increased with increasing pH .

The control of pH is of special importance in the preparation of pituitary extracts free from animal protein. Whenever the protein is precipitated a certain amount of the pituitary principles is destroyed. It is desirable to obtain a pH value whereby the best possible compromise can be attained between the amount of protein destroyed and the amount of active principles remaining. The original work was done by Dudley (32), Abel and Nagayama (35), and Strasskr (90) who pointed out the acid lability and the extreme alkaline lability of both the oxytocic and vasopressor

constituents of pituitary Abcl and Nagayama observed that the acid destruction of the extracts caused the formation of histamine which produced a lowering of arterial pressure instead of the desired increase Gaddum (152) stated that for the oxytocic principle the effect of variation of the pH was a minimum between pH 7-8, but that the absolute optimum pH for stability was 3.0 The presence of salts caused a very small increase in destruction Gaddum summarized his results in a table which gives the amount of destruction of the oxytocic principle to be expected, when a solution of any pH is heated at any given temperature for any given time

Gclrough (153) carefully measured the amounts of inert protein which were precipitated by various reagents and at various pH values when the pituitary extracts were placed in boiling water for 12-14 minutes These results are summarized in Fig. 3 and can be compared with the pH stability curve for oxytocin formed from Gaddum's data for the same temperature and same duration of time The tungstic acid curve shows the greatest precipitation of protein but this reagent must be excluded because only 30-40% of the oxytocic principle remains after treatment A comparison of the two graphs shows that although the maximum stability occurs at pH 3.0-3.4, the maximum precipitation of inert protein which allows only a reasonable decomposition of the active principle can be obtained when the extract is adjusted to pH 4.4 with acetic acid

The hydrolysis of acetyl choline was investigated when a relation was suspected between it and the oxytocic pituitary principle Gaddum (152) found the optimum pH for its stability to be 3.9 Hofmann (157) found that the hydrolysis of acetyl choline chloride solutions produced an acid reaction which gradually checked the hydrolysis The least hydrolysis occurred at pH 3.9 with considerable hydrolysis occurring at pH 5.0 The cleavage of acetyl choline was considerably depressed by the addition of non electrolytes, such as antipyrine and acetamide The effect of acid upon the racemization of *l*-epinephrine has been investigated by Haddock (267) In 10% hydrochloric acid, a solution of *l*-epinephrine was completely racemized in 12 hours, but in normal hydrochloric acid (3.6%), racemization was only 58.5% in 216 hours In the latter case, 10% was destroyed by oxidation In HCl solutions of pH 1.4, the racemization of 1% epinephrine was negligible even with exposure to ultra violet light Barker, Eastland and Evers (234) found that the oxidation of epinephrine by potassium persulphate was most rapid at pH 5.6, the rate of oxidation being one-fourth as great at pH 4.7 and 7.1 The presence of small quantities of copper greatly increased the rate of oxidation and iron showed a slight inhibitory effect

Marshall (278) stated that the p factor of the gonadotropic hormones lost 50% of its activity in 17 days when adjusted to pH 7.0 and preserved with 0.5% phenol

Vitamins—The experimental work concerned with the stability of vitamins can best be summarized in the following table The experiment represented by the first tabulation for the B_2 factor, in which no decomposition occurred, was performed upon a liver concentrate

Enzymes—A discussion of the relation between pH and the activity of enzymes is far beyond the scope of this paper It is sufficient to say that each enzyme has an optimum pH for action and that changes in enzyme activity with changes in pH are evidently related to the state of ionization of the substrate and the enzyme References are (21) (23) (51) (67) (73) (101), (104), (117) (207) (232) (283)

Northrop (38) found that pepsin in solution at 38° C attained an optimum stability at pH 5.0 with slow destruction occurring at lower pH values and very rapid destruction at higher pH values. The inactivation of the pepsin was not reversible. Loughlin (277) claimed that the rate of heat inactivation of pepsin was a minimum and was almost constant within the pH range 3-4.5. Vahlteich (93) stated that Chlor of Pepsin of the N F formula deteriorated 100% during 2 years, but when no hydrochloric acid was added the chlor deteriorated only 36% in the same period of time. The author stated that the pH of the chlor which lost their entire activity was close to the optimum pH for peptic digestion (pH 1.2-1.6).

Pace (172) reported the optimum pH for trypsin stability as pH 6.5. The optimum pH for trypsin activity is 7.5-8.3. McGillivray (166) reported the optimum pH for the thermal stability of pancreatic lipase as pH 6.0. The optimum pH for lipase activity varies from 5.0-8.5, depending on the source.

(To be continued)

THE CHEMISTRY OF THE HORMONES

Under above title the *Journal of the American Medical Association* (March 30th) states:

"Although the question of the chemical nature of the hormones has been a subject of interest for nearly two decades, progress in this field has been exceedingly difficult because of the lack of endocrine preparations of sufficient purity for accurate chemical studies. Recent extensive investigation, however, has led to vastly improved methods of preparation and ultimately to the isolation

in pure crystalline form of a number of the hormones. Thus these heretofore inaccessible substances have been brought within the scope of attack by the chemist. Indeed, at present several hormones have been prepared in crystalline form and the chemical structure and method of synthesis of two of these have been definitely established. Also a number of other hormones have been prepared in a highly purified although noncrystalline state and some information regarding their chemical properties has been obtained.

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P EDITOR OF THIS
DEPARTMENT

Habitat learned by "brute memory" is easily forgotten while habitat associated with geography, history and travel will be easily learned and not easily forgotten. Dr. Wirth has presented, in the following paper, excellent suggestions for associating drugs with geographical locations. Such suggestion followed and expanded will add interest and pleasure to the teaching of a phase of pharmacognosy that can easily become burdensome.—C. B. JORDAN, *Editor*

THE TEACHING OF HABITATS IN PHARMACOGNOSY *

BY ELMER H. WIRTH ¹

In the learning of habitats the average student associates with the name of the drug, the name of a geographical locality, a name having some familiarity perhaps, but which in the end means nothing more than just another name for him to memorize. These facts, however, must be learned and in some cases "brute memory" seems the only solution. Yet, in many cases, we may perhaps find methods of association which will not only ease the student's burden, but will create within him a desire to think. And after all the thinking student will be a far greater credit to his profession than the one who has learned "à la parrot fashion."

In the teaching of habitats such desirable association may be created. The best way perhaps involves the instillation of some geographical knowledge along with the discussion of the drug. This after all is not a difficult task as most students display considerable interest in information concerning foreign lands. It can be done in three ways. *First*, by accounts of the history, collection and commerce of the drug, with mention of the topography and the locality of the region where it is found or cultivated. If the drug is one mentioned in the Bible, the Travels of Marco Polo, or other historical or travel work, familiar to the student, his interest is automatically excited. A second way involves the use of pictures. This brings into play a visual aspect of what was expressed above. The free use of photographs, or preferably lantern slides, in illustrating accounts of the commerce of drugs makes an invaluable combination.

A third way concerns maps. The drug map represents a more or less extended geographical area and presents a collective picture of the traffic in drugs. It has been our experience that considerable may be accomplished with maps. The Pharmacognosy Museum contains an habitat case holding some two hundred samples of crude drugs, each sample being attached by means of a streamer to its locality on a large world map. Various other cases in the museum contain small maps illustrating particular features in the traffic of the drugs displayed.

Our laboratory manual in Pharmacognosy is of the loose leaf type to facilitate its being combined with the laboratory notes and drawings. Into this manual we have inserted six outline continent maps, corresponding in size to the pages of

* Parts of a paper read before Teachers' Conferences, A. A. C. P., Washington meeting 1934.

¹ Assistant Professor of Pharmacognosy, University of Illinois College of Pharmacy.

the manual. The continent maps are preferable to a single world map in that crowding is eliminated. As each drug is considered its habitat is briefly discussed, taking into consideration the country yielding it together with its cultivation and commerce. The student enters the habitat in his notes, at the same time indicating its location by printing or writing the name of the drug on the proper map.

This method at once accomplishes several things. The maps give the student a graphical picture of pharmacognostical and ecological distribution over the various parts of the earth. His interest in geography is renewed as he sees its connection with other divisions of learning, particularly his chosen profession. He begins to accept a collective picture in which several relationships are orientated. His general knowledge is increased. His interest is stimulated. And finally, he retains his habitats with much less effort because he has diverged from the forceful mechanical association of terms which mean little more to him than combinations of letters, to a logical method of proper association.

The question naturally arises as to the value of habitats. They comprise but a minor part of pharmacognostical instruction and undue stress should not be placed upon them, especially at the expense of other more valuable instruction, yet, as has been explained, they offer a link in the association between pharmacognostical and other knowledge. They comprise, therefore, a division which the teacher should not overlook, in his effort to create interest in his subject. After all, when pharmacy goes before the public annually during Pharmacy Week, what is the center upon which the great majority of displays are built? The drug map.

Should students who have not had a thorough course in physiological chemistry be taught one phase of it such as urinalysis? To day the physician is not satisfied with urinalysis alone but he usually wishes a more complete analysis involving blood analysis, gastric analysis, etc. However, there is still perhaps a demand in certain localities for the pharmacist who is able to do simple urinalysis. If so then such a course should be offered in the college of pharmacy. The following paper by Professor Greene and a discussion by Professor Gershenfeld will be of special interest to the instructor who is called upon to offer a course in urinalysis.—C. B. JORDAN, *Editor*

TEACHING URINALYSIS TO STUDENTS OF PHARMACY

BY ANTOINE E. GREENE *

Perhaps this paper should be prefaced with an apology. If the present and future curricula in pharmacy are to be governed by the stern mandates of the Fourth Edition of the Pharmaceutical Syllabus, there will be no place for a course in Urinalysis, and this paper will be but a reflection of the ancient history of the subject.

It is the prayerful purpose of this paper to utter a protest, to enter an appeal. There is always the fundamental need for the consideration of local situations. In this period of tremendous transition in our education methods, we should be governed by the rule of curricular elasticity. While, in the main, we should attempt a firm adherence to unified basic and professional subjects, we should have open minds to receive and understand a "theory of elasticity" in the setting up of elective

* Associate Professor of Pharmacy, School of Medicine, Howard University, Washington

courses for our student body. Cast iron courses in a cast iron curriculum, with little chance for change or diversion, for student participation or interest in the choice of electives, are to be deplored. These straight and narrow curricula sterilize the students' interest, enthusiasm and ambition. It is our high hope that urinalysis remain as an acceptable elective, perhaps fortified if possible by the addition of blood chemistry, to become the equivalent in hours and credit of the course in biochemistry as outlined in the current syllabus.

In our course we attempt to acquaint the student thoroughly with the modern technique involved in the routine examination of normal and pathological urines. The student learns by doing. He examines his own urine to acquaint himself with a normal urine picture. The instructor examines each student's urine to determine whether or not the urine is normal for now and then, a case of an abnormal urine is discovered.

The preparation of diagnostic reagents for the use of physicians is emphasized. Since many physicians conduct chemical examinations of urine in their office laboratories, we feel that the pharmacist should be prepared to furnish the busy practitioner with those reagents which he needs and frequently calls for.

In those qualitative tests, where a reaction has a known chemical explanation, such chemistry is brought to the attention of the student by pointed illustration. Where possible, the reasons for adding this and that, and the explanation of the resulting color or precipitation are carefully outlined and elucidated. Each student is urged to make use of the library facilities and the use of modern textbooks and journals is encouraged for there are assignments which can only be completed outside of class.

From the normal urine, the student is led to the examination of abnormal specimens. Samples of pathological urines are obtained from the laboratory of an associated hospital and occasionally, private physicians submit specimens for both qualitative and quantitative examination. Time does not permit any extensive consideration of microscopic or bacteriological urinalysis. It is the purpose of the course to ground the student in the chemical examination of urine, and to do that well.

While our classes are made up of students who have had preliminary courses in the biological sciences, we review in lecture the anatomy and physiology of the excretory system and briefly touch upon the metabolism of the fats, carbohydrates and proteins in the human body in order that biological activities be understood from the viewpoint of interpretative urinalysis.

While the class meets for sixteen didactic hours and sixteen 3 hour laboratory periods per semester, by rotation of samples each student examines at least one hundred specimens. We consider it a good practice to have the students check each other's results. This makes for a wholesome rivalry. Some students bring in samples of the urines of their friends and delight to "diagnose" the ailments of their friends. The first we encourage, the second, we condemn. The function of the lay analyst of urine is to report findings, not to diagnose disease.

There is also a good natured rivalry with the medical students who are studying physiology and physiological chemistry, and it may be honestly said that our students in pharmacy possess a better understanding of the technique of urinalysis than their fellow students in medicine. In fact, we have had several medical students elect our course as a foundation for future work in junior pathology. Several of our graduates have written to the college wishing to pursue such work as we now give in urinalysis, although appending a desire for comprehensive instruction in blood chemistry.

We attempt to inject the elements of interest in the course from the very beginning. As our students check in their desks we have them take an actual inventory of the supplies and materials furnished them. This gives them an appreciation of the approximate cost of the necessary apparatus for setting up their own laboratories. The cost of preparing diagnostic reagents is also estimated, so that the student may compare the actual cost of preparation with the list price charged by commercial firms. This, we believe, vitalizes the subject with an added interest. The student is inspired with the idea that he may capitalize his professional knowledge by meeting the professional demands of the medical practitioner. And so it should be.

If in the new order of things the young medical practitioner comes to realize that his fellow

pharmacy graduates in the after-graduation era can aid him in the service of the public health, an *entente cordiale* will be established for the mutual good of medicine and pharmacy

Perhaps we may be deluded, but our students manifest an enthusiasm for the work which is most gratifying when many of the major and required courses are considered by them to be necessary evils along the scholastic path to a diploma

A case in point might well be related. One student found that his urine contained a large amount of indican. He admitted to irregularity and a heavy protein diet. From this diet he changed to a vegetable diet containing much roughage. Evidently his experiment must have been very successful for not only did his indicanuria disappear, but his entire physical appearance changed for the better. Often during the stress and uncertainty of examination time, we come across an emotional glycosuria. And with many other conditions of physical and psychic stress and strain we uncover temporary abnormalities by way of urinalysis. These cases are interesting as they point out conditions discussed in the lectures and recitations.

Some students exhibit a desire for the more advanced laboratory methods connected with the clinical analysis of urine. These students are assigned *first*, to library research and *second* the preparation of the more delicate reagents. Where possible these students are given individual instruction in the use and care of instruments of precision employed in urinalysis. It is our policy to allow these students to prepare the reagents in quantity which are to be used by the class. Special meetings are held when discussion of any question pertaining to the subject matter of the course may be entered in by students and members of the faculty. We call these conferences—symposia, and they are most interesting and valuable to all those who attend and take part in them.

In our experience we have found two or three interested students who were fitted for these advanced assignments and it has been our policy to encourage to the fullest extent such interest by a personal participation in the student's problems. In all work of this kind we lay emphasis upon integrity, patience and accuracy.

It has often been said facetiously that a difficult test in a clinical laboratory examination becomes a 'sink test'. That slur upon the laboratorians of our hospitals is slowly dying the deserved death of unrighteous error. In the future, it will be forgotten because of the honest and efficient service of a group of trained men and women, wholly devoted to honest and efficient laboratory analysis as a fundamental and necessary aid to the diagnosis, treatment and prevention of disease.

If it could be possibly arranged a well constructed course in clinical laboratory methods might well be substituted for the present optional course in biochemistry as outlined in the syllabus. This course should be carefully organized, with a view to pointing the lectures and recitations to the utilization of facts in the laboratory. This course should consist of lectures, recitation, conferences and laboratory periods to be equivalent to the number of hours assigned to biochemistry and to receive equal semester hour credit. Blood chemistry as well as urinalysis should be included in the laboratory schedule. The lectures could be so formulated as to include those essential phases of biochemistry of particular value to the content of instruction. This course to consist of 32 didactic and 96 laboratory hours would be an elective to be chosen by those pharmaceutical, medical and special students who had the necessary preparation in the basic chemical and biological sciences.

The writer wishes to give an outline of the course as given at present with a sample examination based upon the lectures, recitations and laboratory work.

1 The Definition and Classification of Urine Examinations

1 Physical 2 Chemical 3 Microscopic 4 Bacteriological 5 Clinical

2 The Normal Urine Picture

3 The Pathological Constituents of Urine

4 Glossary of Terms

5 Qualitative Examination of a Normal Urine for Indican, Creatinine, Dextrose, Urea, Uric Acid, Bile, Blood, Acetone, Diacetic Acid, Chloride, Sulphate, Phosphate

6 Qualitative Examination of a Pathological Urine for Glucose, Creatinine, Blood, Bile, Uric Acid, Indican, Acetone, Diacetic Acid

7 Eight Tests for Reducing Sugar, Differentiation of Glucose, Levulose, Lactose and Pentose

8 Eight Tests for Urinary Albumin

9 Quantitative Examination of Urine for Urea

1 By Hypobromite Method 2 By Urease Method

Ammonia

1 By Schiff Malfatti Method 2 By Aeration Method

Chlorides

1 By Mohr's Method 2 By Arnold Volhard's Method

10 Total Sulphates Total Solids Total Acidity (by Folin's Method) Etheral Sulphates

11 Qualitative and Quantitative Examination of a Sample of Pathological Urine for Blood Bile Acetone Sugar Albumin, Diacetic Acid, Total Acidity Indican, Chlorides, Urea, Uric Acid, Total Solids Total Nitrogen

12 Collection and Preservation of Specimens—Refrigeration, Toluene, Chloroform Thymol etc

13 Clarification and Decolorization of Specimens Talcum Pumice Stone, Magnesium Carbonate, Lead Acetate, Potassium Permanganate etc

14 The Form of Report 15 Questions and Problems

EXAMINATION IN URINALYSIS FOR PHARMACY STUDENTS

1 Outline the normal urine picture

2 What is the significance of a 24-hour urinary output of 4000 cc with a specific gravity of

1.035? 3 Calculate the total solids in the above sample

4 How would you definitely detect glucose in a sample of urine?

5 Briefly give three tests for urinary albumin

6 What is the composition of Esbach's Reagent? Benedict's Solution? Obermayer's Reagent? Fehling's Reagent?

7 How could you determine the amount of urea in urine?

8 Give a test for bile in the urine 9 How would you clarify a turbid urine?

10 Give the test for urinary indican and the chemistry involved

Those who sit for these lectures, who work in the laboratory on many samples, and who pass successfully the examinations given at the end of the course, are fit, we believe, to begin a more advanced excursion into the field of clinical chemistry

Although we may have been unduly negligent of our responsibilities, there comes to us a great comfort, even in our feeling of uncertainty as to the real value of our efforts in teaching a depised and rejected subject

Comes to us the poignant realization that on the front lines of the public health defensive, there are young men and women working quietly and efficiently in the hospital laboratories in the service of medicine as it ministers to the needs of an underhospitalized and underprivileged minority. These servants of the national health received some little training in urinalysis at our hands. Our task in teaching goes on

COMMENTS ON PAPER BY PROFESSOR ANTOINE E. GREENE ON

'TEACHING URINALYSIS TO STUDENTS OF PHARMACY'

BY LOUIS GERSHENFELD *

It is difficult to offer a critical discussion of instruction of the kind you have just received from Professor Greene. To do justice to the subject would require more time than is at our disposal. It is, however, possible to offer certain suggestions and even to ask a question or two in the hope of all of us receiving more instruction

* Professor of Bacteriology and Hygiene and Director of the Bacteriological and Clinical Chemistry Laboratories at the Philadelphia College of Pharmacy & Science

I have been and am deeply interested in the subject which has been reviewed. The retail pharmacist to day falls into several classes. In a rural and suburban store, the pharmacist must have a knowledge of horticulture, agriculture, first aid, and he serves best if he is capable of assisting the medical practitioner at all times and this includes service as a laboratory technician. In small hospitals, pharmacists are frequently required to help as technicians in the laboratory. There are those students in pharmacy who after the first few years of study enjoy and therefore feel that they are especially qualified in laboratory work, and prefer to train themselves along these lines. Even in urban stores especially where professional pharmacy is practiced the chemical laboratory and especially the accurate performance of urinalyses can be of great service to pharmacy and the medical practitioner. In brief we must admit that this is an age of specialization and the pharmacy student who at the end of his career wants to be qualified for certain duties which fit in with the practice of pharmacy should be granted that privilege. Our courses in pharmacy must meet the demands of such branches of study as fit in with the practice of professional pharmacy, and elective courses in the curricula will help this situation very much. I am in full accord with the suggestion of Professor Greene that urinalyses be an acceptable elective and if possible a required subject of study and preferably fortified by other commonly performed chemical laboratory tests. This will fit in with the Applied Bacteriology and Public Health Studies which are required subjects as outlined in the Pharmaceutical Syllabus fourth edition. We find, of course, listed in the latter Biochemistry which is included as an optional subject and herein is to be found a consideration of excretions including urine. It is much more desirable to arrange for a thorough course in urinalyses and other chemical laboratory methods. At our own institution we are giving the latter as a required subject.

Professor Greene's comment is well taken that pharmacists should be prepared to dispense diagnostic reagents. These may be requested by the practitioner, who does his own laboratory work, and in some instances the latter may make inquiries for such preparations. It is not uncommon to find diabetics (especially those using insulin) testing their own samples of urine qualitatively for sugar having received this instruction from their own medical attendants. Such patients don't understand why pharmacists cannot supply Benedict's solution or other reagents. How many drug stores stock litmus paper frequently requested by customers? Many instances could be cited where contacts with medical practitioners were made due to the pharmacist's ability in supplying a diagnostic reagent.

Professor Greene states that "It is the purpose of the course to ground the student in the chemical examination of urine and to do that well." And he further states "Time does not permit any extensive consideration of microscopic or bacteriological urinalysis." Inasmuch as the title of this paper is 'Teaching Urinalysis to Students of Pharmacy' it seems to me that it is important to direct attention to the fact that a careful microscopic study must be made a part of this instruction and as much emphasis should be made upon the value of the microscopic findings as upon the chemical findings. A bacteriological examination is conducted only occasionally but a microscopic examination is and must be at all times part of a routine urinalysis. Despite a most careful chemical examination with or without the finding of abnormal (chemical) constituents a correct interpretation of these chemical findings or the possibility of such urinalyses serving as an aid in diagnosis or prognosis may also necessitate microscopic laboratory aid. A careful microscopic examination should be part of every routine examination and in my own observation and experience, I have found that it is most desirable to give the chemical and microscopic instruction either at the same time or during the same semester. If possible the same instructor may handle both phases of this study, or if need be the microscopical and chemical departments may co-operate. Even in many of the medical schools, there is a lack of proper co-ordination in the instruction as it is presented when the chemical and microscopic examinations of urine are given to the undergraduates. There may even be too much emphasis given to the chemical examination or too little to the microscopic examination. Frequently the medical student is not in a position to learn the interpretation of the combined findings until he is assigned to the laboratory during his internship. In some measure this may account for the fact that entirely too many practitioners who do their own urinalyses merely do the chemical examination and do not carry out a microscopical examination, even though many of them have microscopes. Many examples could be cited to illustrate the above points. There may be albumin found in the sample. This may or may not be of marked significance depending upon the microscopical findings. It is a frequent

occurrence during the warm weather to find samples in transit and not properly preserved revealing an abundant quantity of bacteria most of which developed after the collection of the sample. During transit, it is possible for sufficient albumin to be extracted from the abundant growth of bacteria to give a positive chemical test for albumin. Also there are several chemical entities recognized microscopically by their characteristic type of crystals. Uric acid, triple phosphates, calcium oxalate, leucine, tyrosine and cystine are examples of some crystals which are revealed microscopically and are not detected chemically in urine as tests are not conducted for these in the routine chemical examination. We have fallen into the habit of speaking about the chemical test for blood but you all know that it is in reality a chemical test for hemoglobin, so that this chemical test does not reveal whether we are dealing with a hemoglobinuria (only hemoglobin in the urine) or a hematuria (whole blood in the urine). The latter denotes a pathological condition of the genito urinary tract, while a hemoglobinuria is in most instances the result of abnormalities outside of the genito urinary tract. Whole blood (as found in hematuria) will be revealed not only by a positive chemical test (for hemoglobin), but also by the finding of unruptured red corpuscles microscopically. Pus cells, casts, mucus and other organized cellular elements and evidences indicating disease of the urinary tract may be found upon microscopic examination, when a chemical examination may reveal no abnormalities. Let us remember that if there is some faulty arrangement in the instruction and in the lack of the coordination of the various phases of urinalyses as given to medical students the latter have the added advantage of additional training in a hospital during internship. The pharmacy student does not have and may not receive this added advantage and we who are responsible for seeing that such students are in a position to aid the medical practitioner must be assured that they will do so to the maximum degree.

I agree with Professor Greene that the worker must only report and not attempt to interpret laboratory findings. But at the same time he must be possessed of a rich fund of knowledge not so much to aid in interpreting the findings or to give information as to collection, preservation, etc., when such assistance and information are requested by the practitioner (who makes available other facts which are needed), but mainly because of the fact that the laboratory worker will be in a more favorable position to apply such better judgment in reading the findings revealed after the performance of the laboratory tests.

I think we all agree that it is a difficult task to include all data concerning urine in any course. At the same time an orderly arrangement of the whole subject should be maintained. Though many techniques should be given for the qualitative and even quantitative examination of various constituents the instructor should point out the relative value of the different procedures and the practical importance of the knowledge resulting therefrom. There are many techniques used in hospital laboratories or by Insurance Company examiners when testing samples of urine that are satisfactory for clinical purposes but which would not answer for research study. Yet these are the methods of choice in clinical laboratory practice and it is advisable to consider them. May I add a few additional notations to the outline of Professor Greene on the course as suggested by him the inclusion of which will be helpful.

- 1 A consideration of the frequency of urination and volume voided and factors influencing the latter

- 2 It is assumed, I believe that the physical examination is to include a consideration of transparency and sediments, odor, coloration and pigments, reaction, specific gravity, and the methods employed to report these findings

- 3 Mention is made of tests for urinary albumin. This I assume is to include also a consideration of Bence-Jones protein and proteoses, nucleoprotein, etc.

- 4 Tests for Bile are to include methods for Bile Pigments and Bile Acid Salts

- 5 Mention should be made of the Diazo Substance and the Diazo Reaction, a test still requested by some

- 6 Detection of Inorganic Metallic Poisons in Urine as arsenic, lead, mercury, etc., should be included as this is becoming of greater significance in pathological conditions

- 7 A consideration of tests for kidney function should be given especially mentioning the technique of the Phthalein or Vital Red Test as frequently the samples of urine are sent to the laboratory worker who is requested to determine the quantity of phenolsulphonephthalein eliminated

I have been and am deeply interested in the subject which has been reviewed. The retail pharmacist to day falls into several classes. In a rural and suburban store, the pharmacist must have a knowledge of horticulture, agriculture, first aid, and he serves best if he is capable of assisting the medical practitioner at all times and this includes service as a laboratory technician. In small hospitals, pharmacists are frequently required to help as technicians in the laboratory. PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council" —Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it" And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association "

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates "

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible. Minutes should be typewritten with wide spaces between the lines. Care should be taken to give proper names correctly and manuscript should be signed by the reporter

BALTIMORE

The April meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Hotel Emerson on Monday, April 29th. President Reindollar presiding.

The meeting was preceded by an informal dinner in honor of the guest speaker, Dr. Walter H. Hartung, ten members and their guests were present at the dinner.

The minutes of the March meeting were read by the secretary and approved. President Reindollar then introduced the speaker of the evening, Dr. Walter H. Hartung, director of Research, Sharp & Dohme of Philadelphia.

Dr. Hartung selected for his topic, "Iatrochemistry and Pharmacy in 1935." He stated that in 1935 the old term iatrochemist should be revised to include chemists who are studying the influence of chemical structure upon physiological activity. In a study made several years ago it was pointed out while the U. S. P. V. had only three synthetic drugs the present Pharmacopœia recognizes 130 such compounds. Dr. Hartung pointed out also that many of our most valuable drugs used as antiseptics and anesthetics are pure synthetic compounds.

After an historical review of his topic Dr. Hartung described in detail the interesting work that is going forward in his laboratory on studies of derivatives of propiophenone. During the course of his lecture the speaker elaborated on his discussions by explaining the reactions involved and the structural relationships of the various compounds. He described the first pressor anesthetic as developed in his laboratory and showed the interesting fact that the meta OH group in epinephrine is more important than the para OH group.

Dr. Hartung concluded his talk by discussing the iatrochemistry of mescaline and pointing out recent developments in the study of the sex hormones. Finally a plea was made for a better understanding between the pharmacologist, the chemist and the physician in the clinic.

At the conclusion of the address a general discussion was entered into by the members present. President Reindollar extended the thanks of the organization and called for a rising vote of thanks. About twenty-five attended the meeting. The meetings of the Branch were called off until Fall.

C. JELLEFF CARR, Secretary-Treasurer

NEW YORK

The April meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on April 8, 1935, in the New York College of Pharmacy, Columbia University. About eighty-five members and their guests attended.

After the meeting had been called to order by President Charles W. Ballard, the secretary was called upon for his report which was read and accepted. The treasurer, Mr. Turner F. Currens, reported a balance on hand

Chairman Lehman of the Committee on Education and Legislation, then reported as follows

Federal Legislation—N I R A Senator Pat Harrison's Bill S 2445 on Code Legislation, gives the following powers to the President of the U S in tentative draft of Revised N I R A

- 1 To establish rules of fair competition
- 2 To promote or maintain cooperative organization and action of trade and industrial groups
- 3 To induce or maintain cooperative relations between, or cooperative activities of, labor and management
- 4 Promote or maintain fair competition
- 5 Prevent or eliminate competitive practices which are unfair or destructive of fair competition or restraints upon trade which tend to diminish the amount thereof contrary to the public interest
- 6 Promote the fullest effective utilization of the productive and distributive capacity of trade and industry
- 7 To prevent or eliminate restrictions upon production except those hereinafter expressly sanctioned
- 8 Promote or maintain increased purchasing power and increased consumption of industrial and agricultural products
- 9 Reduce or relieve unemployment or regularize employment
- 10 To establish proper minimum wages and maximum hours of labor
- 11 Improve the standards and conditions of labor
- 12 Promote the rehabilitation of industry
- 13 Conserve natural resources and prevent production or competition wasteful of such resources, and injurious to commerce therein
- 14 To remove unreasonable burden upon or protect the reasonable flow of interstate or foreign commerce

The bill in question refers however to interstate and foreign commerce

It is claimed that the amended law is a tactical admission that most of the Fair Trade provisions in the present Code are unconstitutional (Mr Richberg is given credit for having written this bill)

There are several Anti-Price Discrimination bills before Congress—Mapes Bill, H R 5062, Wheeler Bill S 944 Bankhead Bill S 2211, Huddleston Bill, H R 6618 White Bill, H R 6246

These bills would make it unlawful to discriminate in price of any commodity, regardless of quantity purchased at wholesale

The King Bill S 1923 would legalize reasonable written trade agreements for the regulation of competition similar to the Capper-Kelly Bills

All of these have the support of retail trade organizations, and are an evidence that our lawmakers are beginning to realize that something must be done to save the small distributor

The Black 30 hour bill would limit the working hours in commercial and manufacturing establishments to 30 hours weekly, the bill has been reported out of committee favorably and is on the calendar It is on the Senate calendar for action It is opposed by commercial and industrial bodies

There is a possibility of the Copeland Pure Food, Drugs and Cosmetics Bill S 5 coming up for action soon There are still many objections to the same from various sources which will make enactment difficult

I have here a protest issued by the National Committee of Manufacturers of Cosmetics, objecting to certain regulations as to the labeling of antiseptics

So far, five states besides California have enacted the Fair Trade Law (Junior Capper-Kelly Bill), namely, New Jersey, Washington, Oregon, Maryland and Arizona The Committee on Legislation of the N Y State Pharmaceutical Association is making strenuous efforts to have our bill passed this session of the Legislature the bill is to come up for vote to day April 8th Send telegrams to Senator Dunnigan and to the Assemblyman and Senator of your own district, favoring the passage of the bill

State Legislation — The Assembly has passed the Prophylactic Bill (Stewart int 489) and sent the same to the Senate for action on April 3rd

Delay in legislative action has been due to the rivalry of two Democratic factions in the Metropolitan district in the question of reapportionment also there has been powerful opposition to the Fair Trade bill from department store and price cutter organizations

The N Y Pharmaceutical Council has protested against the raids being made by the Federal Alcohol Tax Unit on drug stores in which it is alleged that untaxed alcohol was found, telegrams were sent to John T Flynn, supervisor of the Alcohol Tax Unit, Secretary of the Treasury, Morgenthau, and Rowland Jones, Washington Representative of the N A R D

Chairman Cosmo Ligorio, of the Membership Committee submitted the association membership application of Mr Stummer for forwarding to Secretary Kelly

Fred Schaefer reported that the question of branch affiliation had been considered thoroughly and that there was no provision which would prevent the Branch from affiliating with the State Association or with the newly organized Council He, therefore, moved that the Branch become affiliated with the State Association and that it should appoint two permanent delegates to the New York Pharmaceutical Council, and appropriate \$10 00 for each delegate, the sum of \$20 00 to be paid to the New York Pharmaceutical Council The secretary asked Mr Schaefer if affiliation would obligate the Branch to have one half of its membership, members of the State Association In answer to this, Mr Schaefer stated that the State Association did have such a requirement for pharmaceutical organizations affiliated with it, but that it would forego this provision and follow a new procedure, of one delegate for the first twenty five state association members and one for each fifty additional state association members during the period 1935 In 1936 the requirement would be one delegate for every twenty five state association members Since there was no further discussion a vote was called and the motion was approved

Dr Hugo Schaefer then submitted the framed life membership certificate given to Dr Fischelis at the time of his recent testimonial dinner This was received by the Branch for forwarding to Dr Fischelis

President Ballard announced that Dr Fischelis president of the AMERICAN PHARMACEUTICAL ASSOCIATION, would address the Branch at its meeting in May and would elaborate on his ideas for consolidating pharmaceutical organizations

A letter announcing the testimonial dinner to be tendered Dr Ernest Little on May 20th, was read by the secretary In commenting upon this, Dr Ballard urged the members of the New York Branch to cooperate Dr Hugo Schaefer suggested that a brief announcement of this dinner be included in the New York Branch meeting notice for the May meeting and also proposed that the New York Branch should try to at least make up one table, if not more He also urged close cooperation with the Northern New Jersey Branch

The application for Branch membership of Prof Peter Conroy was received and favorably voted upon

Secretary Hugo Schaefer, of the Remington Medal Committee, then announced that the Remington Medal for 1935 had been awarded to Samuel Hilton, well known retail pharmacist and association worker, of Washington, D C The secretary was directed to write him a letter of congratulations

No specific plans for the presentation of the medal were discussed and it was suggested that the matter be taken up by the Executive Committee of the Branch

Chairman Leonard Steiger, of the Committee on Progress of Pharmacy, was then called upon for his report which follows

The *Chemist and Druggist* (London 3/23/35) reports on the discovery of a new Ergot alkaloid by Dudley and Moir of the National Institute for Medical Research It has been named 'Ergometrine' and it is found in the B P liquid extract of Ergot In the author's opinion the isolation of Ergometrine indicates that the substance for which ergot was actually introduced into medicine, has been obtained For oral administration ergometrine is described as the essential constituent of ergot extracts

(*Ind Eng Chem, News Ed*, Vol 13, No 7 4/10, 1935) The first Eli Lilly award in Biochemistry goes to Wm N Allen of the School of Medicine and Dentistry of the University of Rochester The basis of the award is the outstanding work done by Dr Allen in developing a sharply defined biological test for the action of *Corpus Luteum*, the use of this test to isolate a po

tent extract, and the complete purification of the hormone, "progesterin" The present knowledge of the solubilities and physical characteristics of progesterin is due to the work of Dr. Allen, who, with R. K. Meyer, achieved the first separation of "progesterin" from estrin.

Thomas N. Fraser in *British Medical Journal* (1934) reports on a fatal case of subacute yellow atrophy of the liver after use of cinchophen. On account of its toxicity the advisability of abandonment of the administration of cinchophen is considered.

Very successful treatment of severe mushroom poisoning with large doses of coramine (*Med. Klin.*, 1934, rep. by C. A., Vol. 29, 1505). Cases of mushroom poisoning in which among other symptoms loss of consciousness, cyanosis and severe respiratory depression have occurred, have responded remarkably to treatment with large doses of coramine. It has been used very successfully also in cases of respiratory depression and failure, during anesthesia poisoning with narcotics and so forth.

Following Mr. Steiger's report, Dr. Ballard introduced the speaker of the evening, Dr. Arno Viehoveer, professor at the Philadelphia College of Pharmacy and Science who spoke on "Evaluation of Cathartic Drugs."

Dr. Viehoveer's address centered about the use of a new test animal for biological standardizations. This small test animal, *Daphnia*, possesses numerous advantages which make its use as a biological test animal particularly advantageous.

The extremely interesting and instructive moving pictures showing the effects of strychnine on the test animal proved ample evidence of the one great advantage, namely the transparency of the animal.

The lecture included numerous demonstrations and lantern slides which added very considerably to the interest of Dr. Viehoveer's address.

The adaptability of the test animal for standardizing drugs of the anthraquinone series such as senna, frangula, rhubarb, cascara and aloë was very well shown in the moving picture films which Dr. Viehoveer presented.

Dr. Viehoveer answered questions relative to the subject. He was given a rising vote of thanks.

RUDOLF OTTO HAUCK, *Secretary*

NORTHERN OHIO

The April meeting of the Northern Ohio Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on the evening of April 12, 1935 at the Faculty Club of Western Reserve University, Cleveland. About forty members and their friends attended.

President Speer called the meeting to order and the report of the secretary was read and approved.

Dr. Lawrence P. Hall, of the research staff of the Mallinckrodt Chemical Works, St. Louis, was then introduced. By means of lantern slides and considerable demonstrating material and interesting specimens Dr. Hall treated the Branch to a very much worth while discussion of the uses of bismuth and its compounds. Some of the high lights of the discussion follow.

Because bismuth is in daily use, we are apt to forget that it is not a common element but actually one of the rarer elements. It is present in the earth's crust to the extent of about one part in ten million.

The bismuth consumed in the world amounts to around 400 tons per year and is obtained from Peru, other South American countries, United States, Canada, China, Australia, etc. The domestic supplies are obtained primarily as a by-product from lead refining. The metal produced in this way is of high purity.

When combined with pure chemicals by properly controlled processes this metal permits the production of pure compounds. The most common ones are the subcarbonate, subnitrate, subsalicylate and subgallate, although various other salts are used such as the oxylchloride, betanaphtholate, subiodide, various organic derivatives such as tartrates, etc.

Bismuth and its compounds have certain peculiar properties which make it desirable for use in industry, in the laboratory, in cosmetics, in dentistry, in radiology, and most important of all in pharmacy. Industrially, bismuth itself, is widely used in low melting alloys which find application in safety devices such as sprinkler heads, links for fire doors, plugs for gas cylinders and boilers, in machine shops for bending thin wall tubing, sealing glass to metal, setting and aligning

dies, molding, soldering, etc., in toys, such as trick spoons and casting outfits for children, and in other surprising and constantly increasing uses. Bismuth compounds are used in producing lustre finishes and glazes on dishes, vases and artificial pearls, in glazes for gold, in dense, refractive optical glass, in luminous paints. Probably high cost prevents more extended use.

The cosmetic use dates from the seventeenth century when Lemery made a fortune from the sale of "Magisterium of Bismuth" for face powder. Bismuth salts have excellent covering power and adhesion but are sensitive to discoloration by hydrogen sulphide and are drying to the skin.

In radiology the introduction of bismuth salts for visualization of the gastro intestinal tract provided the principle for examination of hollow organs of the body. Bismuth compounds have also been used for outlining the bladder, abscesses, fistulas and sinuses.

In medicine, bismuth salts are used topically and systemically. Externally they may be applied as ointment, paste or powder to form a slightly astringent, dry scab which gives mechanical protection and allows rapid healing. Internally they form soothing protective coatings effective in certain gastro intestinal ailments. Systematically various types of bismuth compounds are used hypodermically for syphilis, frambæsia and Vincent's angina.

In these various uses the properties of prime importance to the pharmacist include purity, kind of crystal form, color, light stability, fineness and chemical stability. By way of illustration some lots of the subcarbonate will turn yellow in light, sometimes improperly prepared subnitrate develops excessive acidity and an odor, coarse material will not give usable suspensions. Bismuth salts which are bulky, finely crystalline, pure and stable should give the optimum benefit in pharmaceutical uses.

N. T. CHAMBERLIN, Secretary

STUDENT BRANCH ST. JOHN'S UNIVERSITY

The regular monthly meeting of the St. John's University Student Branch, of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on March 18th. Preceding the meeting a dinner was held at the Lido Restaurant for the members of the Branch, their friends and guests. The meeting was called to order by President Arancio in the College at 8:30 P. M. The reading of the minutes was suspended in deference to the speakers of the evening.

In announcing the subject for the evening's discussion, "What the Physician and the Professional Pharmacist Expects of the Coming Generation of Pharmacists," President Arancio pointed out that many people see a well-defined trend toward professional pharmacy, away from the ultra commercial type of pharmacy.

It was with the idea of stimulating discussion among the members of the Branch on this important topic that the program of the meeting was arranged. Bringing to the future pharmacist the viewpoint of the Physician and the Professional Pharmacist in an open forum of this kind should lead to clearer thinking on many of the problems now facing pharmacy, in this shift to a newer type of professional pharmacy of the future," said President Arancio.

Chairman William Matz, of the Committee on Program, after a few introductory remarks presented the first speaker of the evening, Dr. Thomas B. Wood, well-known Brooklyn physician.

Doctor Wood discussed recent advances in the field of medicine and pharmacy, particularly in the field of Endocrine Therapy. In order to meet the needs of the physician manufacturers had taken it upon themselves to prepare and standardize either chemically or biologically, endocrine preparations in the form of ampuls for intravenous or subcutaneous use. He asked the question "Can a physician depend upon the modern graduate in pharmacy to prepare an ampul containing a sterile solution of glucose in an intravenous emergency?" It is for this reason that manufacturers have availed themselves of the opportunity to prepare such preparations. Doctor Wood expressed the opinion that pharmacists should be prepared to meet the needs of the physician along these lines. He could do this not only by carrying a full line of preparations for parenteral medication but by being ready in case of an emergency to prepare ampuls.

After discussing the evils of substitution and of giving information to the patient regarding the contents or the use of a prescription, Dr. Wood, concluded by stating that the physician expects of the pharmacist of the future: "1. A duly qualified gentleman whose honesty and integrity can be depended upon. 2. To be qualified to prepare special formula tablets and ampuls for intravenous injection, etc. 3. To display the utmost tact in dealing with the patient of the physician. On the other hand the pharmacist should expect of the physician: 1. To adhere, by

and largely to U S P and N F preparations in prescribing 2 To write prescriptions clearly 3 To expect courtesy from the physician when he phones in regard to an incompatible mixture, overdose, etc "

Dr Wood expressed the hope that the future will bring a better understanding between physicians and pharmacists in regard to their mutual problems 'Nothing is more noble,' said Dr Wood "than in aiding in the relief of the sufferer '

Dr Otto Raubenheimer, well and favorably known Brooklyn Pharmacist was then introduced and spoke on the subject of What the Professional Pharmacist Expects of the Coming Generation of Pharmacists "

It is necessary to love your profession,' said Dr Raubenheimer, in pointing out that the practice of pharmacy affords all of the experiences, contacts and conditions necessary for the good life

In commenting on some of the points covered by the previous speaker, he pointed out the difficulties experienced by local pharmaceutical associations in getting physicians to prescribe U S P and N F preparations The speaker then related many personal experiences he had in dealing with physicians and stressed the necessity for tact as well as professional dignity in dealing with physicians In connection with the operation of a professional pharmacy, he stressed the essential need for a library adequate to serve the needs of modern dispensing pharmacy

'The relation between the physician and the pharmacist should be a cordial one and can be made so if each would obligate himself to the ethics of his profession " said Dr Raubenheimer in conclusion

After the speakers had answered several questions by the members, a rising vote of thanks was extended the speakers

ADA J BIZZARI, *Secretary*

A remarkable gathering of various pharmaceutical interests has always marked the annual A P H A Week, because of the unity and understanding of its membership The coordination of these elements has made for the success of the annual conventions The meetings in the different sections of the country have enabled the pharmacists to cooperate for the advancement of American pharmacy

Prescription Department of L S Williams Pharmacy Baltimore

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL AMERICAN PHARMACEUTICAL ASSOCIATION, 1934-1935

Office of the Secretary, 2215 Constitution Avenue, Washington, D C

LETTER NO 14

March 20, 1935

To the Members of the Council

72 *Committee on the Proposed Council on Pharmaceutical Practice* Motion No 24 (Council Letter No 12, page 166) has been carried and Chairman Cook has been advised

73 *Use of the Text of the N F V* Motion No 25 (Council Letter No 12, page 166) has been carried, and Mr Druer has been advised

74 *Year Books for the Library of Congress* No comments have been received on Motion No 26 (Council Letter No 12 page 166) and a vote is called for at this time

75 *Bequest by Dr Frederick B Kilmer* President Fischelis has forwarded a copy of the following letter addressed to him by Miss Josephine I Dooley, Secretary to Dr Kilmer and an executor of his will

Clause 6 of Dr Frederick B Kilmer's will recites as follows

' 6 I give and bequeath unto the AMERICAN PHARMACEUTICAL ASSOCIATION organized under the District of Columbia, the sum of Three Thousand Dollars, to be held in trust the income to be applied to the awarding of a prize for meritorious work in pharmacognosy, such prize to be known as 'The Kilmer Prize' or an equivalent designation In awarding the prize preference to be given to studies in vegetable drugs The recipient of the prize shall be a graduate in pharmacy Teachers in colleges of pharmacy workers in pharmaceutical laboratories, are to be excluded from competing for the prize Prize to be awarded under such conditions as the ASSOCIATION may elect Funds arising from the income which may not be used are to be added to the amount of the prize or added to the principal as the ASSOCIATION may elect "

I give you the above information because it is naturally of interest to your ASSOCIATION Doctor Kilmer, as you undoubtedly know, died December 28, 1934

Under the By-Laws of the Council this communication is referred to the Committee on Property and Funds for recommendation by direction of the chairman of the Council

76 *Report of the Auditor* The following has been submitted

February 11, 1935

Mr C W Holten Treasurer,
AMERICAN PHARMACEUTICAL ASSOCIATION
Washington, D C

Dear Sir

I have made an examination of the books and accounts of the AMERICAN PHARMACEUTICAL ASSOCIATION and your report, as Treasurer, for the calendar year 1934, and beg to report as follows

All receipts have been traced to deposits in banks to the credit of the respective funds for which received, and all disbursements have been found evidence by properly authorized voucher checks

I have verified the cash balance belonging to the various funds, totaling \$28,721 36 and found same to be correct

Investments aggregating a par value of \$139 400 00 have been verified by an examination of the bonds representing these securities All coupons which have not matured as of December 31, 1934 have been found attached to the bonds

The income account of each of the permanent funds, except the Research Fund, and both of the trust funds have been examined and found to be correct. The income account of the Research Fund fails to include six month's bond interest on \$6000.00 U. S. Liberty Bonds amounting to \$127.50. The coupons representing this interest were deposited on February 7, 1935.

During the year 1934 a total capital expenditure of \$78,590.61 was made on account of the construction costs of the Headquarters Building in Washington increasing the cost of this property to \$535,796.07.

Records maintained by the secretary of the Association have been examined and transfers of funds from his account to the account of the Treasurer have been verified.

Respectfully submitted
(Signed) W. A. JOHNSON,
Certified Public Accountant

The treasurer's report for 1934 will be printed in a later issue of the JOURNAL as a part of the Association's records formerly included in the YEAR BOOK.

77 *Sale and Exchange of Liberty Bonds* Under the Second Call, October 15, 1934, and the Third Call, March 15, 1935, the following Fourth Liberty Loan 4 $\frac{1}{4}$ % Bonds, 1933-1938, in the funds named, have been called for payment:

Second Call	October 15, 1934
Endowment, B 01905922 C	\$ 100.00
Centennial, H 04951118 C	100.00
Ebert Prize, 163208 R	1000.00
Research, 30752 R and B 00925702 C	6000.00
Third Call	March 15, 1935
Endowment, 6605 R	\$5000.00
321206 R	500.00
E 00769335 C	1000.00
Centennial, 321207 R	500.00
Ebert Legacy, 364536 R	1000.00
Life Membership, 338207 R	1000.00
364525 R	1000.00
Research, 321205 R	500.00
151885 R	1000.00
Procter 163207 R	1000.00
365087 R	1000.00
F 01886616 C	100.00

The following letter has been received from Chairman Philip of the Committee on Finance:
Dr. Charles H. LaWall, under date of March 18th, has written me as follows:

'I agree that the capital relieved by the calling in of U. S. Fourth Liberty Loan Bonds owned by the A. P. H. A. be reinvested in the U. S. Treasury Bonds of 1955-1960, bearing 2 $\frac{7}{8}$ % interest.

Therefore, two of the three members of the Finance Committee approving this exchange of bonds, I ask that you take such steps as are necessary to sell the present bonds and buy the new ones.

If a motion to the Council is necessary for this step, I so move.

This communication answers your letter of March 19th, with enclosure from Henry Morgenthau, Jr., Secretary of the Treasury.

There has been called to my attention, the Home Loan Bonds, that pay a better rate of interest. These bonds are, as those favoring the purchase of them express it, 'a moral obligation of our Government.'

It is my opinion that the higher rate of interest, while desirable, should not defer us from considering the greater safety of the bond the Committee suggests purchasing. Security of principle during these trying times for money entrusted to our care is the first and most important consideration."

It will be necessary to transfer two thousand dollars of the accumulated interest in the Life Membership Fund invested in the above bonds, to the Current Fund

(Motion No 28) *It is moved by Philip, as Chairman of the Committee on Finance that the called Fourth Liberty Loan Bonds listed above be sold and that the proceeds be invested in U S Treasury Bonds 2 7/8%, 1955-1960, or that the bonds be exchanged on an even basis, and that since most of the called bonds are registered, and as this form is required the following be re adopted (see JOURNAL, A PH A, Dec 1933 pages 1302-1303)*

Resolved, that C W Holton, treasurer, and E F Kelly secretary, are here by authorized to buy, sell deal in, assign or negotiate the called Fourth Liberty Loan Bonds which are owned by, or registered in the name of, the AMERICAN PHARMACEUTICAL ASSOCIATION and to that end, to endorse transfer and deliver the same

By direction of the Chairman of the Council a vote on this matter is called for at this time, as the exchange cannot be made after March 27 1935

E F KELLY, Secretary

NORTHERN NEW JERSEY BRANCH, A PH A

The Northern New Jersey Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION held its second annual Physicians Night as its April meeting, on April 15th. Due to the development during the year of the New Jersey Formulary the greater part of the evening was devoted to a discussion of this important project. William Richert of Elizabeth addressed the physicians and pharmacists on the work from the viewpoint of the pharmacist and Dr H B Wilson of Hackensack, discussed the physician's views.

Dr Hans Molitor, director of the Merck Institute of Therapeutic Research addressed the meeting on the subject, "Therapeutic Research and Its Relation to Pharmacy, Medicine and Chemistry" in which he explained the objects of research in developing new drugs, justifying the use of old drugs, and in developing new uses for old drugs.

SECTION ON PRACTICAL PHARMACY AND DISPENSING

Due to the fact that the convention date of the ASSOCIATION is in the early part of August instead of the latter part, it will be necessary for those interested in presenting papers to this Section to submit the title and a short abstract, to the secretary several weeks earlier than the usual time. Every one interested in the work of this Section is invited to take part and asked to forward all titles and abstracts to the secretary as promptly as possible.—HENRY M BURLAGE *Chairman* L W RICHARDS *Secretary*, School of Pharmacy University of Montana Missoula, Montana

While the foregoing has been inserted by the

officers of the Section on Practical Pharmacy and Dispensing, it applies to all Sections and Conferences. For officers—see the roster in this issue of the JOURNAL.

PHARMACEUTICAL SERVICE IN THE ARMY

Representatives of the AMERICAN PHARMACEUTICAL ASSOCIATION, The American Association of Colleges of Pharmacy and the National Association Boards of Pharmacy met in Washington on April 5th and 6th to continue the joint efforts to improve the pharmaceutical service for the Army and to secure better recognition for pharmacists by improving their status.

Plans to broaden the work of army pharmacists were considered. Visits at the invitation of the Surgeon General were made to the hospitals at the Medical Center and at Fort Myer. The pharmacies at those hospitals and the work carried on in them were carefully inspected. A conference with Surgeon General Patterson and Colonel McDonald was held during which proposed legislation looking to a commissioned rank for army pharmacists was discussed.

It is expected that a similar joint committee meeting will be held in Washington during June or July and that an encouraging report of progress can be made at the Portland Oregon meeting, August 5th-10th. The efforts to secure a satisfactory status for pharmacy in the Army and the Navy have been interrupted by the reductions affecting these services during the depression. This work is being taken up aggressively again and when a satisfactory program is worked out the national, state and local associations will be informed and their coöperation requested.

EDITORIAL NOTES

KENTUCKY FARM FOR NARCOTIC ADDICTS

The \$4,000,000 00 narcotic farm established by the Federal Government in the heart of Kentucky's blue grass country for the segregation and rehabilitation of narcotic addicts will be dedicated May 25th, by Surgeon General Hugh S. Cumming.

Construction of the huge plant, which covers eleven acres in the centre of a 1000 acre farm tract acquired by the government, began in the Spring of 1932. A similar institution is being erected at Fort Worth, Texas.

Efforts will be made to restore to health and train to be self supporting and self-reliant those who are admitted. Experiments will be carried on to determine the best methods of treatment.

The farm staff will number several hundred with an annual payroll of slightly less than \$500,000 00. Additional operating costs will bring the yearly cost to about \$750,000 00.

A REPORTED POISONING CASE

A case of poisoning in Brooklyn reported in the press is now before the Grand Jury, hence names are not mentioned. References to a married man whose wife and three children died between the last of March and middle of April. The Police Department in Brooklyn struck by the coincidence, had post-mortem examinations made and thallium was found in the viscera. Chemical analysis by spectroscopy revealed the presence of thallium, not only in the viscera but in some cocoa. However ordinary chemical analysis failed to detect thallium.

Mention is made because of the article in this issue by James C. Munch.

CHIEF OF THE BUREAU OF MEDICINE AND SURGERY

By an act of Congress March 3, 1871, it was provided that the chiefs of the bureaus of medicine and surgery provisions and clothing, steam engineering and construction and repair shall have the relative rank of commodore, while holding said position and shall have respectively the title of surgeon general, paymaster general, engineer in chief and chief constructor. The first to bear this new title of Surgeon General though the fifth to hold office as Chief of the Bureau of Medicine and Surgery, was William Maxwell Wood of Maryland.

PHARMACEUTICAL MUSEUM FOR MOSCOW

The *Pharmaceutical Journal* of April 27 1935 states that a pharmaceutical museum has been opened in Moscow. The first dispensary in Russia was founded by the English pharmacist Jameson French in 1651 but it was intended exclusively for the service of the Tsar, his family and members of the Court. In 1675 a second crown pharmacy was opened in Moscow, and this was empowered to supply medicines to the public. The following year in 1701 Peter I ordered the opening of eight chemists shops in Moscow. At the present time Moscow possesses ninety eight chemists' stores, but over 50 per cent of the prescriptions are dispensed by Moscow's three pharmaceutical factories. In 1923 817,000 prescriptions were dispensed in Moscow. In 1933 they made up 4,700,000.

VITAMIN "A" AND "D" PRODUCTS

The Food and Drug Administration has received numerous inquiries about the proper labeling of products represented to contain vitamins A or D or both.

Many products compare their vitamin A and D potency with a stated volume of cod liver oil. If statements of this character are made, they should be literally true. For example if the label of a medicine states "Each tablet equals one teaspoonful of cod liver oil in vitamins A and D potency" it should contain the same number of vitamin A and D units as would be contained in not less than 4 cc (3.67 Gm) of cod liver oil, of U. S. P. potency. In terms of the U. S. P. standard for cod liver oil which became official on January 1, 1935, this would require each tablet to contain not less than 2200 units of vitamin A and not less than 312 units of vitamin D.

Manufacturers should state vitamin A and D potencies in terms of the new U. S. P. units. Because differences in the clinical efficacy of vitamin D from different sources have been reported, it is desirable, and in many instances necessary in order to meet the requirements of the Federal Food and Drugs Act, to state the source of the vitamins A and D. For example, "From cod liver oil." All direct and implied claims comparing products of this sort with cod liver oil should be true in terms of the new standard for cod liver oil.—W. G. CAMPBELL, *Chief*

PERSONAL AND NEWS ITEMS

The *Southeastern Drug Journal* devoted a number of pages of its May issue in honoring Dr James H Beal

The frontispiece of these pages is a half tone of the honored member Among the tributes the first is that of the Florida Pharmaceutical Association presented by its president Don S Evans, the State Board of Pharmacy, by W M Hankins the University of Florida by Dorn Townes R Leigh, The Traveling Mens Auxiliary, by its president Rush St John the officers of the State Association by Max S Adler, Secretary G H Grommet, Victor Wray, C G Hamilton W E Fossett, E P Purcell, Wm R Einrich John K Clemmer J K Atwood, and the wholesale industry of Florida by H C Shuptrine and F C Groover

A testimonial dinner was tendered Dean Ernest Little on May 20th, honoring him for his services to Pharmacy Recognition was given to the various services rendered by the Dean and notably this year fulfilling the office of president of the American Association of Colleges of Pharmacy The dinner was well attended and a delightful and interesting program carried out under the direction of a committee of members of the A Ph A Branch Rutgers University, local and state organizations and other friends

Former President A Pir A Robert L Swain, Deputy Food and Drug Commissioner for Maryland, has been reappointed to the Maryland Board of Pharmacy At the commencement exercises of Washington College Chestertown, Md the degree of doctor of laws will be conferred on him and also on Dr John H Rowland, dean of the Medical School of the University of Maryland

Col Charles Ransom, Medical Corps, succeeds Major General Robert U Patterson as Surgeon General, the term of the former expiring May 31, 1935

Z C Lewis, Montgomery, has been appointed secretary of Alabama Pharmaceutical Association

Paul C Olsen recently made a factual study of the results of stabilization in a typical city retail drug store A second of a series of investigations to determine from actual facts just what profits drug store proprietors are really obtaining on products on which price stabilization policies have been announced and on those not announced is being studied and reports may be obtained from Secretary E L Newcomb, N W D A

The Library Facilities of Washington lists the library of the AMERICAN PHARMACEUTICAL ASSOCIATION

Boericke & Tafel homeopathic pharmacists, of Philadelphia and New York are celebrating the conclusion of the first century of this establishment which later added other branches

The *Scientific Bulletin* published by Laboratorio Quimico Central City of Mexico of April 15th carries a news item, advising that Secretary A L I Winne, Virginia Board of Pharmacy, visited in the City of Mexico The *Bulletin* thanked E G Eberle for advising the staff of Mr Winne's visit and welcomes members of the AMERICAN PHARMACEUTICAL ASSOCIATION Director G G Colin has been a member of the ASSOCIATION for a number of years and is chairman of the Membership Committee for Mexico

A distinctive professional window display has been designed by Merck & Co, Inc, for distribution to retail pharmacists who desire to feature their prescription service to the public This attractive five piece lithographed presentation is intended to portray the professional alliance of the physician, the pharmacist and the manufacturing chemist in promoting health and combating disease

The *Mississippian* of recent date featured the School of Pharmacy of which Prof E L Hammond is dean

In a booklet of "Architects and Sculptors of the Principal Buildings and Monuments in Washington, that of the AMERICAN PHARMACEUTICAL ASSOCIATION is listed and John Russell Pope as the architect The latter is also credited with the Archives Building, Theodore Roosevelt Memorial, Strauss Memorial, Constitution Hall and Scottish Rite Cathedral

Secretary E F Kelly was a speaker at the Illinois Pharmaceutical Association held at Quincy during the week of May 21st his subject being—"The Value and Defects of the Retail Drug Code," Samuel C Henry spoke on "Problems Facing the Drug Trade" W Bruce Philip was a guest at the Chicago Veteran Druggists Association

John C Emerson, Joplin, is the new president of Missouri Pharmaceutical Association, and Kenneth Nichols, of Jefferson City, is the new secretary

The *Pharmaceutical Journal* Great Britain, expressed its loyalty and congratulations to King George in the Silver Anniversary edition of May 4th

Among recent visitors at the American Institute of Pharmacy are the following Ernest L Cushing, Charlestown, Mass, Samuel A Weiss New York City, Dr Arthur E Kennelly, Harvard University, Dr C M Judd Rochester, Minn, Charles E Lyman, New London, Conn, Ralph P White, Youngstown, Ohio, Dean R A Lyman Lincoln, Neb, Dean Ernest Little, Newark, N J G T MacDonald, Shelburne, Nova Scotia, Sam E Welfare, Winston-Salem, N C, A J Du Plessis, Middleburg C P, South Africa,

OBITUARY

LAWRENCE S WILLIAMS

Lawrence Soper Williams, member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1910, died April 25th, aged 48 years, after an illness of six weeks.

Mr Williams was a pharmacist in devotion and action who had pride in his profession and

L S WILLIAMS

gave patrons and physicians a better appreciation of pharmaceutical service and is expressed in his address before the Section on Practical Pharmacy in Washington and published in this number of the JOURNAL. His loyalty and enthusiasm were emphasized in an address at the Washington meeting when he was represen-

tative of his classmates and in the presentation made of a wonderful collection of show globes and other museum material (See June JOURNAL, 1934, page 608 and in September issue page 947) These words speak in part for the pharmacist, who was always ready to espouse the cause of pharmacy and had pride in his profession, evidenced by precept and example.

Mr Williams served as president of the Maryland Pharmaceutical Association in 1930 after having been third second and first vice president in successive years. After his term as president he was a member of the executive committee. For more than twenty years he had conducted his pharmacy at Caroline and Preston Streets Baltimore. He started his collection of show globes many years ago and added to these balances, mortars and other collections, and a large selection of these are on permanent display at the American Institute of Pharmacy and expressive of his devotion—a gift to the ASSOCIATION.

The deceased was born in Baltimore, attended the public schools here studied at Baltimore City College and the University of Maryland School of Pharmacy.

Surviving are his widow the former Ida Exall and three children Marguerite, wife of Dr Albert E Sikorsky and Sarah Williams and Lawrence S Williams, Jr.

Mr Williams was a member of the Masonic Order, the Old Town Merchants and Manufacturers' Association and the Baltimore Retail Druggists' Association, in which he had been an officer.

ROBERT R LAMPA

Robert R Lampa, member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1892 died at his home in Teaneck, N J, April 29th, aged 72 years.

Born in Germany, Mr Lampa came to this country with his parents, and at the age of fifteen obtained a position as errand boy for Leln & Fink. He studied at night at Cooper Union and later at Columbia University, graduating from both institutions. He went successively into the botanical, drug and chemical departments of the firm, and then was taken into the office as city salesman. After a few years he was made New England representative and served in this post until he was elected vice president. He retired several years ago to devote his time to his pet hobbies of literature and the sciences generally. He published a book of poems called 'Stardust' and for many years was poet laureate for the New York Veterin Druggists' Association of which he had been president twice.

JOHN P SCHOENTHALER

We are just advised of the death of our fellow-member John P Schoenthaler of St Louis on February 19th aged 73 years. The deceased affiliated with the AMERICAN PHARMACEUTICAL ASSOCIATION in 1901.

HON CLYDE KELLY

The unfortunate death of Hon Clyde Kelly of Pennsylvania, on April 29th is a severe blow to all those who hope for Federal legislation to prevent unfair trading. Congressman Kelly believed implicitly in the benefits to be derived from the legislation known as the Capper Kelly Fair Trade Bill. He thoroughly understood the principles of this legislation and argued eloquently and worked hard in its behalf. The Capper Kelly Bill, of which he was co author with Senator Arthur Capper of Kansas, came near to carrying out the realization of his boyhood ambition and aim.

It was due to Congressman Kelly's leadership and sagacity that the NIRA was so framed that limited price stabilization was possible. To the independent retailer his devotion to fair trading endeared him to their hearts. That which can be done best to perpetuate his memory is for every independent retailer and for all drug organizations to fight on aggressively and have Congress pass the legislation that he fathered.—From *W Bruce Phillips Bulletin* April 30 1935

DEATH OF DR WILHELM KOLLE

Dr Wilhelm Kolle privy counselor and director of the State Institute for Experimental

Therapy and of the Chemiotherapy Research Institute, George Speyer Haus at Frankfort died in Wiesbaden, May 10th, after a long illness at the age of 66.

In 1893 Dr Kolle entered service of the Robert Koch Institute for infectious diseases in Berlin. By order of the State Government he directed a scientific expedition in South Africa from 1897 to 1899 studying the treatment of leprosy and rinderpest. He was sent on a similar mission to the Sudan by the Egyptian Government in 1900.

He was appointed professor of Bacteriology at Bern University in 1906. He succeeded Paul Ehrlich as director of the Frankfort Institute in 1915. For a long time he was a member of the permanent standardization commission for therapeutical and bacteriological medicine of the League of Nations hygiene committee.

At his death Dr Kolle was working on elaborate scientific plans particularly connected with cancer research.

CANADIAN HEALTH INSURANCE

According to the *Canadian Pharmaceutical Journal*—on the Commission which Canada proposes to set up there must be a place for the pharmacist, who is one of the health factors in the community. In England under a National Health Insurance he has a definite and responsible position and is recognized in the scheme of things. In the various provinces are established Schools of Pharmacy to educate young men to have a knowledge of drugs and medicines and their compounding. The service the pharmacist renders the community in case of sickness is immeasurable. The diploma hanging on his wall is a guarantee of competency in compounding drugs and we feel sure that the Hon Dr Sutherland will include the pharmacist among his appointees to the Royal Commission which he proposes to set up to inquire into State Medicine and Health Insurance.

The *American Professional Pharmacist* has succeeded the *Practical Druggist* the Editorial Board is composed of Reginald E Dyer A O Mickelsen, John L Dandreau and C Leonard O Connell.

Make arrangements early to attend the Portland A Ph A, meeting

SOCIETIES AND COLLEGES

AMERICAN COUNCIL ON EDUCATION

The 18th annual meeting of the American Council on Education was held in Washington, May 3-4, 1935. As members of the Council, the American Association of Colleges of Pharmacy was represented by Dean Ernest Little of Rutgers and Dean Rufus A. Lyman of Nebraska. Among the speakers of the meeting known to pharmacy Dr. W. W. Charters delivered an interesting address on "The Motion Picture in Education." The long list of addresses and papers dealt with educational subjects in various phases. Director-Emeritus Dr. Charles Riborg Mann was honored at a dinner presided over by Dr. Frederick B. Robinson of the College of the City of New York.

The American Council on Education was founded in 1918 by prominent educators representing a majority of the national educational associations.

BALTIMORE AND D. C. VETERANS' ASSOCIATIONS

The annual joint outing of the fraters of the Veterans' Associations of Baltimore and the District of Columbia was held at Olney Inn, May 8th. A beautiful day induced a large attendance. Ladies graced the occasion.

NATIONAL CONFERENCE OF PHARMACEUTICAL RESEARCH

Chairman E. N. Gathercoal has addressed the members on the meeting of the National Conference on Pharmaceutical Research at Portland, August 3rd. The annual survey and proceedings of last year were referred to in the February JOURNAL on page 177. Chairman Gathercoal hopes for a large attendance and an interesting program.

He refers to the pharmaceutical tour from Chicago to Portland and return, references to which are made in the April JOURNAL and also in this issue.

CENSUS OF RESEARCH 1934-1935

Dr. James C. Munch, 40 North Maple Ave., Lansdowne, Pa., desires prompt information relative to research being conducted in laboratories and by individuals. In making the report to him the name of the reporter should be given, the laboratory address, the field of investigation and the subject or subjects under investigation. Prompt replies are requested.

GEORGE WASHINGTON UNIVERSITY FELLOWSHIPS

The School of Medicine of George Washington University announces the acceptance of several grants for various research projects as follows: From the Rockefeller Foundation the sum of \$25,500.00 in support of studies in the department of biochemistry; a renewal of the Kane Kotz Fund of \$1700.00 for studies on clinical endocrinology in the department of obstetrics and gynecology from the Eli Lilly Co. the sum of \$1200.00 for a fellowship in biochemistry and a grant of \$1800.00 for the study of the post-pituitary hormones from Parke, Davis and Company.

AMERICAN PHARMACEUTICAL MANUFACTURERS' ASSOCIATION

The American Pharmaceutical Manufacturers' Association will meet at Hershey, Pa., June 3rd-6th, in the foothills of the Blue Ridge Mountains overlooking Lebanon Valley.

AMERICAN DRUG MANUFACTURERS ASSOCIATION

The Wagner bill was a subject of considerable discussion and opposition at the annual meeting of the American Drug Manufacturers' Association at Hot Springs, May 6th to 9th. The executive committee was of the opinion that the Copeland bill required amendment. Tariff bargaining received much attention, the director of Foreign and Domestic Commerce addressed the convention on this subject.

The reports of the officers and of the standing committees conveyed timely and useful information on matters relating to the drug industry and the members of the association in particular.

The annual election resulted in naming the following officers for the ensuing year:

President A. C. Boylston, St. Louis, *First Vice President* Oscar W. Smith, Detroit, *Second Vice President*, John F. Anderson, New Brunswick, N. J., *Third Vice President* L. N. Upjohn, Kalamazoo, Mich., *Executive Vice President and Secretary*, reelected by the executive committee, Carson P. Fraley, 506 Albee Building, Washington. *Treasurer*, S. DeWitt Clough, North Chicago, Ill., *General Counsel* Horace W. Bigelow, Detroit.

MARYLAND AND DISTRICT OF COLUMBIA ASSOCIATION

The Maryland and District of Columbia Pharmaceutical Associations will meet in Baltimore, June 25th-28th

WEST VIRGINIA UNIVERSITY

Students of West Virginia University, Department of Pharmacy, toured May 5th in a caravan of six cars to visit the plant of Parke Davis & Co., in Detroit. The group was accompanied by Prof. and Mrs. J. Lester Hayman.

MINNESOTA ASSOCIATION

The following results of the recent mail ballot of Minnesota Pharmaceutical Association have been announced: *President* Roy G. Paulson, Fairmont, *Vice Presidents*, Jesse B. Slocumb, St. Paul, Orlando Didra, Waseca, and L. M. Herbert, Worthington, *Secretary*, A. Roy F. Johnson, *Treasurer* Charles T. Heller, Jr., St. Paul, *Executive Committeeman* Joseph Vadheim, Tyler.

KANSAS ASSOCIATION OFFICERS

Kansas Pharmaceutical Association met in Wichita, April 9th to 11th, the following officers were elected: *President* A. H. King, Manhattan, a member of the State Board of Pharmacy for nine years, *First Vice President*, Percy S. Walker, *Second Vice President* Paul Schultz, Beloit, *Treasurer*, Walter Varnum, and Dean Havenhill. Lawrence was renamed librarian.

It is contemplated to urge the use of the funds of the State Board of Pharmacy to underwrite the publication of the "History of Pharmacy in Kansas," by Matt Noll.

GOLDEN ANNIVERSARY MEETINGS

The Chicago Retail Druggists Association has held its 50th anniversary meeting. A most interesting program was provided and carried out and a special edition of the *C R D A News*, May 4th, was issued. The celebration took place at College Inn Hotel Sherman and was participated in by the members and representatives of national, state and local organizations. The Jubilee banquet was held on May 9th.

Tennessee Pharmaceutical Association will celebrate its 50th anniversary July 15th-18th in Memphis. Elaborate preparations are made for the event under direction of Chairman Ed Sheely.

U S P AND N F PUBLICITY COMMITTEE, MARYLAND

The sixth group of prescriptions has been mailed to Maryland physicians under the direction of Chairman Marvin J. Andrews. These comprise preparations for Dermatitis, Anti-Pruritic Lotion, Insect Skin Lotion, Poison Ivy, Acne, Prickly Heat Lotion, Burns, etc. Criticisms and suggestions are invited and the work has been eminently successful.

IMPROVED METHOD CUTS COST OF MAKING CALCIUM GLUCONATE

A cheaper and faster method for making calcium gluconate, commonly prescribed for expectant mothers and others who need calcium, was reported April 23rd, before the American Chemical Society in New York City, by H. T. Herrick, R. Hellbach and O. E. May, chemists of the U. S. Department of Agriculture.

The discovery is based upon a more efficient use of molds as fermentation agents. Molds have been used for centuries in the manufacture of Roquefort and Camembert cheese and more recently for making citric and gluconic acid.

Six years ago Herrick and May discovered a mold that produces gluconic acid from glucose or corn sugar. This acid is important in the manufacture of calcium gluconate, which until that time sold for about \$150.00 a pound. When this pure culture mold was put to work making gluconic acid the rare chemical could be made for 50 cents a pound. The improved process now cuts the cost still more.

Because molds must have air—the same as most other forms of plant life—the chemists grew them on the surface of shallow pans in the laboratories of the Bureau of Chemistry and Soils, at Arlington Farm, Va. The method can be adapted to commercial use but the necessity of using large pans has been a decided handicap in large scale operations.—Information from the U. S. Department of Agriculture.

Dr. Howard B. Lewis, director of the College of Pharmacy of the University of Michigan and professor of physiological chemistry in the Medical School, has been elected a member of the National Board of Medical Examiners of the United States, to succeed the late Professor Otto Folin of Harvard University.

LEGAL AND LEGISLATIVE

CODE MEETING

A meeting of delegates representing various codes was held in Washington, Constitution Hall May 22nd. The urgency of continuation of the NRA for a period of two more years was voiced and the progress made under present conditions, even though largely imitative, was generally voiced.

Steps were taken to impress the continuation on Congress.

STATE LEGISLATURES

The following legislatures are still in session: Alabama, California, Connecticut, Florida, Illinois, Massachusetts, Michigan, Missouri, Nebraska, New Hampshire, New Jersey, North Carolina, Ohio, Pennsylvania, South Carolina, Texas, Wisconsin; other states had no sessions or have adjourned.

FOOD AND DRUG BILL

An agreement is said to have been reached by Senators Royal S. Copeland and Josiah W. Bailey. The principal matters involved in the agreement include:

- 1 A separate definition for devices, removing them from classification as drugs
- 2 A definition of scientific opinion
- 3 A variations clause similar to that in the present law
- 4 False advertising to be classed as misbranding instead of adulteration
- 5 Liberalization of the definition of "germicide"
- 6 A more restricted provision for factory inspection
- 7 Multiple seizures prohibited in charges of misbranding except where imminently dangerous to health and provision for consolidating multiple seizures for a single trial
- 8 Specific provision that no power is taken from the Federal Trade Commission

NATIONAL RECOVERY
ADMINISTRATION

At a conference, on May 16th, with the National Industrial Recovery Board the President approved the following recommendations which had been unanimously adopted by the Board and submitted to him:

- 1—*Two year extension* This time is necessary to obtain the cooperation of industry in

the formulation of codes, with assurances to management and labor of reasonably permanent conditions. It is necessary code administration to strengthen enforcement through judicial approval of methods, and to prevent the entire breakdown of labor and fair trade practice provisions by chiselers who are already at work undermining the standards of fair competition. The extension of NRA for a few months will bring rapid deterioration and disintegration of the whole industrial recovery program.

2—*Adequate period for the revision of codes*—three to six months

3—*Improved statement of legislative policies and standards* to give additional guidance and authority for administrative action

4—*Jurisdiction of NRA limited to industries engaged in, or SUBSTANTIALLY affecting interstate commerce*. This will prevent the NRA from taking in too much territory and will strengthen its legal authority.

5—*Provision for voluntary codes and adequate authority for imposition of limited codes*. Both are necessary. Voluntary codes to encourage improved business practices, including appropriate labor provisions. Limited codes to insure minimum wages, maximum hours, prohibition of child labor and Section 7(a).

6—*Definite authority and standards for the NRA to prevent unfair competitive practices* especially those tending to monopoly and destruction of small enterprises.

7—*Methods of code making and enforcement should be further defined*, with enforcement primarily through injunction or cease and desist orders, and with provision for adequate protection of individual rights and small enterprises through opportunity for hearing and judicial review and public control of all compulsory processes.

MARYLAND LEGISLATION

The *Maryland Pharmacist* defines and explains new Maryland legislation. The Gross Receipts Tax—the accounts received are for purposes of unemployment relief and old age pensions. Drug Store Permit Law—Under this law no person copartnership, association or corporation may operate, maintain, open or establish any pharmacy in this state except under a permit issued by the Maryland Board of Pharmacy.

Permits are required for the manufacture of drugs, medicines etc

All false and misleading therapeutic claims are barred from the label of all drugs and medicines

Poison Law—This law repeals the Old Poison Law enumerates the poisons, defines labels, the law deals only with sales at retail Drug Store Inspection Law—Under this law every drug store must possess the later revisions of the U S Pharmacopœia and National Formulary and must be properly equipped

The Maryland Board of Pharmacy and the State Department of Health are given power to inspect all drugs and medicines manufactured or sold within the state, and to inspect during business hours any pharmacy or other place where drugs or medicines are manufactured or kept for sale

Barbital Law—This law prohibits the sale of barbital trional etc except on prescriptions Pure Food and Drugs Act adds labeling and misrepresentation clauses Patent Medicine shows and unsafe sampling are prohibited under House Bill 604

The State Narcotic Law repeals the old State Narcotic Act and replaces it with an improved version of the Uniform State Narcotic Act The records under the Federal Narcotic Act are expressly adopted under the State Act

The foregoing are very brief statements abstracted from the report referred to

RESTRICTIONS ON SALES IN OHIO

Acting within its authority to issue regulations and extend the list of drugs confined to sales by registered pharmacists the Ohio State Board of Pharmacy has made material additions to its list of drugs which cannot be sold through general merchants The list comprises more than 200 items

Columbus, Ohio—The Ohio State Pharmaceutical Association and the Ohio Board of Pharmacy are objecting to a provision in the bill which permits doctors to dispense a maximum of four grains of opium or its equivalent in other narcotics without prescription

JAPANESE SCHOOLS OF PHARMACY

Dr Yoshio Sugu, dean of the Women's Department in the Tokyo College of Pharmacy, was appointed the head pharmacist of the hospital attached to the Hokkaido Imperial University, and his former post is now occupied by Professor Shichiro Akiya of the same college The Tokyo College of Pharmacy is

situated at Ueno Sakuragi-cho, Shitaya 1u Tokyo

The American Association of Colleges of Pharmacy was accepted as an associated society of the American Association for the Advancement of Science

CONGRESS OF PHARMACY

The Congress of Pharmacy, as before stated convenes in Brussels, July 30th to August 6th

A program of the papers which are to be submitted to the Scientific Section of the International Congress of Pharmacy has been published in the *Journal de Pharmacie de Belgique* Among the papers to be presented are the following

Prof J H Burn on "The Standardization of Oestrin and Male Hormone," H Berry on 'The Stability of Strophanthin Solution,' T E Wallis on 'Structural Standards for Crude Drugs," Dr W H Linnell on 'Halogen Analogues of Ephedrine and Adrenaline," A La Grange and N Wattiez 'A Critical Study of the Methods of Assay of the Alkaloids in the Official Preparations of Belladonna in the Belgian Pharmacopœia 1930,' A J J Van der Velde, 'Research on the Sterilization and Biochemical Control of Pharmaceutical Products," Prof Herrmann and Monsieur Hebert, 'Criticism on the So-called Chemical Reactions of Cannabis Indica,' Monsieur Snejko's 'The Problem of Unifying Pharmaceutical Nomenclature in an International Pharmacopœia "

On Saturday and Sunday, August 3rd and 4th, the Congress goes to Antwerp to celebrate the centenary of the Societe de Pharmacie d'Anvers and closes officially on August 5th

FAIR TRADE LEGISLATION

California, Iowa, Maryland, New Jersey, New York Oregon Washington, Wisconsin enacted a Fair Trade law Alabama Connecticut Indiana Michigan Minnesota Montana Nebraska, Nevada Oklahoma Pennsylvania South Dakota, Texas, Utah Wyoming introduced fair trade bills

George A Bunting entertained members of the Baltimore Veteran Druggists' Association at his home for those whose birthdays were celebrated in April among them, the host, Frank C Purdum, A G DuMez and William G Lauer

Make arrangements early to attend the Portland A Ph A, meeting

THE PORTLAND MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The following paragraphs are culled from the letters of President R. P. Fischelis and Local Secretary A. O. Mickelsen.

'In less than three months the AMERICAN PHARMACEUTICAL ASSOCIATION will hold its Eighty Third annual meeting at Portland Oregon. For the first time in its history the ASSOCIATION has selected the Pacific Northwest as its center of activities for the week which is annually devoted to planning the major activities of American Pharmacy for the ensuing year. Much has occurred since we met in Washington, D. C. to dedicate the Headquarters Building, and the officers and committees will have reports to present at the annual convention which will be full of important and valuable information both from a scientific and a practical standpoint.'

The State Pharmaceutical Associations of Oregon, Washington and Idaho will hold a history making tri-state convention in Portland August 4th to 6th, which will add greatly to the interest and attendance of the A. P. H. A. convention.

"The Bonneville Dam, a \$32,000,000.00 project, will be visited by A. P. H. A. delegates on Saturday, August 10th, when they will be taken up the world-famed Columbia River Highway for an all day scenic drive and luncheon featuring famous Columbia River salmon. No other section in the world could duplicate this pleasure trip."

DETROIT BRANCH A. P. H. A.

The College of Pharmacy, University of Michigan and the Detroit Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION sponsored a meeting for May 23rd. President Alexander G. Ruthven of the University, welcomed the visitors and members. Dean Charles B. Jordan discussed Food, Drug and Cosmetic Legislation, Edgar H. Gault spoke on "The Ethics of Modern Advertising," Dr. Louis H. Newburgh's subject was "Drugs and Nutrition," and Dr. H. H. Willard presented "Ultra Violet Fluorescence as Applied to Problems of Chemistry and Pharmacy." A dinner was part of the program and the Branch elected officers for the ensuing year.

GOLDEN JUBILEE MEETING OF THE NATIONAL EDITORIAL ASSOCIATION

Celebrating the 50th birthday of the National Editorial Association, prominent personages of

the Fourth Estate gathered at New Orleans May 4th-12th, from all parts of the nation to participate in an outstanding program for its 50th Anniversary meeting.

RETAIL DRUG TRADE BUDGETS

The National Code Authority for the Retail Drug Trade has made application for extension of its Budget and Basis of Contribution and of the Budgets and Bases of Contribution for certain of its Local Committees which were approved for the period from November 1, 1934, to April 30, 1935, such extension to cover the period from April 30, 1935, to June 16, 1935. The National Industrial Recovery Board has May 13th signed an Order, No. 60-430 approving such extension, such approval being effective fifteen (15) days from the date hereof unless prior to that time good cause to the contrary is shown and a subsequent order is issued.

In a letter directed to all Code Authorities released May 15th, the National Industrial Recovery Board sharply differentiated between code administration and trade association activities, advising code authorities that expenses for trade association functions would not be approved unless such activities are specifically authorized in the code.

THE NRA DECISIONS

The general views expressed in the press that the NRA would be granted extension were typed for these columns but had to be deleted as the decisions of the United States Supreme Court of May 27th, necessitate action by Congress. The general opinion in Administration circles now is that the NRA can be redrafted to conform with the decisions, under the conditions that have developed there is no certainty as to what the effect of the decisions will mean in connection with pending legislation.

The decisions should stimulate study and cooperative action by code authorities, the divisions of the industry and the organizations which are in accord relative to the possibilities of establishing fair trade practices as contemplated by the codes.

The Texas Legislature amended the Texas Pharmacy Law lowering the annual renewal certificate fee from \$3.00 to \$2.00 and the members of the Board of Pharmacy are allowed \$10.00 per day during active work at examination sessions.

BOOK NOTICES AND REVIEWS

A Text Book of Pharmacognosy By GEORGE EDWARD TREASE, B Pharm, PhC, Lecturer on Pharmacognosy in the University College of Nottingham, with contributions by H H Barker W R Heading, H M Hirst and A H Ware vi + 653 pp, 187 figs Baltimore, Wm Wood and Co 1935 Price \$6 00

This new text in pharmacognosy is stated by its English author to cover the requirements in pharmacognosy of students reading for pharmaceutical examinations in most English speaking countries

Its contents are arranged in three parts, an appendix and index Part I, entitled "General Principles" comprising 132 pages, contains a brief chapter on historical pharmacognosy which is followed by a chapter dealing with the cultivation of medicinal plants by H M Hirst and by three chapters dealing, respectively, with enzymes, vitamins and hormones by H H Barker There next follow chapters by the author on the collection, drying and storage of drugs, insects and other pests in drugs London commerce in crude drugs, one on plant principles and their extraction by W R Heading, another on tests for plant phenols as an aid to drug identification by A H Ware and two by the author on the microscope as an aid to drug identification and filtered ultra-violet light as an aid to drug identification

Part II, entitled "Drugs of Vegetable Origin," comprising 462 pages contains a chapter called "Introduction" which briefly summarizes some facts concerning plant classification and nomenclature, and eight chapters dealing with the drugs of the Thallophytes, Pteridophytes, Gymnosperms and Angiosperms which the author has arranged into phyla and subphyla

Part III contains an introductory chapter of a page dealing with classification of animal drugs and a chapter on animals and animal products The appendix contains nearly six pages devoted to a glossary of Latin words used in naming species

In adopting the taxonomic method of presenting the subject matter on animal and vegetable drugs the author has followed what the experience of many of his fellow teachers have found to be more satisfactory than the morphologic method A condensed morphological classification in addition however, would seem desirable especially for correlating

the drugs representing similar organs or cell contents

The chapter on the cultivation of medicinal plants is well written and gives sufficient information on this topic for the time allotted for their presentation of this phase of pharmaceutical botany in the average undergraduate curriculum For purposes of the growers of medicinal plants, however, the information given under many of the species is too scant to be regarded of more than elementary value

The chapter on hormones is on the whole well written and an innovation in the average pharmacognosy text It is somewhat surprising that we note no mention under the Anterior Pituitary of the hormones Prolan A and Prolan B and no mention of the hormone Progesterin of the Corpus Luteum

Another innovation in a text of this kind is the chapter on "Filtered Ultra Violet Light as an Aid to Drug Identification" Fluorescence analysis as applied to crude drug identification has made rapid progress within the past decade and its evidence is often of some value in pharmacognosy when taken in conjunction with evidence derived from other sources The fundamentals of this comparatively new field including an adequate description of the Hanovia analytic quartz lamp and brief notes on the examination of types of pharmaceutical products are included in this chapter

In the consideration of most of the crude drugs the following order of treatment is noted British pharmacopoeial title or general Latin title, synonyms source and collection history, characters, constituents substitutes and uses Under characters the physical characteristics are given with usually the outstanding diagnostic histological features

It is surprising that one finds no mention of powdered drugs in various drug monographs especially since this phase of pharmacognosy is usually more needed in general pharmaceutical work than that of identifying the whole drug In many instances, also, the treatment of the microscopical characteristics of the whole drug is inadequate, and insufficient data are given on adulterants Most of the figures are good and have been borrowed from a variety of sources

The work as a whole is creditable and should serve as a text on pharmacognosy in colleges where British standards are taught providing

the data on histological details and adulterants and substitutes are amplified in the lectures. It may well serve as a reference for students of pharmacognosy generally.—H W YOUNG-KEN

Annual Survey of American Chemistry Volume IX, 1934, edited by CLARENCE J WEST, Director, Research Information Service National Research Council published for the National Research Council, by Reinhold Publishing Corporation New York, 400 pages Price \$4.50

The Annual Survey of American Chemistry for 1934 follows the same general principles as preceding volumes with the exception that this year the chapter on Biochemistry has been omitted. The reason assigned for the omission is that the Annual Survey of Biochemistry is fully covered by the Annual Survey of Biochemistry published by the Stanford University Press. Most of the contributors have been represented in previous volumes all of them outstanding in their special fields. The volume has 400 pages and is presented in twenty-five chapters half of them are concerned with industrial subjects and suggest the trends in the industry as well as the accomplishments of the period.

Each chapter is followed by references, citing the subjects discussed. The Authors' Index, in three columns, covers twenty pages and gives an idea of the completeness with which the subjects are dealt.

Previous volumes have been reviewed in this publication and the favorable comments made in these editions apply to this volume.

The Law of Patents for Chemists By JOSEPH ROSSMAN Patent Examiner, U S Patent Office member of the bar of the U S Court of Customs and Patent Appeals and the U S Supreme Court editor of the *Journal of the Patent Office Society* published by the Williams and Wilkins Co., Baltimore, Md. Price \$4.50

The publishers state that this is a work both for study to familiarize the reader with the essentials of Patent Law and for regular reference and to guide the inventor in practical matters pertaining to his protection. These matters are discussed in Part I. Part II discusses the essentials of Patent Law principles. Part III speaks of obtaining the patent. Part IV of the patentee's rights under the law.

The table of cases and the Index indicates the large number of important cases which have relation directly or indirectly to the drug industries.

The Glossary of ten pages defines words and phrases most commonly used in patent law. The author states that no attempt has been made to give exact legal definitions or explanations but rather to translate such terms into concise English so that they may be understood and used by the reader.

A Table of Contents shows that the book is divided into twenty-one chapters and has been divided for study and presentation.

The makeup of the book shows the usual care given by the publishers.

The Law of Drugs and Druggists A treatise with text, cases, statutes, readings and digests for schools of pharmacy, retail, wholesale and manufacturing druggists, by WILLIAM R ARTHUR Professor of Law at the University of Colorado published by West Publishing Co., St. Paul. Price \$3.00

The volume is dedicated to his friend, Col. Homer C. Washburn, dean of the School of Pharmacy, University of Colorado. It is stated in the Preface that the volume was commenced many years ago by Dean Washburn and the author of the volume but not completed until recently. Professor Arthur has been giving a short course on Drug Law to the Senior classes of the School of Pharmacy of the University of Colorado largely reviews of cases and the text is largely the result of these studies in analyzing litigations and cases in courts to bring out important details of laws relating to Pharmacy and allied branches. The book is divided into three parts: the first is a presentation of state and local laws, the second part of Federal statutes and regulations, and the third, in the form of an appendix, includes further references to food and drug legislation, narcotic and poison laws. The table of cases cited and discussed, covers ten two-column pages. The list is followed by a Glossary explaining the terms and definitions in law procedure. Sixty pages are given to the Index.

The book is well printed and bound and will be found of value when information relative to laws of the drug trade and industries is needed.

SEPARATE FORMS OF THE ABSTRACT SECTION

Extra forms of the Abstract Section can be supplied at 25 cents per set. This new service was begun in the March JOURNAL and will be continued each month. Order from the AMERICAN PHARMACEUTICAL ASSOCIATION, 2215 Constitution Ave. Washington D. C.

FAIR TRADE MEASURES

Governor La Follette, of Wisconsin has signed the Alfonso fair trade bill the Iowa Legislature has adopted the Berg fair trade bill and transmitted it to Gov. Clyde L. Herring. Both

the Wisconsin and the Iowa measures are based on the California Junior Capper Kelly law. Pennsylvania, Maryland, New Jersey, New York and other states have taken similar action or contemplate perfecting such legislation.

NOTICE TO CONTRIBUTORS TO THE JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION

The following notice has been prepared from comments received from members of the Board of Review of Papers and of the Publication Committee.

Manuscripts should be sent to Editor E. G. Eberle, 2215 Constitution Ave., N. W., Washington, D. C.

All manuscripts should be typewritten in double spacing on one side of paper $8\frac{1}{2} \times 11$ inches, and should be mailed in a flat package—not rolled. The original (not carbon) copy should be sent. The original drawings, not photographs of drawings, should accompany the manuscript. Authors should indicate on the manuscript the approximate position of text figures. All drawings should be marked with the author's name and address.

A condensed title running page headline, not to exceed thirty-five letters, should be given on a separate sheet and placed at the beginning of each article.

The method of stating the laboratory in which the work is done should be uniform and placed as a footnote at end of first page, giving Department, School or College. The date when received for publication should be given.

Numerals are used for figures for all definite weights, measurements, percentages and degrees of temperature (for example, 2 Kg., 1 inch, 20.5 cc., 300°C). Spell out all indefinite and approximate periods of time and other numerals which are used in a general manner (for example, one hundred years ago, about two and one-half hours, seven times).

Standard abbreviations should be used whenever weights and measures are given in the metric system, e. g. 10 Kg., 2.25 cc., etc. The forms to be used are cc., Kg., mg., mm., L. and M.

Figures should be numbered from 1 up, beginning with the text figures (line engravings are always treated as text figures and should be designed as such) and continuing through the plates. The reduction desired should be clearly indicated on the margin of the drawing. All drawings should be made with India ink, preferably on white tracing paper or cloth. If coordinate paper is used, a blue-lined paper must be chosen. Usually it is desirable to ink in the large squares so that the curves can be more easily read. Lettering should be plain and large enough to reproduce well when the drawing is reduced to the width of a printed page (usually about 4 inches). Photographs intended for half-tone reproduction should be securely mounted with colorless paste.

"Figure" should be spelled out at the beginning of a sentence, elsewhere it is abbreviated to "Fig.," per cent—2 words.

The expense for a limited number of figures and plates will be borne by the JOURNAL, expense for cuts in excess of this number must be defrayed by the author.

References to the literature cited should be grouped at the end of the manuscript under the *References*. The citations should be numbered consecutively in the order of their appearance (their location in the text should be indicated by full-sized figures included in parentheses). The sequence followed in the citations should be: Author's name (with initials), name of publication, volume number, page number and the date in parentheses. Abbreviations for journals should conform to the style of *Chemical Abstracts*, published by the American Chemical Society.

(1) Author, A. Y., *Am. J. Physiol.*, 79, 289 (1927).

Papers presented at the Sections of the AMERICAN PHARMACEUTICAL ASSOCIATION's annual meeting become the property of the Association and may at the discretion of the Editor be published in the JOURNAL. Papers presented at these Sections may be published in other periodicals only after the release of the papers by the Board of Review of Papers of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The Editor will appreciate comments from Board of Review and Committee on Publication, members, authors and others interested.

NEARER AND NEARER TO CONVENTION TIME

PLAN YOUR TRIP TO PORTLAND

The time for the annual meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION, August 5th-10th, is fast approaching and a most elaborate program has been arranged. Partial programs are published in this issue of the JOURNAL.

F C Felter, of the Publicity Committee, says that the AMERICAN PHARMACEUTICAL ASSOCIATION, with "A Pharmaceutical Air," will descend upon Portland, Ore., August 5th to 10th, when pharmacists from all corners of the United States take over the City of Roses and literally transform it into a "City of Mortars and Pestles."

As a convention city, Portland has a charm and beauty of surroundings perhaps unexcelled by any large community in America.

Hotel Multnomah Will Be the A PH A Headquarters

In order to stimulate a representative attendance the several Associations have approved a "Pharmaceutical Tour." Thus you may combine duty and business with a vacation of care-free ease—a vacation of scenic grandeur, varied interests, education and adventure.

The "Pharmaceutical Tour" has been carefully planned for your convenience, comfort and pleasure at extremely low all-expense rates. You will tour through Glacier National Park, the Canadian Rockies at Banff and Lake Louise, and view the virile beauty of the Pacific Northwest. We invite your exacting comparison with other trips offered, for here is a full measure of travel gems with the maximum of luxurious comfort, scenic attractions and pleasure at a minimum cost.

THE CHAIRMAN OF THE PLANT SCIENCE SEMINAR

Frank H Eby, chairman of the Plant Science Seminar, 1934-1935, was born in Lancaster County, Pa, in 1896, a few miles from where his early Pennsylvania Dutch ancestors settled in 1715 Here he received his early education and also served his first years of apprenticeship in pharmacy Later, he was employed in the stores of George B Evans and William J Pechin of Philadelphia In 1919, he received his diploma from the School of Pharmacy of Temple University and, in 1921, he was awarded the degree of Doctor in Pharmacy from the same institution

Professor Eby has been a member of the faculty of Temple University since 1920 and at present is professor of Botany and Pharmacognosy in the School of Pharmacy

He served as secretary of the Philadelphia Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION in 1929-1930 and as president of the Branch in 1933-1934 He is a member of the Pennsylvania Pharmaceutical Association and has held membership on a number of committees of this organization, at present he is chairman of the Committee on Biology and Pharmacognosy He is a member of the Committee on Materia Medica, Boards of Pharmacy and Colleges of Pharmacy, District No 2

During the World War Mr Eby served as a pharmacist in the Navy He is past-commander of the local Legion post, a member of the Blue Key Fraternity, Kappa Psi Pharmaceutical Fraternity and has always taken an active part in Boy Scout affairs

Professor Eby married Dorothy M Keller of Harrisburg in 1921, they have one son

Officers of the Plant Science Seminar *Chairman* Frank H Eby, *Vice-Chairman* L K Darbaker, *Secretary* *Treasurer* F J Bacon, *Executive Committee*, C E F Mollett, E B Fischer

EDITORIAL

E G EBERLE, EDITOR

2215 Constitution Ave., WASHINGTON, D C

THE INTERNATIONAL CONGRESS OF PHARMACY

PRESIDENT GENERAL R PATTOU of the International Congress of Pharmacy has advised that he will occupy himself with the questions of a professional nature concerning the free choice of pharmacists for organized pharmaceutical services. He desires to be advised as to how in the United States are pharmacists designated for furnishing medical supplies to organized services?

By "organized services" he understands those which are organized with the intervention

- (a) Of the *Public Authorities* The Federal Government, States, Municipalities
- (b) Of *Social Insurance Institutions*
- (c) Of *Mutual Aid Societies*
- (d) Of *Companies Insuring against Industrial Accidents*
- (e) Of any other organizations

He also desires to know whether all established pharmacists are authorized as a matter of right to have a part in furnishing supplies, in case certain conditions must be met in order to engage in furnishing supplies, what they are and what the opinion is of the pharmaceutical profession in the United States on the subject of free choice of pharmacists

Comment has been made on the International Congress of Pharmacy in prior issues of the JOURNAL. The general secretary is J Breugelmans, pharmacist of Brussels

THE EIGHTH INTERNATIONAL CONGRESS OF MILITARY MEDICINE AND PHARMACY

THE Eighth International Congress of Military Medicine and Pharmacy will be held at Brussels, Belgium, from June 27 to July 3, 1935. The change of place from Bucharest to Brussels was made on account of the death of Prof Butoianu, Surgeon General of the Roumanian Army

The Seventh Congress, held at Madrid in 1933, proposed the following topics which will be considered at the forthcoming Congress

- 1 "Principles of Organization and Function of the Medical Service in Mountain Warfare" Reporters Roumania and Italy
- 2 "Determination of Aptitude for the Various Specialties in the Medical Services of the Army, Navy and Air Force" Reporters Roumania and France
- 3 "Sequelæ of Wounds of the Abdomen" Reporters Roumania and the United States
- 4 "Researches Concerning Standardization of Methods of Analysis of Foods and Drinks for the Use of the Soldier" Reporters Roumania and Czechoslovakia
- 5 "Buccal-Dental Prophylaxis at the Front" Reporters Roumania and Lithuania

6 "Comparative Study of the Medical Administrative Services of Various Armies, Navies and Air Services" Reporters Roumania and Chile

The Brussels Congress will doubtless be as important and interesting as those which have gone before it. As Roumania was to have entertained the Congress, each discussion, in keeping with the usual custom, is opened by representatives of Roumania. Information regarding the meeting may be had from the Secretary of the Association of Military Surgeons of the United States, Army Medical Library, 7th and B Sts., Washington, D. C.

These data were obtained through courtesy of *The Military Surgeon* of June 1935

PHARMACISTS AND PUBLIC HEALTH SERVICE

PHARMACISTS have an important part in public health service and first aid, represented not only in bringing medical attention to the injured and suffering, but in supplying materia medica which will afford relief and prevent spread of disease. An unusual case, in Washington, within the past month, presents several phases. Two young men, a freshman at George Washington University and a Government employee, were on a hike on the Chesapeake and Ohio Canal tow-path—when the former was bitten by a copperhead. Fortunately, the snake was seen and the danger recognized, but strange to say, neither of the young men had a pocket-knife. Safety prompted the use of nature's provision (the teeth) in opening the wound and bringing about flow of blood, and further comradeship was shown in the act of carrying the crippled man a distance of two miles. The purpose of this comment follows.

Interns treated the wound with an antiseptic and, later, the young man was discharged and returned home, soon the leg began to swell. The boy's father, a chemist, called the family doctor, who advised that because snake-bites are rare, he was not informed relative to efficient treatment. Dr. William F. Mann, director of the Zoo, advised the injection of a serum which was supplied by a well-known professional pharmacy, the injection was given and the young man's life saved. The unusual occurrence brought difficulties and, throughout, the finest cooperation, this is a purpose of the comment and presents several thoughts from which lessons may be drawn.

Bites and stings are vacation handicaps and so are the effects of contact with poisonous plants, and it is the pharmacist's duty to supply the means of relief and the antidotes, and therefore, inform himself relative to the best means of service. The Ohio State Division of Conservation broadcasts information on ivy poisoning and as a preventive suggests the use of the wash devised by Dr. J. B. McNair—a 5 per cent solution of ferric chloride in a 50-50 mixture of water and glycerin. The exposed parts of the skin are washed with the preparation and allowed to dry, the iron in the latter combines with the poison and prevents its ill-effects.

It is advisable to destroy the poison of the plant or insect, for bites, the general rule may be laid down to neutralize the poison, usually of an acid nature, soothe, don't scratch. Breeding places for mosquitoes and other insects are a menace, their activities are dangers to public health.

This comment is for pointing to the pharmacists' place in health service.

DRUG EXTRACTION II THE EFFECT OF FINENESS OF POWDER AND OF VARIATION IN SOLVENTS ON THE PERCOLATION OF BELLADONNA ROOT^{1 2}

BY WILLIAM J HUSA³ AND C L HUYCK⁴

In connection with the general study of the fundamental principles of drug extraction which is being carried out in the Department of Pharmacy of the University of Florida it seemed desirable to investigate the extraction of a series of drugs of different types Belladonna root was selected as representing a simple type of plant structure containing alkaloids as the active constituents The work reported in this paper covers research on the swelling of belladonna root in various solvents and the effect of fineness of powder and variation in solvents on the percolation of belladonna root

EXPERIMENTAL PART

Materials Used — Except where otherwise specified, the belladonna root used was from the 125 lb shipment previously described (1) A thorough pharmacognostic study was made and it was found that the shipment conformed to the U S P description

Swelling of Strips — Using the technique (1) of making measurements with a filar micrometer of the width of thin strips of cross sections before and after the addition of solvents, the swelling of the wood of belladonna root in various liquids was determined Cross sections 0.10 to 0.15 mm thick were cut by means of a sharp carpenter's plane The results, which in each case are the average of several determinations, have been expressed on a percentage basis, taking the width of the dry strips as 100

TABLE I — THE EFFECT OF ALCOHOL-WATER MIXTURES ON THE WOOD OF BELLADONNA ROOT

Vol of Alcohol	Vol of Water	Average Width of Strips of Cross Sections (Dry = 100) after Time Intervals in Minutes							
		0	1	3	10	20	40	60	90
0	1	100	110	109	110	110	110	113	112
1	3	100	110	109	109	110	110	112	110
1	2	100	106	105	109	111	111	111	112
1	1	100	105	105	105	106	106	106	
3	2	100	102	101	102	102	103	104	103
7	3	100	102	101	102	102	104		
4	1	100	101	101	101	101	103	103	
5	1	100	101	101	102	102	102	101	101
9	1	100	101	102	102	102	102	102	
1	0	100	101	100	100	100	100		

Table I shows that a mixture of 1 vol of alcohol and 3 vol of water gave the same swelling curve as water alone As the percentage of alcohol increased there was an increasing tendency to

¹ Scientific Section, A Ph A Washington meeting 1934

² This paper is based on a thesis presented to the Graduate Council of the University of Florida by C L Huyck, in partial fulfillment of the requirements for the degree of Master of Science in Pharmacy

³ Head Professor of Pharmacy, University of Florida

⁴ Graduate Scholar University of Florida, 1932-1933

ward a smaller primary swelling and a smaller total swelling during the period of the test. Alcohol has practically no effect of swelling or shrinking on the wood of belladonna root. Tests made with drug from another shipment gave similar results with the exception that the initial swelling in water was about 30% instead of 10%. It seems likely that the percentage swelling may vary according to the age of the root and the extent to which it has been dried. According to Gortner (2) bio colloids show a decrease in imbibition capacity with age, old plant tissues being in general less highly hydrated than are the younger tissues.

TABLE II—THE EFFECT OF GLYCERIN-WATER MIXTURES ON THE WOOD OF BELLADONNA ROOT

Vol of Glycerin	Vol of Water	Average Width of Strips of Cross Sections (Dry = 100) after Time Intervals in Minutes							
		0	1	5	10	30	60	90	120
1	0	100	100	100	101	103	104	105	106
4	1	100	103	103	105	108	108	108	108
3	2	100	105	106	106	107	107	107	107
1	1	100	108	108	108	108	108	109	109
1	3	100	108	110	110	110	110	111	112
1	7	100	108	109	109	110	110	110	110

The above results indicate that glycerin causes a gradual swelling of the wood of belladonna root, amounting to 6% in two hours. With increasing proportions of water, the primary rise in creases and there is a more rapid approach to equilibrium.

TABLE III—THE EFFECT OF GLYCERIN-ALCOHOL MIXTURES ON THE WOOD OF BELLADONNA ROOT

Vol of Glycerin	Vol of Alcohol	Average Width of Strips of Cross Sections (Dry = 100) after Time Intervals in Minutes						
		0	1	3	30	60		120
9	1	100	101	101	102	103		106
4	1	100	100	100	101	103		105
3	2	100	99	99	101	103		105
1	1	100	97	97	98	99		100
1	3	100	99	98	99	99		102
1	7	100	99	99	99	100		100

As to the effect of alcohol-glycerin mixtures on the swelling of belladonna root it may be said that the swelling in a mixture of these liquids is practically an average of the effects of the liquids themselves when allowance is made for the relative proportions of the two liquids in the mixture.

The Effect of the Fineness of Powder on the Percolator of Belladonna Root—100 Gm portions of belladonna root in Nos. 20, 40, 60 and 80 powders were percolated by the U S P process for the fluidextract, 80 cc of reserve percolate being set aside in each case and the further percolate being collected in successive 100-cc portions.

Numerous tests were carried out to determine the amount of menstruum necessary to render powdered belladonna root "evenly and distinctly damp" as specified in the U S P. Naturally this would vary with different samples of drug according to moisture content. For the drug used in this experiment containing about 10% moisture, 90 cc of menstruum seemed right for moistening 100 Gm of drug. Accordingly this amount of menstruum (alcohol 5 vol—water 1 vol) was used for moistening each 100-Gm portion of drug, and the drug macerated for six hours. The drug was then packed in the percolators as uniformly as possible, and, following the U S P directions, macerated for 48 hours. The reserve portions of 80 cc were then collected at the rate of 10 drops per minute, and then four successive 100 cc portions were collected at the rate of 20 drops per minute. Wherever it was neces-

sary to stop the percolation for a few hours, such as over night, the time factor was held constant for each portion of drug

The various fractions of percolate were assayed for total alkaloids and total extractive

TABLE IV—EFFECT OF FINENESS OF POWDER ON PERCOLATION OF BELLADONNA ROOT Gm OF ALKALOID IN VARIOUS PORTIONS OF PERCOLATE

Percolate	No 20 Pwd	No 40 Pwd	No 60 Pwd	No 80 Pwd
80 cc	0 301	0 307	0 305	0 300
100 cc	0 109	0 149	0 160	0 160
100 cc	0 015	0 027	0 016	0 019
100 cc	0 001	0 009	0 003	0 004
100 cc	0 002	0 003	0 002	0 002
Total	0 428	0 495	0 486	0 485

Gm Total Extractive in Various Portions of Percolate

80 cc	6 91	6 73	8 27	7 46
100 cc	6 76	6 70	7 23	7 49
100 cc	3 52	3 88	4 47	4 73
100 cc	1 83	1 95	3 10	2 42
100 cc	0 86	1 05	1 90	0 91
Total	19 88	20 31	24 97	23 01

The results in Table IV indicate that within the limits of No 20 and No 80 powder, the fineness of powder is of minor importance as to its effect on rate of extraction of alkaloids by percolation. In each case the amount of alkaloid beyond the third percolate was comparatively unimportant. The data as to total extractive agree with the previous findings (1) that the yield of total extractive increases as the size of powder decreases down to and including No 60 powder and that with the No 80 powder there is a decrease in yield of total extractive.

No extensive work has previously been done on the relation of the fineness of powder to the extraction of belladonna root. At the present time the British Pharmacopœia uses a No 22 powder and the U S P specifies a No 40 powder.

The Effect of Variation of Solvents on the Percolation of Belladonna Root—100 Gm portions of belladonna root in No 40 powder were percolated by the U S P process for the fluidextract but using various alcohol-water mixtures in two series of percolations. In each case 80 cc of reserve percolate were set aside and the further percolate collected in successive 100-cc portions. The amount of moistening liquid used was 90 cc for each 100 Gm portion of drug.

TABLE VI—PERCOLATION OF BELLADONNA ROOT WITH VARIOUS ALCOHOL-WATER MIXTURES

(SECOND SERIES)

Gm Alkaloid in Various Fractions of Percolate

Percolate	Alc 5 Vol — Water 1 Vol	Alc 4 Vol — Water 1 Vol	Alc 7 Vol — Water 3 Vol	Alc 1 Vol — Water 1 Vol	Alc 1 Vol — Water 2 Vol
80 cc	0 295	0 241	0 303	0 304	0 233
100 cc	0 164	0 182	0 153	0 158	0 186
100 cc	0 006	0 001	0 021	0 040	0 019
100 cc	0 000	0 001	0 001	0 001	0 002
100 cc	0 000	0 000	0 000	0 000	0 001
Total	0 465	0 425	0 478	0 503	0 441

Gm Total Extractive in Various Fractions of Percolate

80 cc	6 59	7 06	9 51	14 20	16 09
100 cc	7 66	8 41	10 99	10 95	12 46
100 cc	3 45	3 47	2 71	2 48	0 81
100 cc	1 63	1 26	1 12	0 33	0 19
100 cc	1 05	0 66	0 61	0 11	0 14
Total	20 38	20 86	24 94	28 07	26 69

The results in the preceding tables indicate that as the alcoholic strength of the menstruum decreases, extraction of alkaloids becomes more rapid and the yield of extractive becomes greater. It is evident that the four highest alcoholic strengths used do not make good menstrua for belladonna root. The next four proportions, *i e*, alcohol 5 vol —water 1 vol, alcohol 4 vol —water 1 vol, alcohol 7 vol —water 3 vol, alcohol 1 vol —water 1 vol, have approximately the same efficiency, resulting in extraction of substantially all of the alkaloid. As far as our present results go the official menstruum for the U S P fluidextract appears to be well chosen. The results of the U S P menstruum (Alcohol 5 vol —Water 1 vol) carried out two different times in the two different series of percolations agree fairly well. This indicates that the two series of percolations are comparable and that no important differences have arisen from differences in conditions such as temperature, degree of packing and time consumed in percolation. The discrepancy in the total alkaloid shown in case of the higher percentages of alcohol has previously been investigated and explained (1).

DISCUSSION OF RESULTS

Water caused an immediate swelling of thin strips of the wood of belladonna root, the swelling curves being of the same type as those observed in case of thin strips of chestnut wood (1). The results of the tests of alcohol-water mixtures on

the wood of belladonna root are fully comparable with the results on chestnut wood on the more aqueous mixtures. With the more highly alcoholic liquids there is less swelling in the case of belladonna wood than in the case of chestnut wood. It would seem that woody tissues may differ more in behavior to alcohol than to water. The effects of mixtures of liquids on the swelling of the wood of belladonna root are in accord with previous conclusions that the effect of a mixture of two liquids is practically an average of the effects of the liquids themselves when allowance is made for the relative proportions. It is noteworthy that glycerin causes considerable swelling of the belladonna wood in two hours (60% as much as caused by water) whereas glycerin causes only a very slight swelling of chestnut wood (5% as much as caused by water). It should be noted that alcohol had exactly the reverse effect, causing no swelling in the case of belladonna wood but giving considerable swelling with chestnut wood (75% as much as caused by water). The opposite behavior of the two liquids with the two kinds of woody tissue is an example of a principle of colloidal chemistry, *i. e.*, that the swelling of gels is a process of highly selective character. Each gel shows an ability to take up a certain particular liquid (3). Further study of the swelling of drugs should lead to a better understanding of the fundamental principles involved and of their significance in the processes of drug extraction.

The results on percolation of belladonna root with alcohol-water mixtures are in general agreement with the work of Farr and Wright (4). A search of the literature shows that alcohol alone has not been favored as a *menstruum* for this drug, the trend having been toward the use of 50% to 85% alcohol.

SUMMARY

A study has been made of the swelling of the wood of belladonna root in binary mixtures of water, alcohol and glycerin. Percolation tests show that within the limits of No. 20 and No. 80 powder, the fineness of powder is of minor importance in the extraction of belladonna root. By a series of percolations of belladonna root, using various alcohol-water mixtures, it was found that mixtures ranging from alcohol 5 vol — water 1 vol to alcohol 1 vol — water 1 vol give the best results.

COMPARATIVE STUDIES ON THE UTILIZATION OF DIFFERENT MAGNESIUM SALTS *

BY J. C. FORBES AND F. P. PITTS

Although considerable work has been done on magnesium metabolism little data are available concerning the relative utilization of the naturally occurring

* Department of Chemistry, Medical College of Virginia, Richmond, Va.

magnesium compounds of foodstuffs as compared with the lactate and citrate and the inorganic magnesium compounds. Contrary to the usual conception certain magnesium salts are apparently well absorbed from the intestinal tract. Hirschfelder and Haury (1) found on an average in man 42.6 per cent of a purgative dose of Epsom salt excreted in the urine in 24 hours. Carswell and Winter (2) fed 8 Gm of magnesium lactate to adult men and found approximately 50 per cent absorbed. Barbour and Winter (3) conclude that dogs absorb magnesium lactate and gluconate far more readily than magnesium oxide.

The purpose of the present investigation was to determine if the magnesium compounds of natural foodstuffs differed in their absorption and utilization from the lactate and chloride, young white rats being used as experimental animals. Calcium and phosphorus balances were carried on at the same time as the magnesium studies and in several cases the effect of marked dietary alkalinity on the utilization of these elements was studied. The calcium, phosphorus and magnesium concentrations of the various diets were kept relatively constant, the calcium concentration being approximately 450 mg, phosphorus 500 mg and magnesium 240 mg per 100 Gm of ration.

Diets—All of the diets with the exception of that used in experiment Number 4 were prepared from the following stock diet:

Yellow corn meal	710 Gm
Meat meal	100 Gm
Dried milk	50 Gm
NaCl	5 Gm
KCl	2.5 Gm
Small amount of iron and trace of KI	

Dicalcium phosphate or calcium inositol hexaphosphate (a commercial preparation known as calciphos being used) was added to this stock diet to give an adequate calcium and phosphorus content. Magnesium lactate or chloride was added to supply the magnesium. Wesson oil to the extent of 10 per cent of the diet was added to increase the fat content. In some cases sodium carbonate to the extent of 2 per cent was also added. The diet used in experiment Number 4 was made up as follows, alfalfa and linseed meal supplying most of the magnesium content:

Yellow corn meal	1000 Gm
Meat meal	200 Gm
Alfalfa	200 Gm
Linseed meal	600 Gm
Calcium lactate to give an adequate calcium concentration	

During the experimental period the rats, two per cage, were kept in round metabolism cages beneath which was a wire gauze and glass funnel to collect feces and urine respectively. The separation of urine and feces was as a rule quite complete but a small amount of spattered food was usually present in the urine. The collection of urine and feces was made at weekly intervals. The supporting funnel was always washed down with dilute hydrochloric acid and water so as to dissolve any precipitated salts; the washings being added to the urine. Distilled water was given at will and five drops of cod liver oil fed daily per cage.

Methods of Analysis—Food and feces analyses were carried out by Morris Nelson and Palmer's method (4). Urines were always acidified, when necessary, diluted to a definite volume, and aliquots taken for calcium and phosphorus analysis. Urine magnesium determinations were carried out on the calcium supernatant fluid in exactly the same manner as used for food and feces.

Remarks—Experiment No. 1—Diet contained CaHPO_4 and Mg lactate. Ca:P:Mg ratio was 1:1.066:0.593.

TABLE I — UTILIZATION OF CA, P AND MG BY RATS

Expt No	Cage	Duration Weeks	Av Gain per Week Gm	Average Daily Intake			Average Daily Retention			Per Cent			% Mg Absorbed
				Ca	P	Mg	Ca	P	Mg	Ca	P	Mg	
1	1	6	17	43	46	25	26	22	7 0	60	48	28	39
	2	6	20	45	48	27	31	22	7 6	69	46	28	41
2	1	5	18	43	45	19	29	24	3 5	67	53	18	30
	2	5	13	36	38	16	25	20	3 7	69	53	23	34

4	1	6	15	55	57	27	21	28	6 2	38	49	23	31
	2	6	14	58	60	28	22	31	6 8	38	50	24	30
5	1	5	25	55	59	31	32	35	5 4	58	59	17	29
	2	5	19	45	48	26	29	18	4 7	64	37	16	30
	3	5	17	46	49	27	29	18	4 7	63	36	16	30

Experiment No 2 — Diet similar to Experiment No 1, except that Ca P Mg ratio was 1 1 055 0 445 Same as in cages 1 and 2, plus 2 per cent Na CO₃

Experiment No 3 — Diet contained CaHPO₄ and MgCl₂, Ca P Mg ratio was 1 1 066 0 595

Experiment No 4 — Alfalfa and linseed meal diet, Ca P Mg ratio was 1 1 036 0 490

Experiment No 5 — Calcium inosite hexaphosphate and Mg lactate diet, Ca P Mg ratio was 1 1 074 0 580 Experiment No 6 — Same as foregoing, plus 2 per cent Na₂CO₃

CONCLUSIONS

It will be seen from Table I, which records the average weekly determinations of calcium, phosphorus and magnesium retention, that,

1 The different magnesium compounds used do not differ materially in either absorption or utilization The variation in average daily retention is apparently not significant, since the greatest and least retentions were obtained with the same magnesium salt, Experiments 1 and 2

2 The magnesium absorption, as measured by the sum of the urinary and retained magnesium, averaged 32.5 per cent of the intake, and varied between the limits of 29 and 41 per cent

3 Carswell and Winter (2) have shown that after oral administration of magnesium lactate one may obtain either high calcium, low magnesium or low calcium, high magnesium retentions Therefore, it is probable that the apparent effect of the naturally occurring magnesium compounds in linseed meal and alfalfa to produce a low calcium, high magnesium retention is not due to any difference of behavior of these compounds from that of the others

4 Addition of sodium carbonate to the diet to the extent of 2 per cent had no unfavorable effect on the utilization of calcium, phosphorus or magnesium

It is a pleasure to acknowledge a research grant from the Valentine Meat Juice Co., Richmond, to cover a part of the expense of this investigation

THE ARSENAMIDES COMPOUNDS CONTAINING THE AS-N LINKAGE *¹

BY G O DOAK

The reaction between arsenous halides and amines has been investigated by several workers with rather conflicting results. Thus Leeds (1), Landau (2), Schiff (3), Leonard (4), and Schmidt (5) all obtained compounds of the type $3\text{RNH}_2 \cdot \text{AsX}_3$. The latter three assigned structural formulas to these compounds, regarding them as substituted ammonium halides, $\text{As} \equiv (\text{NH}_2\text{RX})_3$. On the other hand Anschutz and Weyer (6) obtained compounds of the type $\text{X}_2\text{As-NHR}$ and $\text{XAs} = (\text{NHR})_2$, by using aniline and arsenous chloride and bromide. They could not obtain the compounds obtained by Landau and Schiff and believed these workers had been dealing with impure mixtures. Similarly Michaelis and Luxembourg (7) obtained $\text{Cl}_2\text{AsN}(\text{C}_4\text{H}_9)_2$ from diisobutylamine and arsenous chloride. Substituted arsenous halides and amines have also been investigated and yield similar products. Michaelis obtained $\text{Cl}(\text{C}_6\text{H}_5)\text{As-NHC}_2\text{H}_5$ and $\text{Cl}(\text{C}_6\text{H}_5)\text{AsN}(\text{C}_4\text{H}_9)_2$ from phenyl dichlorarsine and butylamine and dibutylamine (8). With triethylamine Michaelis obtained a product to which he assigned the formula $\text{Cl}_2(\text{C}_6\text{H}_5)\text{As} = \text{N}(\text{C}_2\text{H}_5)_3$. With ammonia he obtained the imide $\text{C}_6\text{H}_5\text{As} = \text{NH}$. Hugot had previously obtained an amide $\text{As}(\text{NH}_2)_3$ from arsenous chloride and ammonia which gave the imide $\text{As}_2(\text{NH})_3$ on heating (9). Ipatiew, Rasuwajew and Stromski (10) obtained $(\text{C}_6\text{H}_5)_2\text{AsNH}_2$ from diphenyl chlorarsine and ammonia.

From the work described in the present paper the reaction appears to be more complex than the previous work showed, and the conflicting results are due to the failure of the previous workers to isolate all the products of the reaction. Thus in nearly all the reactions studied, two or more products have been obtained or indicated. The reaction between an arsenous halide and an amine takes place according to the following equations

- 1 $\text{AsX}_3 + \text{RNH}_2 \longrightarrow \text{XAs-NHR} \cdot \text{HX}$
- 2 $\text{XAs-NHR} \cdot \text{HX} + \text{RNH}_2 \longrightarrow \text{XAsNHR} + \text{RNH} \cdot \text{HX}$
- 3 $\text{AsX}_3 + 2\text{RNH}_2 \longrightarrow \text{XAs}(\text{NHR} \cdot \text{HX})_2$
- 4 $\text{XAs}(\text{NHR} \cdot \text{HX}) + 2\text{RNH}_2 \longrightarrow \text{XAs}(\text{NHR})_2 + 2\text{RNH} \cdot \text{HX}$
- 5 $\text{AsX}_3 + 3\text{RNH}_2 \longrightarrow \text{As}(\text{NHR} \cdot \text{HX})_3$

The course of the reaction is influenced by several different factors, namely the order of mixing, strength of the base and the arsenous halide used. Certain steric effects also seem to influence the course of the reaction. When a *n*-heptane solution of aniline was added to a *n*-heptane solution of arsenous chloride, an 84.75 per cent yield of $\text{As}(\text{NHC}_6\text{H}_5 \cdot \text{HCl})_3$ was obtained, identical with the product obtained by Schmidt. When the order of mixing was reversed, a 33.56 per cent yield was obtained, and $\text{Cl}_2\text{AsNHC}_6\text{H}_5$ was isolated in considerable amounts from the heptane filtrate. Monomethylaniline gave only a 14.32 per cent yield of $\text{As}[\text{N}(\text{CH}_3)\text{C}_6\text{H}_5 \cdot \text{HCl}]_3$ as compared to the 33.56 per cent yield with aniline, while under similar conditions dimethylaniline did not react with arsenous chloride.

¹ From the Laboratory, Edward Kremers University of Wisconsin, Madison, Wis.

In addition to these arsenic compounds there is always a large amount of the ammonium halide formed in the course of the reaction and it is difficult, sometimes impossible, to separate the arsenic compounds

Several types of compounds have definitely been isolated in the various reactions studied. Compounds of the type $\text{XAs}(\text{NHR} \text{HX})_2$ and $\text{As}(\text{NHR} \text{HX})_3$ are high melting solids, soluble in water, usually with decomposition, and insoluble in organic solvents. They resemble the corresponding ammonium halides in properties, and are best regarded as arsenic substituted ammonium halides. Thus the piperidine compound, $\text{As}(\text{NC}_6\text{H}_{10} \text{HCl})_3$, which is only slightly decomposed by cold water, precipitates silver chloride and lead chloride with silver nitrate and lead acetate solutions, forming $\text{As}(\text{NC}_6\text{H}_{10} \text{HCOOCH}_3)_3$ and $\text{As}(\text{NC}_6\text{H}_{10} \text{HNO}_3)_3$.

Compounds of the type X_2AsNHR are high-boiling liquids or low melting solids, obtained by distillation of the solvent after removal of the precipitated ammonium halide and the insoluble arsenic compounds. They fume in the air and are decomposed violently by water. Leonard (4) obtained only a 66 per cent yield of $\text{As}(\text{NC}_6\text{H}_{10} \text{HCl})_3$ using arsenous chloride and piperidine in *n* heptane solution. This low yield was explained by the solubility of this compound in heptane, which is incompatible with the hydrochloride formula he proposed for the compound. He found, however, that ether precipitated the compound from heptane solution. In repeating Leonard's work, the author determined the solubility of $\text{As}(\text{NC}_6\text{H}_{10} \text{HCl})_3$ in heptane and found it to be 4×10^{-6} Gm per cc at 25° . The low yield obtained by Leonard is due to the formation of other heptane-soluble compounds of the type X_2AsNHR . Unless the ether is anhydrous these compounds are decomposed by the water present into arsenous oxide and piperidine hydrochloride.

NOMENCLATURE OF THE ARSENIC COMPOUNDS

The name "arsenamide" is suggested for compounds containing the As N linkage. Thus the following compounds, prepared by the author, are named $\text{C}_2\text{H}_5(\text{I})\text{As}-\text{NHC}_6\text{H}_5$, aniline-ethylodoarsenamide, $\text{Cl}_2\text{AsN}(\text{C}_2\text{H}_5)_2$, diethylamine dichlorarsenamide, $\text{As}(\text{NC}_6\text{H}_{10} \text{HCl})_3$, piperidine-arsentriamide trihydrochloride, and $\text{ClAs}(\text{NH} \text{CH}_2 \text{CH}_2\text{NH}_2 \text{HCl})_2$, ethylenediamine-chlorarsendiamide dihydrochloride.

EXPERIMENTAL

The arsenous halides and amines were commercial products, purified by distillation. The substituted arsenous halides were prepared by the author. In the majority of the reactions studied anhydrous *n* heptane was used as the solvent. This was prepared from Diggers Pine oil by the method of Kremers (11). Where other solvents were used they were rendered completely anhydrous. The heptane solution of the amine or arsenous halide was placed in a tall form beaker and surrounded with an ice bath. The tall form beaker was found most convenient for removal of the precipitate formed in the course of the reaction. The beaker was equipped with a cork, mechanical stirrer and dropping funnel. In some cases nitrogen gas was passed into the vessel during the course of the reaction, but this was usually found to be unnecessary. The *n* heptane solution of the arsenous halide or amine was then added dropwise and the mixture stirred during the addition and for one hour longer to ensure the completion of the reaction. A heavy white precipitate formed immediately on addition of the solution. At the completion of the reaction the mixture was filtered, using suction. Nitrogen gas was used to protect the product from oxidation. The filter was further protected from moisture by placing P_2O_5 tubes in the

suction and nitrogen lines. The precipitate was washed several times with the pure solvent transferred to a vacuum desiccator, and the air removed by flushing several times with nitrogen gas, and finally dried for several days at 20 mm pressure. This precipitate consisted of the hydrohalide of the amine used, mixed with any insoluble arsenic compounds. Since these compounds are insoluble in organic solvents, and in most cases are decomposed by water or alcohol their separation from the amine hydrohalide is extremely difficult. In the case of the piperidine compound it can be purified by fractional crystallization from alcohol. In several other cases separation can be effected by vacuum sublimation as described by Schmidt for purifying the aniline compound. In most cases however, no means of separation was found. In these cases the arsenic content was determined by analysis and computed to percentage of arsenous halide converted into arsenamide hydrohalides.

The filtrate from the original reaction contains the compounds of the type X_2AsNHR . The solvent was removed by distilling in an atmosphere of nitrogen at reduced pressure, and the arsenic compounds fractionated at 1-2 mm pressure. These were collected in special receiving bottles filled with nitrogen gas, and analyzed in thin-walled glass bulbs which could be crushed beneath the liquid used for analysis. In spite of these precautions it was difficult to obtain accurate analyses of these extremely unstable liquids.

REACTIONS STUDIED

(1) Arsenous chloride and aniline. A n heptane solution of aniline added to a n heptane solution of arsenous chloride gave an 84.74 per cent yield of aniline arsenotriamide trihydrochloride $As(NH C_6H_5 HCl)_3$. It is a yellow solid, decomposed by water, insoluble in organic solvents.

Calculated for $As(NH C_6H_5 HCl)_3$, arsenic 16.28 per cent. Found arsenic 16.36 per cent. This compound is identical with that prepared by Schmidt (5). When the order of mixing was reversed the precipitate consisted largely of aniline hydrochloride. Arsenic analysis on the precipitate showed that there were present 33.56 per cent of the original arsenous halide used, but no means could be found of separating any arsenic compounds from the aniline hydrochloride. The filtrate after removal of the heptane yielded aniline dichlorarsenamide, $Cl As NHC_6H_5$, a yellow crystalline solid, m p 89° , decomposed violently by water.

Calculated for $Cl As NHC_6H_5$, arsenic 31.50, chlorine 29.83. Found arsenic 31.88, chlorine 29.92.

(2) Arsenous chloride and piperidine. A n heptane solution of arsenous chloride added to a n heptane solution of piperidine gave a 20.95 per cent yield of piperidine arsenotriamide trihydrochloride, $As(NC_4H_{10} HCl)_3$. The compound was purified by fractional crystallization from absolute alcohol. It crystallized in long needles, m p $240-242^\circ$ and was decomposed by hot water and boiling alcohol. Calculated for $As(NC_4H_{10} HCl)_3$, chlorine 24.39. Found chlorine, 23.44. This compound is identical with that prepared by Leonard (4). The filtrate gave a yellow oil, b p $98^\circ/1$ mm. It fumed in the air and accurate analyses could not be made. It is probably piperidine dichlorarsenamide $Cl As NC_4H_{10}$. The piperidine arsenotriamide trihydrochloride gave piperidine arsenotriamide trinitrate with silver nitrate in theoretical amounts, m p 144° .

Calculated for $As(NC_4H_{10} HNO_3)_3$, arsenic 14.52. Found 14.89. With lead acetate piperidine arsenotriamide triacetate $As(NC_4H_{10} CH_3COOH)_3$, was obtained m p 304° .

(3) Arsenous chloride and diethylamine. A n heptane solution of arsenous chloride added to a n heptane solution of diethylamine gave a precipitate consisting largely of diethylamine hydrochloride. Arsenic analysis on the precipitate showed that there was present 24.30 per cent of the original arsenous halide used. No arsenic compounds could be separated from the diethylamine hydrochloride. The filtrate gave diethylamine dichlorarsenamide $Cl_2 AsN(C_2H_5)_2$, a yellow liquid, b p $107^\circ/38$ mm, fuming in the air, decomposed violently by water.

Calculated for $Cl_2 AsN(C_2H_5)_2$, chlorine 32.58. Found 32.35, 32.16.

(4) Arsenous chloride and ethylenediamine. A n heptane solution of arsenous chloride added to a n heptane solution of ethylenediamine gave a white precipitate, ethylenediamine-chlorarsendiamide dihydrochloride $ClAs(NH CH_2 CH_2 NH HCl)_2$, was obtained by extracting with boiling anhydrous acetone. It was a white solid charring above 225° without melting.

Calculated for $\text{ClAs}(\text{NHCH}_2\text{CHNH}_2\text{HCl})$, arsenic 24.86, chlorine 34.99 Found arsenic 24.20, chlorine 34.09 The heptane filtrate was not examined

(5) Arsenous chloride and methylaniline A *n* heptane solution of arsenous chloride added to a *n* heptane solution of methylaniline gave a precipitate consisting largely of methyl aniline hydrochloride Arsenic analysis on the precipitate showed that there was present 14.32 per cent of the original arsenous chloride used No arsenic compounds could be separated from the methylaniline hydrochloride The filtrate gave methylaniline dichlorarsenamide $\text{Cl}_2\text{AsN}(\text{CH}_3)\text{C}_6\text{H}_5$, b p $116^\circ/3 \text{ mm}$, fuming in the air and decomposed by water

Calculated for $\text{Cl}_2\text{AsN}(\text{CH}_3)\text{C}_6\text{H}_5$, chlorine 28.18 Found chlorine 28.29

(6) Arsenous chloride and benzylamine A *n* heptane solution of arsenous chloride added to a *n* heptane solution of benzylamine gave a white precipitate from which benzylamine arsenetriamide trihydrochloride was separated by sublimation at $170\text{--}200^\circ$ and 2-mm pressure It was a white solid, m p 246° (decomposition) decomposed by water and alcohol

Calculated for $\text{As}(\text{NHCH}_2\text{CH}_2\text{HCl})_3$, arsenic 14.91, chlorine 21.19 nitrogen 8.36 Found arsenic 14.84, 14.87, chlorine 21.05, 21.44, nitrogen 8.38, 8.18 The benzylamine compounds were among the first studied and the heptane filtrates were not examined for possible arsenic compounds

(7) Arsenous chloride and dibenzylamine Dibenzylamine arsenetriamide trihydrochloride, $\text{As}[\text{N}(\text{CH}_2\text{C}_6\text{H}_5)_2\text{HCl}]_3$, was prepared in a similar manner from dibenzylamine and arsenous chloride and purified by vacuum sublimation It is a white solid, m p $252\text{--}254^\circ$ (decomposition) and decomposed by water and alcohol

Calculated for $\text{As}[\text{N}(\text{CH}_2\text{C}_6\text{H}_5)_2\text{HCl}]_3$, arsenic 9.69 chlorine 13.78 nitrogen 5.43 Found arsenic 8.23, chlorine 13.56 nitrogen 5.30

(8) Arsenous chloride and tribenzylamine Just as alkyl halides may be added to tertiary amines to form quaternary ammonium salts so arsenous chloride adds to tertiary amines to form arsenamide chlorides Tribenzylamine arsenetriamide trichloride, $\text{As}[\text{N}(\text{CH}_2\text{C}_6\text{H}_5)_3\text{Cl}]_3$, was prepared in a similar manner to the other two benzylamine compounds and was purified by sublimation at $130\text{--}140^\circ$ and 1 mm pressure It is a white solid, m p $209\text{--}211^\circ$ with decomposition

Calculated for $\text{As}[\text{N}(\text{CH}_2\text{C}_6\text{H}_5)_3\text{Cl}]_3$, arsenic 7.19, chlorine, 10.22 nitrogen 4.03 Found arsenic 7.47, chlorine 9.49 nitrogen 3.67

(9) Ethyldichlorarsine and piperidine A *n* heptane solution of ethyldichlorarsine added to a *n* heptane solution of piperidine gave a white precipitate consisting partially of piperidine hydrochloride By vacuum sublimation at $95\text{--}105^\circ$ and 1 mm pressure, piperidine ethyl arsenidamide dihydrochloride was separated from the piperidine hydrochloride It is a white solid, m p 196° , decomposed by water

Calculated for $\text{C}_2\text{H}_5\text{As}(\text{NC}_4\text{H}_9\text{HCl})$, arsenic 21.7, chlorine 21.0 Found arsenic 21.22 chlorine 20.5 The heptane filtrate gave piperidine ethyldichlorarsenamide $\text{C}_2\text{H}_5\text{As}(\text{Cl})\text{NC}_4\text{H}_9$ It is a yellow liquid, b p $108^\circ/8 \text{ mm}$ It reacts violently with water to give ethyl arsenoxide and piperidine hydrochloride

Calculated for $\text{C}_2\text{H}_5\text{As}(\text{Cl})\text{NC}_4\text{H}_9$, arsenic 33.52, chlorine 15.87 Found arsenic 33.30 chlorine 15.88

(10) Ethyldiiodoarsine and aniline A *n* heptane solution of ethyldiiodoarsine added to a *n* heptane solution of aniline gave a white precipitate consisting largely of aniline hydroiodide Arsenic analysis on the precipitate showed that there were present 12.92 per cent of the original ethyldiiodoarsine used No arsenic compounds could be separated from the aniline hydroiodide The filtrate gave aniline ethyldioarsenamide $\text{C}_2\text{H}_5(\text{I})\text{AsNHC}_6\text{H}_5$ as a light yellow oil b p $110^\circ/10 \text{ mm}$ which crystallized to a yellow solid on standing It fumed in the air and reacted violently with water Calculated for $\text{C}_2\text{H}_5(\text{I})\text{AsNH C}_6\text{H}_5$, arsenic 23.93 iodine 39.30 Found arsenic 23.84, 23.69, iodine 39.62

(11) Dimethylchlorarsine and piperidine A *n* heptane solution of dimethylchlorarsine added to a *n* heptane solution of piperidine gave a white precipitate consisting almost entirely of piperidine hydrochloride The heptane filtrate gave piperidine dimethylarsenamide $(\text{CH}_3)_2\text{AsNC}_4\text{H}_9$ It is a colorless liquid, b p $75^\circ/8 \text{ mm}$ This compound is considerably more stable toward moisture than the corresponding halogen arsenamides

Calculated for $(\text{CH}_3)_2\text{AsNC}_4\text{H}_9$, arsenic 39.64 Found arsenic 39.44 39.50

THE PREPARATION AND PROPERTIES OF 3,3'-BIS(AZOMETA-PHENYLENEDIAMINE)-4,4'-DIHYDROXYARSENOBENZENE AND 3,3'-BIS(AZO-2,6-DIAMINOPYRIDINE) 4,4'-DIHYDROXYARSENOBENZENE *

BY A E JURIST AND W G CHRISTIANSEN ¹

It is well known that certain azo dyes penetrate tissue very readily, thereby being disseminated widely throughout the body. Further, some azo dyes, such as trypan blue and trypan red, are absorbed by trypanosomes and have a definite trypanocidal action. Consequently it was decided to prepare some azo dyes from arspenamine base by diazotizing the latter and coupling with diamines. A number of arsono and arsono azo compounds have been described by Andreyev (1), Karrer (2), Barrowcliff, Pyman and Remfry (3), Benda (4), Jacobs and Heidelberg (5), and Ehrlich and Bertheim (6). Also some patents have been issued covering such compounds. However, none of them are of the type which we prepared by diazotizing arspenamine and coupling with metaphenylenediamine and with 2,6-diaminopyridine.

The two substances prepared in this investigation were 3,3'-bis(azometa-phenylenediamine)-4,4'-dihydroxyarsenobenzene (I) and 3,3'-bis(azo-2,6-diaminopyridine)4,4'-dihydroxyarsenobenzene (II).

When aqueous sodium hydroxide solutions of these compounds were injected intravenously into albino rats, the anticipated tissue staining characteristics resulted. Thus, within a short time after injection the conjunctiva, ears and abdominal cavities of the animals were stained. However, both of these compounds

* Scientific Section, A Ph A Washington meeting 1934

¹ Research Department of the Chemical and Pharmaceutical Laboratories E R Squibb and Sons, Brooklyn, N Y

were very toxic when compared to other arsphenamines. The sodium salt of 3,3'-bis(azo-2,6-diaminopyridine)-4,4'-dihydroxyarsenobenzene was found to be bacteriostatic to both *B. Typhoid* and *B. Staphylococcus* in concentrations of 1-20,000. Further, although the free base was only slightly soluble in water, a saturated aqueous solution was bacteriostatic to both *B. Typhoid* and *B. Staphylococcus*. However, both compounds appear to be too toxic for therapeutic use.

EXPERIMENTAL

3,3'-Bis(Azometa-phenylenediamino) 4,4'-Dihydroxyarsenobenzene—A solution of 8.8 Gm of arsphenamine in 880 cc of water was cooled in ice and 3.5 cc of concentrated hydrochloric acid was added. This was then diazotized by adding 3.0 Gm of sodium nitrite dissolved in 10 cc of water. After stirring for 1/2 hour, 4.3 Gm of metaphenylenediamine dissolved in an excess of dilute hydrochloric acid was added. After stirring for one hour a slight excess of sodium bicarbonate was added. A finely divided red brown precipitate formed which was separated by centrifuging. It was resuspended in water, collected on a Buchner funnel and washed with water.

Assay As found, 28.11%, calculated for $C_{12}H_{10}O_2N_4As$ 24.83%

The dark brown solid was soluble in concentrated aqueous hydrochloric acid and aqueous sodium hydroxide, giving a deeply colored solution. It was also slightly soluble in water, ethyl alcohol, methyl alcohol, acetone and ether. 0.2 Gm dissolved completely in 20 cc of water and 1.5 cc of normal sodium hydroxide.

Intravenous injections were made in rats using a solution of 0.5 Gm of compound in 5 cc of normal sodium hydroxide and 45 cc of water. A dose of 100 mg/Kg was lethal and stained the conjunctiva, ears and abdominal cavity a pale yellow color. Also a blue-greenish color of the skin of the back and shoulders was noted immediately after injection which disappeared in 30 minutes. Owing to the toxicity of this compound it was not further tested.

3,3'-Bis(Azo 2,6-diaminopyridine)-4,4'-Dihydroxyarsenobenzene—A solution of 5 Gm of arsphenamine base in 250 cc of water and 9 cc of concentrated hydrochloric acid was cooled to 0° C by the addition of ice and diazotized by adding 3.0 Gm of sodium nitrite dissolved in 20 cc of water. Then 3.0 Gm of 2,6-diaminopyridine dissolved in 12 cc of hydrochloric acid and 60 cc of water was added. The mixture was stirred for 1/4 of an hour and then neutralized with sodium bicarbonate. The precipitate so obtained was collected on a Buchner funnel and washed with water. The brown solid was insoluble in water, slightly soluble in dilute hydrochloric acid and readily soluble in aqueous alkali.

Assay Found, As 24.79%, N 22.94%, calculated for $C_{12}H_{10}O_2N_4As$, As 24.74% N 23.10%

This compound was tested for toxicity by intravenous injection. The solution was prepared by dissolving 1.0 Gm in 4 cc of normal sodium hydroxide solution and sufficient water to make solutions of 0.5% to 3.0% concentration. The results of these tests are given in the following table.

These results show that this compound is extremely toxic when injected intravenously since no rats survived even at doses of 5 mg/Kg. This compares unfavorably with a tolerated dose of 200 mg/Kg for arsphenamine.

The oral toxicity was found to be between 24 and 52 mg/Kg of body weight.

This compound was also subjected to germicidal and bacteriostatic tests on *B. Typhoid* and *B. Staphylococcus*. The results of these tests are given in Table II.

TABLE I

Dosage Mg /Kg	Concentration of Solution Used Per Cent	Number of Rats Injected	Number of Rats Died	Survival Time
5	0.5	2	2	4 to 21 hours
10	0.5	2	2	½ to 3 hours
10	1.0	2	2	2 to 6 hours
20	1.0	3	3	2 to 6 hours
40	1.0	3	3	2 to 5 hours
50	2.0	1	1	14 minutes
100	2.0	1	1	6 minutes
200	3.0	1	1	2 minutes
277	3.0	1	1	30 seconds

Alkaline solution 1-100	Inactive	Alkaline solution 1- 1 000	Active
Alkaline solution 1-500	Inactive	Alkaline solution 1- 5,000	Active
Alkaline solution 1-1000	Inactive	Alkaline solution 1-10,000	Active
Saturated aqueous solution	Inactive	Alkaline solution 1-20 000	Active
		Alkaline solution 1-50 000	Inactive
		Saturated aqueous solution	Active

NOTE These results apply equally to *B. Typhoid* and *B. Staphylococcus*

SUMMARY

1 Two azo derivatives of arsphenamine were prepared by coupling diazotized arsphenamine with metaphenylenediamine and 2,6-diaminopyridine, respectively

2 These two substances were found to penetrate the tissue of test animals very rapidly, but were too toxic for therapeutic purposes

3 One of these compounds, 3,3'-bis(azo-2,6-diaminopyridine)-4,4'-dihydroxy-arsenobenzene was found to be bacteriostatic but not germicidal to *B. Typhoid* and *B. Staphylococcus*

The biological tests on compounds reported herein were made in the Biological Research Laboratories of E. R. Squibb and Sons and we gratefully acknowledge their assistance

Harvard University has created a new Doctor of Philosophy degree in the "History of Science and Learning." Dr. Conant in explanation of this degree stated that "the history of science, the history of ideas, the history of scholarship and the history of universities should now be occupying the attention of many instead of a few."

Winners of the degree will be required to have a knowledge of six major fields and to master the technique of historical and scientific investigation. Harvard's Graduate School of Arts and Sciences now offers more than a score of courses in various phases of the history of knowledge.

THE EFFECT OF ALTITUDE ON THE ACTION OF DRUGS I STRYCHNINE *

BY A. W. MOORE AND JUSTUS C. WARD ¹

Medical and veterinary practice has long known that differences in altitude have made necessary the modification of doses in the use of many potent drugs. The purpose of these investigations is to make quantitative studies of the variation in lethal doses as well as of the speed of action of the drugs involved when all variables, except altitude, are held as constant as possible. Strychnine, as the sulphate, is the drug studied in the present communication.

Two distinct experiments were conducted. In the first series tame rats were used, in the second series, Columbian ground squirrels. One hundred tame rats

Fig. 1—Reaction time of rats to strychnine, periods until symptoms, duration of convulsions, and death

Fig. 2—Interval between administration and tetany or death, zone indicates duration of convulsions

of uniform size, 8 to 10 weeks old, were purchased from a Denver, Colo., breeder who raises large and healthy stock. Half of these were forwarded to Hillsboro, Ore., and the others retained at Denver. Feed for both groups was purchased at Denver and divided so the ration was identical at both stations. The animals were held for 3 months to insure complete acclimatization.

Just a few days before the tests were to be conducted, the poison solution to be used was prepared at Denver and also divided. Half of it was carefully sealed and sent to Hillsboro, and the other half retained at Denver. The same technique of administering the poison orally was employed at both elevations.

On the day of the tests, the room temperature, barometric pressure, relative humidity, and character of the weather were all recorded. There was fortunately

* Scientific Section, A. P. H. A., Madison meeting, 1933

¹ Bureau of Biological Survey, Hillsboro, Ore., and Denver, Colo.

a gratifying check of conditions, so the difference in barometric pressure due to the variation in altitude was the principal factor to explain the observed changes in rate and degree of strychnine action

Table I gives the climatological comparisons at the two stations during the period of the tests

The poison used in this test was strychnine as sulphate in a concentration of $2\frac{1}{2}$ mg /cc in distilled water

Table II gives the detailed experimental results of the altitude experiments with tame rats Fig 1 shows the same data graphically

In Table III the correlations were made on the basis of the probable errors (PE) of the averages and are so listed It appears from Tables II and III that the LD₁₀₀ per cent (lethal dose for 100 per cent of the animals tested) was 12.50 mg /Kg at Hillsboro and 10.00 mg /Kg at Denver Also 10/10 animals at Hillsboro died in 25 minutes after 4.1 minutes of intermittent tetany while at Denver the figures were 15.0 and 4.0 minutes respectively

TABLE I

	Hillsboro Oregon	Denver Colorado
Altitude	200 feet	5280 feet

7.50	1/10	33.0	7.0	40.0	3/6	15.3	14.7	30.0

* Time to onset of spasm * Period of intermittent tetany ♢ Time to death

TABLE III — STATISTICAL CORRELATIONS

Dose Mg /Kg	T/T		T/D	
	Hillsboro	Denver	Hillsboro	Denver
12.50	4.1 ± 2.49	5.6 ± 2.30	25.2 ± 11.18	12.8 ± 2.58
11.00	4.0 ± 1.41	4.0 ± 3.10	24.7 ± 9.15	12.3 ± 5.25
10.00	4.1 ± 2.39	4.0 ± 1.69	31.3 ± 5.08	15.0 ± 5.08
9.00	3.4 ± 1.42	4.3 ± 1.89	28.6 ± 5.15	20.7 ± 1.50
7.50		14.7 ± 6.40		30.0 ± 8.45

In Table IV an attempt was made to evaluate the survivals in relation to the effectiveness of the dose The averages for each dose were divided by the unit percentage of the animals that died in the series represented by the average involved For example at Hillsboro 100 per cent of the animals given 12.50 mg /Kg died in 25.2 minutes, accordingly $25.2/1.00 = 25.2$ However, at 9.00 mg /Kg only 50 per cent of the animals died in 28.6 minutes, and $28.6/0.5 = 57.2$ This then becomes the new average, when the survivals have been evaluated in this way Fig 2 shows graphically how well this system of correlation actually causes the data obtained to approach the ideal curves In the case of the 'time to death' T/D lines at Hillsboro the curve approaches a straight line at 12.50 and again at 7.50 mg /Kg, indicating all animals would die at 12.50 or above and all animals would live below 7.50 Between those figures the curve approaches the ideal configuration At Denver, however the experiment is not sufficiently complete at the lower doses to draw such definite conclusions It does, however, show that above 10.00 mg /Kg a

straight line is approached, and that below 7.50 the tendency would be a sharp break upward indicating a high percentage of survivals.

To determine whether the averages included in the above tables were significant, the PE of the differences between them were computed. Table V gives these data for the doses 9.00–12.50 mg/Kg. These figures were obtained from the averages of the animals that actually died, and consequently do not show the range that would have been indicated had the evaluated survivals been included. The table shows no significance for any of the figures on the period of intermittent tetany (T/T), but it does show PE of 2.9–5.56 for the T/D figures. From tables of probabilities (1) these figures mean that the chances of recurrence range from 1 in 20 to 1 in 5000. These ranges are not highly significant, but do indicate a definite effect from altitude differences on strychnine susceptibility.

Similar studies on Columbian ground squirrels were undertaken with much less detail in the field by the senior author.

The original plan was to conduct dosage trials so as to have the plant development stage similar at all elevations. This was done at the first two points studied,

Fig. 3—Toxicity of strychnine orally to Columbian ground squirrels

but the third and fourth locations were reached when plant growth was approximately a week younger than that at the first two.

Elevations used were obtained from Geological Survey maps, and are accurate to 100 feet.

Table VI shows a gradual decline in the LD_{100} per cent as elevation increases. Fig. 3 gives the data graphically. The animals used were obtained from areas where no trapping and poisoning had previously been done.

Table VI reveals two points of major interest.

(1) The LD_{100} per cent varies inversely with the altitude. Plotting LD_{100} per cent against altitude an equation can be developed $y = 14,300 - 520x$ (where y is the LD and x the altitude). This equation suggests a decrease in LD_{100} of about 2.0 mg/Kg for each 1000 ft increase in elevation, when Columbian ground squirrels are poisoned with strychnine. The LD_{50} per cent doses show a similar relationship.

(2) The T/D varies directly with the altitude. This conclusion is reached, however, from correlations in which average times for entire series were taken, and exactly comparable doses are not available.

TABLE IV—AVERAGES WITH SURVIVAL EVALUATIONS INCLUDED

	15 0	25/25	17 8	44 4

CONCLUSIONS

(1) A change in elevation of 5000 feet caused a 20 per cent reduction in LD₁₀₀ per cent and a 40 per cent decrease in the T/D (time to death), following oral administration of strychnine as the sulphate to tame rats.

(2) Statistical analysis shows the effects observed are not highly significant, ranging from 1-20 to 1-5000

(3) Inclusion of survivals, by a percentage system of evaluation, causes the curves to approach the ideal

(4) Successive increases of elevation of 1000 feet produced a definite and fairly constant reduction in LD₁₀₀ per cent of stryehnine administered orally to Columbian ground squirrels

(5) Ground squirrels appeared to be more susceptible than rats to changes in elevation

ACKNOWLEDGMENT

Much credit is due A D Stephenson, a junior in grazing studies at the University of Montana for without his assistance which he gave whole heartedly in the form of many 16 hour days, it would have been impossible to complete the studies on the Columbian ground squirrels as outlined Our appreciation is also due Dr James C Munch for his courteous assistance in checking the data presented, with particular reference to the statistical interpretations

THE PRESERVATION OF HALIBUT LIVER OIL WITH HYDROQUINONE *¹

BY W S JONES AND W G CHRISTIANSEN

It has been shown (1), (2) that the absorption of oxygen by cod liver oil is greatly retarded by the presence of an antioxidant, thus preventing loss of Vitamin A and development of mal-flavors in especially prepared oils. H N Brocklesby and O F Denstedt (3) have recently shown that the rate of absorption of oxygen by pilchard oil can also be decreased greatly by the addition of an antioxidant such as hydroquinone or pyrogallol.

Halibut Liver Oil is not only a very potent and highly concentrated source of Vitamin A, but also an oil which requires special refining in order to free it from natural objectionable odor and taste, hence an oil in which such protection should be of utmost importance. Therefore a study was made to determine the degree of protection afforded by an antioxidant such as hydroquinone in preventing vitamin and other deterioration. The present work shows that when halibut liver oil is exposed to both air and oxygen, the absorption of oxygen² and the loss of Vitamin A³ is greatly retarded by the presence of hydroquinone.

EXPERIMENTAL

A Type of Oils Studied—Two samples (A and B) of refined halibut liver oil differing slightly in Vitamin A potency were used, into a portion of each of these oils was incorporated 0.03% hydroquinone.

B Preparation of Samples—Four 25 Gm portions of each of the four oils were weighed into 100 cc tared beakers. Two weighed portions of each group were allowed to stand exposed to the air in the laboratory (A paper covering was placed over samples to protect them against dust and yet not to exclude free access of air). The remaining two weighed portions of each group were placed in a ten inch vacuum desiccator. By means of inlet and outlet tubes in the cover of the desiccator the air in the desiccator was swept out with oxygen. The inlet and outlet tubes were then closed off by means of pinch clamps.

C Testing of Samples—One sample of each pair was tested weekly by the Vitamin A color test, the second of each pair was weighed weekly. In case of samples exposed to oxygen the space in the desiccator was reflooded with oxygen and sealed from the air after each weekly observation.

D Vitamin A Color Unit—As a relative index of the Vitamin A potency of the oils, our laboratories have adopted a color standard (developed by the Biological Laboratories of E. R. Squibb and Sons) prepared as follows:

Five-cc portions of 0.5 M $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ (made up in 1% HCl) are measured out. 0.1, 0.3, 0.4, 0.5 and 0.6 cc portions of 0.5 M CoCl_2 in 1% HCl are added respectively to different portions of copper sulphate solution. The mixtures are then diluted with 1% HCl to exactly 10 cc and exactly 2 cc of each solution is transferred to a 1-cm bore test tube and sealed. The cobaltous chloride imparts a red tint to the blue copper sulphate solution and the gradation in red obtained by the addition of increasing amounts of the cobalt solution makes it possible to match accurately the shades of blue produced by different oils. One cm of thickness of this solution approximates six Lovibond blue units.

E Technique of the Antimony Trichloride Vitamin A Color Test—One tenth gram of oil is weighed out and dissolved in chloroform to make a volume of 50 cc. A measured volume of the chloroform solution is diluted with more chloroform so that the addition of 1.8 cc of a saturated

* Section on Practical Pharmacy and Dispensing, Madison meeting 1933.

¹ Research Department of the Chemical and Pharmaceutical Laboratories, E. R. Squibb and Sons, Brooklyn, N. Y.

² Determined by increase in weight of the oil.

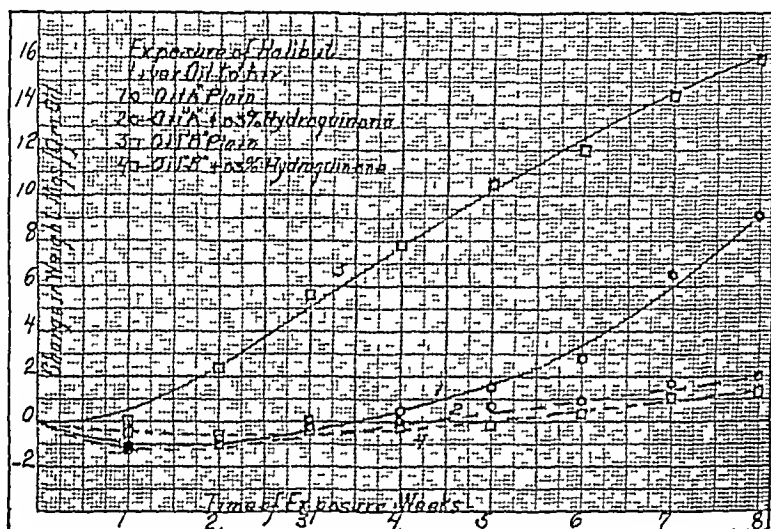

³ Determined by color test and confirmed by biological assay.

chloroform solution of antimony trichloride to 0.2 cc of the chloroform solution of oil in a 1-cm bore test tube produces a blue color which matches one of the copper sulphate standards. The Vitamin A color units per Gm of oil would then be

$$\frac{50 \times A}{\text{Wt of oil} \times 0.2}$$

A is the dilution factor, i. e. the degree to which the 50 cc of CHCl_3 solution must be diluted in order to match the standard blue. Thus if 5 cc is diluted to 20 cc, A will be 4.

F —The results of the successive color tests are recorded in Table I.

Graph 1

Vitamin A Color Units per Gm

Initial Color Test	Sample No	Condition of Exposure	Antioxidant	First Week	Second Week	Third Week	Fourth Week	Fifth Week	Sixth Week	Seventh Week	Eighth Week
Oil A 11,100 eu /Gm	1 Air	None		10600	10900	10530	9000	9090	6000	Released for Bio Assay	
	5 Air	Hydroquinone		10700	10800	10070	9250	10300	9500		
	3 Oxygen	None		10500	7500	*					
	7 Oxygen	Hydroquinone		10700	10400	9000	7500	5450	*		
Oil B 8700 eu /Gm	9 Air	None		7250	5200	3000	*				
	13 Air	Hydroquinone		7270	7700	7500	7850	7500	7300	6550	6410
	11 Oxygen	None		3230	*						
	15 Oxygen	Hydroquinone		8700	6820	6900	5680	5600	4500	2700	*

* At this point the color produced by the SbCl_3 has become so violet that it cannot be matched with the standards

It was noted during the course of the work that as the Vitamin A was being destroyed (as indicated by the color test) the color of the oil gradually changed from a light amber to a bright yellow. Further the color produced in the antimony trichloride test differed from the copper sulphate blue (it became reddish purple), so that it could not be matched by any of our standards. The difference was slight in the beginning and became more noticeable as the experiment progressed. This change was very rapid and pronounced in samples without antioxidant and exposed to oxygen, the change becomes slower when an antioxidant is used and the exposure is less severe, i. e., air instead of oxygen.

Graph 2

These color tests show that exposure of halibut liver oil to oxygen as such or as air causes Vitamin A deterioration and that these losses are retarded greatly by the addition of hydroquinone.

G—In order to confirm the results of the color tests, one pair of samples (Oil A without and with hydroquinone—Nos 1 and 5 in Table I) were assayed biologically after they had been exposed to air for six weeks. The results are contained in Table II and show the pronounced protection afforded by Hydroquinone.

TABLE II

	Vitamin A Potency in U S P Units *
Original Oil	76 750
After 6 weeks exposure to air without hydroquinone	41,500
Protected by addition of 0.03% hydroquinone and exposed to air for 6 weeks	61 250

* Not to be confused with new units (1934 Revised). To convert to 1934 Revised Units use factor 1.4

H—The change in weight of oils in mg/Gm of oil due to exposure to air and oxygen are recorded in Table III and the data are plotted in curves on Graphs 1 and 2. Due to the fact that the increases in weight of oils exposed to pure oxygen were so much greater than those of the oils exposed to air the data of the two groups were plotted on separate plates. No explanation can be given at present for the sudden, temporary leveling of Curve 3, Graph 2.

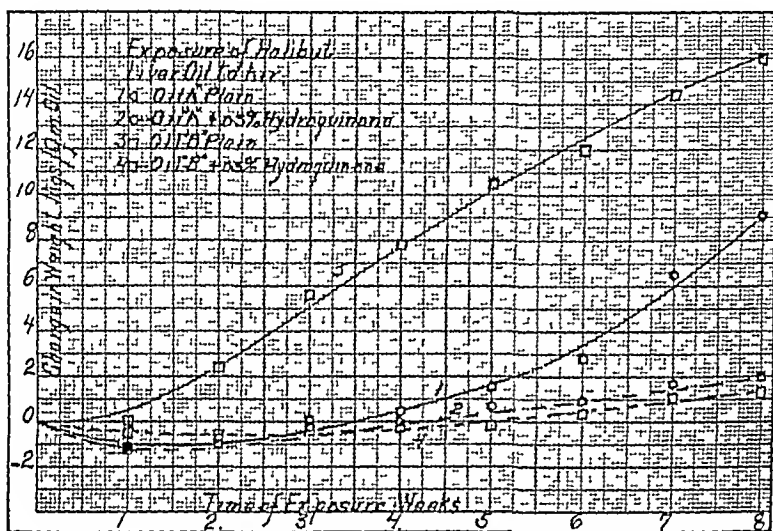

It will be noted from Graphs 1 and 2 that

chloroform solution of antimony trichloride to 0.2 cc of the chloroform solution of oil in a 1-cm bore test tube produces a blue color which matches one of the copper sulphate standards. The Vitamin A color units per Gm of oil would then be

$$\frac{50 \times A}{\text{Wt of oil} \times 0.2}$$

A is the dilution factor, i. e., the degree to which the 50 cc of CHCl_3 solution must be diluted in order to match the standard blue. Thus, if 5 cc is diluted to 20 cc, A will be 4.

F —The results of the successive color tests are recorded in Table I.

weight in mg/Gm of oil is recorded graphically in Graph 3

material and tend to become rancid. In order to study the antioxidant effect, if any, of maleic acid in halibut liver oil, an experiment, similar to that described above for oils "A" and "B" was set up, in which samples of a halibut liver oil, containing, respectively, (a) no antioxidant, (b) 0.03% hydroquinone, and (c) 0.03% maleic acid, were exposed to pure oxygen for 5 weeks. As before, one series of samples was weighed weekly and a second series was tested colorimetrically for Vitamin "A" weekly. The oil containing maleic acid was no more resistant to oxidation than the plain halibut liver oil and, according to the color test, lost its Vitamin "A" potency at the same rate as the plain oil. The oil containing the hydroquinone showed the usual resistance to oxidation and loss of Vitamin "A". The change in

CONCLUSIONS

- 1 Hydroquinone retards the absorption of oxygen by refined halibut liver oil from air and an atmosphere of pure oxygen
- 2 Hydroquinone, as indicated by the Vitamin A color test retards the deterioration of Vitamin A of halibut liver oil upon exposure to air or pure oxygen
- 3 Hydroquinone, as shown by the biological test retards the deterioration of Vitamin A of Halibut Liver Oil upon exposure to air
- 4 Maleic acid does not act as an antioxidant in halibut liver oil

Biological assays reported herein were made in the Biological Research Laboratories of E R Squibb and Sons and we gratefully acknowledge their assistance, also that of Mr E Beaman of Research Laboratories of E R Squibb and Sons who assisted in our experimental work

ACCURACY AND SPEED FACTORS IN HAND-FILLING CAPSULES *

BY JOHN W LEE ¹

The primary purpose of this paper is to compare two of the usual methods ordinarily employed in hand-filling capsules One of the first problems that confronts us in either the establishment of a tolerance limit or the comparison of methods in hand-filling capsules, is the method or manner in which the contents of an individual capsule is determined

Some of the methods that have been used in determining the contents of an empty capsule are

- (1) Dissolving the contents of the capsule in a suitable solvent and subsequent evaporation of the solvent ²
- (2) Assay of the ingredients by the Official Process
- (3) The emptying of the contents and weighing directly ³
- (4) Using individual capsules of the same size as a counterpoise ²
- (5) Weighing a number of filled capsules at the same time using an equal number of empty shells as a counterpoise, changing the empty shells for different ones after one or two operations ³

The first method has the disadvantage of requiring too long a time, and it is not always possible to find a suitable solvent especially, when the capsule contains a mixture of powders

The second method mentioned also requires too much time and is not practical enough for use by the practicing pharmacist

The third method, consisting of emptying the contents of the capsule and weighing directly is better suited for general use, but here again too much time is consumed and in the case of adhesive powders it is almost impossible to remove all of the powder from the shell

The fourth method using the empty shell as a counterpoise, introduces the error caused by the variance in weight of the individual shells

* Section on Practical Pharmacy and Dispensing, A Ph A, Washington meeting 1934

¹ Assistant Professor in Pharmaceutical Chemistry The George Washington University School of Pharmacy In collaboration with Prof W P Briggs

² Private communication

³ Mathews, Norris W, Jour A Ph A, 22, 321 (1933)

The fifth method eliminates to some degree the variance of the empty shell, but the average weight of the filled capsules must be taken, therefore it is not a true measure of the individual contents

Experiments were carried out in an effort to eliminate some of the errors as pointed out in the foregoing methods and to find a method accurate enough and practical enough to enable the practising pharmacist to assure himself that, in the great majority of cases, his work is within the reasonable limit of error

A number of empty shells ranging from twenty to one hundred were taken at random from stock, and each batch was weighed carefully on an analytical balance. The average weight of the individual shells in each batch was determined and then the averages of these averages computed. This figure was used as the tare in all instances where this size of capsule was employed

In private communications with some of the leading manufacturers of empty capsules the writer was informed that the weight of empty shells of the same lot rarely varied more than three per cent of the average weight of the empty shell. One manufacturer stated that the weight of an individual shell never varied more than seven per cent. This variance was due, it was stated, to the variable viscosity of the gelatin and the moisture content of the air. An additional factor to be taken into consideration is that empty shells made by different manufacturers may show a difference in wall thickness and hence some variation in weight. One manufacturer stated that a 10% error would probably be the maximum. If this be true, then a No. 1 capsule which weighs approximately 80 mg. would show an error of 8 mg. or about $\frac{1}{10}$ of a grain, which would amount to about a 2% error in a 5 grain capsule.

The following table shows the result obtained by weighing different batches of capsules taken at random from stock:

TABLE I.—WEIGHT EXPRESSED IN GRAMS

Number in Batch	No 0 Capsule		No 1 Capsule	
	Wt of Batch	Average Wt per Capsule	Wt of Batch	Average Wt per Capsule
20	2 1748	0 1087	1 6670	0 0833
20	2 1642	0 1082	1 6540	0 0827
20	2 1780	0 1089	1 6704	0 0835
50	5 3830	0 1076	4 1590	0 0831
50	5 4010	0 1080	4 1165	0 0823
100	10 8230	0 10823	8 1200	0 0812
<hr/>				
260—Total				
Average weight per capsule		0 1083		0 0827
Maximum variation per capsule, av wt		0 0012		0 0023
<hr/>				
	No 2 Capsule		No 3 Capsule.	
20	1 3598	0 0679	1 0566	0 0518
20	1 3610	0 0680	1 0584	0 0524
20	1 3400	0 0670	1 0278	0 0513
50	3 3495	0 0669	2 5770	0 0514
50	3 4000	0 0680	2 4535	0 04907
100	6 7550	0 0675	5 2030	0 0520
<hr/>				
260—Total				
Average weight per capsule		0 0675		0 0513
Maximum variation per capsule, av wt		0 0010		0 0033

Observing the table it will be noted that the maximum variation in weight per capsule based on the average weight is in the case of the No 3 capsule. This variation is 3.3 mg or about five hundredths of a grain. Now by using the average weight 0.0513 this variation is reduced by about one half, so it could be considered as practically negligible.

Two prescriptions of 12 capsules each were used in Table II. In both cases the theoretical content of the individual capsules was exactly five grains. Two methods were employed in determining the actual contents of each capsule. Method A consisted of weighing the capsule directly on an analytical balance and then subtracting the average weight of the same size empty capsule, as determined in Table I. Method B consisted of emptying the contents of the capsule on to a tared watch glass and then weighing on the analytical balance.

TABLE II—THE WEIGHTS ARE RECORDED IN GRAMS

Theoretical weight of 5 grain capsule in Gm is 0.3240

Percentage error based on theoretical weight 3.888

Table II shows that in both instances, using the average weight of the empty shell as a tare, the results were nearer the theoretical. Furthermore, in a comparison of the weight of the contents of individual capsules, the weights obtained by Method A are practically uniform, being slightly higher than the individual weight obtained by Method B.

There are three general methods usually employed in filling capsules by hand. The individual weighing of each capsule is undoubtedly the most accurate method, but it is not practical for ordinary dispensing.

The two methods upon which the comparison of accuracy and speed are determined in this paper are

(1) *The Punching Method*, consisting of filling the capsule directly from the entire quantity of the material either by repeatedly punching the shell in the powder until filled or forcing the powder into the shell by the aid of a spatula.

(2) *The Blocking Method*, in which the material is divided into a uniform square and then into the desired number of divisions, the material in each division being placed in a capsule.

There are several factors to be taken into consideration in the comparison of the accuracy of these two methods. *First*, the comparison must be based upon the quantity of material per capsule, since it is uniform distribution of the material through the desired number of capsules that is important. To base it upon the theoretical average weight per capsule determined from the theoretical total weight of the ingredients would not be correct but would merely be a measure of the error.

in weighing plus the error in loss of material on the tile, etc. In the case of tolerance establishment this weighing error would be important, but not in a comparison of the accuracy of the two methods of filling. The true index as to the accuracy of filling then must be based upon the distribution of the material contained in the entire lot of capsules, not the amount that should have been placed in them. If, then, the average weight of the contents per capsule is based upon the actual weight of the total contents as determined by weighing on an analytical balance, we have a true estimate as to the quantity each capsule should contain. *Secondly*, the nature of the material would have some effect on the accuracy, so the prescriptions selected, bearing this in mind, consist of (1) a powder of medium weight and bulk, (2) a bulky powder, (3) a compact powder, (4) a mixture of bulky powders and (5) a mixture of heavy powders. *Third*, the comparison must be based upon the same prescription so every operator filled each prescription twice, once by each method.

The speed factor in hand-filling capsules is important enough in most cases to be considered, but it must not be intimated that accuracy should be sacrificed in order to save time. In determining the time required in the filling operation by the two different methods, it was assumed that since in each method the same weighing and triturations were necessary, the time would be the same. We therefore started measuring time from the point after complete trituration, at which the actual blocking or punching, as the case might be, was started.

The following prescriptions were filled by students of the senior class in Dispensing Pharmacy, at The George Washington University School of Pharmacy. The students were not told that the prescriptions were to be checked for accuracy but were instructed to fill the first prescription by the blocking method, the second by punching alternating until all the prescriptions had been filled. At another laboratory period the students were given the same prescriptions and instructed to use the opposite method in filling them than was employed before. In this manner each prescription was filled by each of the two methods and by the same student.

R 1	Acidum Acetylsalicylicum	5 i	R 4	Carbo Ligni	
	m ft Cap xii			Phenolphthaleum	aa gr ss
R 2	Quinæ Sulphas	gr xxxvi		Acetphenetidinum

R 3	Bismuthi Subnitrates	5 i		m ft Cap x	
	Ft Cap xii		R 5	Hydrargyri Chloridum Mite	gr vii
				Sodu Bicarbonas	gr xxxvi
				m ft Cap xii	

The following tables show the results obtained by each method of filling the prescriptions. In order to have some standard upon which to base the comparison as to the accuracy of the two methods, a ten per cent variance was arbitrarily selected, either plus or minus, from the theoretical average weight of contents per capsule.

SUMMARY OF TABLES III, IV V VI AND VII

Punching Method

Prescription Number	Number of Capsules within 10% Error Plus or Minus	Number of Capsules Having an Error Greater Than 10%	Time in Minutes
1	100	20	55
2	87	33	49

3	84	36	55
4	81	19	60
5	75	45	50
	—	—	—
Totals	427	153	269

Percentage of total capsules filled 73 6% 26 4%

Average time required to fill one capsule 27 6 seconds

Blocking Method

1	85	35	77
2	89	31	81
3	75	45	74
4	79	21	85
5	78	42	68
	—	—	—
Totals	406	174	385

Percentage of total capsules filled 70% 30%

Average time required to fill one capsule 37 2 seconds

The foregoing tables show a striking uniformity in the degree of accuracy, obtained by average operators, working under ordinary conditions and filling capsules by punching or blocking methods

As was expected, the punching method required about $\frac{1}{3}$ less time for filling than the blocking method

Another significant point is that out of the one hundred prescriptions filled only nine came within the arbitrary 10% limit of variance. Of these nine, five were filled by the punching method and four by the blocking method

CONCLUSIONS

(1) The comparative accuracy between blocking and punching of capsules is in direct ratio to the skill of the operator

(2) Considerably less time is required in punching than in blocking and with a comparable degree of accuracy

(3) The results obtained in this study, which do not contain the weighing error, clearly indicate that a tolerance of more than 10% should be established

(4) The average weight of an empty gelatin capsule obtained by the method herein described may be used as a tare in determining the weight of filled capsules

Major General Charles R. Reynolds, the new Surgeon General of the Army, received the degree of M D from the University of Pennsylvania in 1899. He entered the service of Medical Corps of the army in 1900 and served through the various grades to Colonel and entered upon his duties as Surgeon General June 2, 1935. He served in the Philippines and had a brilliant record during the World War, was awarded the Distinguished Service Medal and the Silver Star and is an officer of the French Legion of Honor. He has written

many professional papers having a bearing on military medical matters

Dr James F. Couch, chemist of the Bureau of Animal Industry of the Department of Agriculture and professor of historical science at the National University, has been elected president of the Chemical Society of Washington, D C

The New York Pharmacist with the April issue, became the property of the New York State Pharmaceutical Association and is now known as the *New York State Pharmacist*

DETERMINATION OF THE REASONABLE OR PERMISSIBLE MARGIN
OF ERROR IN DISPENSING V LIQUIDS *BY MARVIN J ANDREWS ¹

INTRODUCTION

In the first paper of this series, it was stated that the different types of prescriptions which the pharmacist is ordinarily called upon to fill may be divided, roughly, into two groups, namely, liquids and solids. The four papers presented to date deal only with the more frequently encountered types of the latter, *viz* Powders and Capsules (1), Ointments (2), Suppositories (3), and Pills (4). Thus, the fifth paper of the series, deals with Liquids.

Liquids called for on prescriptions are usually measured, the volume in most cases, being determined by using either a cylindrical or conical graduate. The possibilities for error in measuring a definite volume of a liquid are greater in number than is commonly held. Fortunately, most of them may be ignored as the error involved is too small to be of practical significance. In fact, only three need be considered for the purpose of this study. They are believed to be, in the order of their importance (1) the nature of the liquid to be measured, (2) the shape and size of the graduate used, and (3) the personal equation. To determine to what extent each of these factors is responsible for the total deviation from the standard, the studies reported in this paper were undertaken.

EXPERIMENTAL PART

For the purpose of the study reported in this paper, two series of tests were made. The object of the first was to determine the relationship, if any, between the size and shape of the graduate used and the magnitude of the observed error in the measurement of definite volumes. The object of the second was to determine to what extent the magnitude of error was effected by certain physical properties of liquids, such as color, viscosity, etc.

In the actual performance of these tests, the liquids were measured in both cylindrical and conical graduates by 100 members of the senior class in dispensing pharmacy at the School of Pharmacy of the University of Maryland. In each case the liquid was poured from a quart bottle into the graduate, held in the hand of the dispenser, then transferred to a prescription bottle. The contents of the bottle were again transferred to a tared container and accurately weighed on a chainomatic balance. The temperature of the liquids in both series of tests ranged from 22° C. to 25° C.

Each dispenser was assigned a definite number so the variation in the work of any individual could be followed throughout both series. The weight of all measurements is reported.

SERIES I

In the first series of tests definite volumes of distilled water were measured by the dispenser in 10-, 25-, 50- and 100-cc cylindrical and conical graduates

* Joint Session, Scientific Section and Section on Practical Pharmacy and Dispensing, A. P. H. A., Washington meeting, 1934.

¹ In collaboration with A. G. DuMez, Professor of Pharmacy, School of Pharmacy, University of Maryland.

The results of the first series of tests are presented in Table I

* Standard Deviation expressed in grams

¹ Percentage Deviation based on average weight

The tabulated data given in Table I shows there is an error due to the size and shape of the graduate. The magnitude of error is considerably greater when a conical graduate is used than when a cylindrical graduate is used. With respect to size just the opposite is true, the larger the graduate and the larger the volume measured the smaller the per cent of error. For instance in the measurement of 10 cc of distilled water in a cylindrical graduate the average error based on the standard deviation amounted to 2.34%. When a 10-cc conical graduate was used it amounted to 3.11%. That the magnitude of the error is greater when the smaller graduate was used than when the larger graduate was used is shown when the volume measured was 100 cc, and a 100 cc graduate was used in making the measurements, the average error amounted to only 0.78% in the case of the cylindrical graduate and 1.84% in the case of the conical graduate.

The error due to the personal equation is naturally indefinite. In fact, it was found to be impractical to attempt to measure it separately. The error is revealed by a definite trend in a series of measurements made by an individual rather than by the observation made on a single measurement. For example, in the series of measurements made by dispenser number 1 it will be observed that a majority of the measurements here were high when compared with the average, while those of dispenser number 10 were below the average.

No effort was made to determine what the personal equation was in these cases so that an accurate statement cannot be made concerning its nature. In some cases it may have been the result of defective vision, in others it may have been due to natural carelessness, in other instances it may have been due to using the upper meniscus at times and at other times the lower meniscus for making measurements, or to some other trait of the individual making the measurements.

The results presented in Table I are summarized in Table II, which follows. This table shows the actual number of measurements falling within the standard deviation and multiples thereof. Furthermore, the table shows the per cent of measurements falling within any one group, since the total number of measurements made in each case was exactly 100.

TABLE II—SUMMARY OF RESULTS PRESENTED IN TABLE I

Liquid to Be Measured	Volume Measured in Cc	Shape of Graduate Used	Average Weight in Gm	Standard Deviation in Gm	Number of Measurements Falling within			
					1 X S D	2 X S D	3 X S D	4 X S D or Over
Distilled Water	10	Cyl	9.561	0.224	78	19	2	1
Distilled Water	10	Con	9.606	0.290	70	25	5	0
Distilled Water	25	Cyl	24.481	0.503	85	9	4	2

Distilled Water	50	Cyl	49.258	0.727	74	22	3	1
Distilled Water	50	Con	48.758	1.203	69	26	5	0
Distilled Water	100	Cyl	98.240	0.767	83	12	3	2
Distilled Water	100	Con	97.881	1.802	67	28	5	0

The second series of tests was conducted to determine the effect of certain physical properties of liquids on the measurement of a definite volume. With this object in view the following liquids were selected:

(1) Elixir of Iron, Quinine and Strychnine N. F. as a green colored liquid, (2) Syrup, U. S. P., as a viscous clear liquid, (3) Milk of Magnesia, U. S. P., as an opaque liquid, and (4) Castor Oil, U. S. P., as an oily liquid.

To obtain comparative data, the same cylindrical and conical graduates used in measuring the 100 cc of Distilled Water in the first series of tests, were used in this series. The results of the second series of tests are given in Table III.

TABLE III—EFFECT OF CERTAIN PHYSICAL PROPERTIES OF LIQUIDS ON THE MAGNITUDE OF ERROR

Ether I Q S		Syrup		Milk of Magnesia		Castor Oil		Dispenser Num ber

* Standard Deviation expressed in grams

¹ Percentage Deviation based on average weight

The foregoing tabulation shows that errors are made in measurement and therefore the deviation from the standard is affected by the nature of the liquid measured. The magnitude of the error observed was in the following order: Distilled Water, Elixir of Iron, Quinine and Strychnine, Syrup, Milk of Magnesia and Castor Oil. The physical properties responsible for the great part were found to be color and viscosity.

The data presented in Table III reveal that color in a liquid has a tendency to increase the magnitude in error made in measurement, for example the average error for 100 cc. of Distilled Water measured in a cylindrical graduate is 0.78%, while that of the green-colored liquid, Elixir of Iron, Quinine and Strychnine is 0.89%.

A similar effect was observed with respect to viscosity. In the case of Distilled Water the average error was 0.78% as previously stated, whereas the average error found in the measurement of Syrup was 1.91%, and for Castor Oil was 4.49%.

The large error in the case of Castor Oil is no doubt due to the fact that the refractive index of Castor Oil is so near that of glass that the adherence of the oil to the sides of the graduate is not detected and not sufficient time is allowed by the dispenser for complete drainage.

Milk of Magnesia while not a liquid in the true sense of the word is nevertheless generally dispensed by volume rather than by weight, hence it must be measured. It was therefore included in this series of experiments. The comparatively large error found in this instance was no doubt due to the adherence of a considerable amount of the magnesium hydroxide to the inside of the glass graduate from which it was impossible to drain it, but could be readily seen. The average error amounted to 2.79% as compared with that of Distilled Water which was 0.78%.

The results of Table III are best summarized in Table IV.

TABLE IV—SUMMARY OF RESULTS PRESENTED IN TABLE III

Liquid to Be Measured	Volume Measured in Cc.	Shape of Graduate Used	Average Weight in Gm.	Standard Deviation in Gm.	Number of Measurements Falling within			
					1 X S D	2 X S D	3 X S D	4 X S D or Over
Distilled Water	100	Cyl	98.240	0.767	83	12	3	2

To make it possible to compare the results given in Tables I and III with similar data that may have been published, but which have not been expressed in terms of the standard deviation, the per cent deviation from the average weight has been calculated and is given in Table V.

TABLE V —PERCENTAGE OF ERROR COMPUTED FROM DATA IN TABLES I AND III

Liquid to Be Measured	Volume Measured in Cc	Shape of Graduate Used	Average Weight in Gm	1%	2%	3%	4%	5%	6%	7%	8%	9%	10% or More

NOTE All percentages are calculated from the average weight 1% = 1% or less, 2% = from 1% plus to 2%, etc

For the purpose of comparison with previously published data it is also desirable to have information showing the percentage of the total measurements in which the error falls below certain magnitudes, the latter being expressed in terms of per cent The following table is intended to accomplish this purpose

TABLE VI —TABLE SHOWING THE MAXIMUM PER CENT OF ERROR IN 90% OF THE MEASUREMENTS RECORDED IN TABLE V

Shape of Graduate.	10 Cc.	Distilled Water 25 Cc.	Distilled Water 50 Cc.	100 Cc.	Eliv I Q & S 100 Cc.	Syrup 100 Cc.	Milk of Magnesia 100 Cc.	Castor Oil 100 Cc.
Cyl	8%	5%	3%	2%	2%	3%	5%	8%
Con	8%	8%	5%	3%	4%	5%	6%	10%

CONCLUSIONS

1 The factors largely responsible for the errors made by pharmacists in the measurement of specified volumes were found to be three in number These are in the order of their importance (1) The nature of the liquid to be measured, (2) the shape and size of the graduate used, and (3) the personal equation

The error due to the personal equation naturally cannot be predicted with any degree of accuracy as it depends entirely upon the idiosyncrasy of the individuals making the measurements In some instances it may far exceed one or both of the other two factors but in all of the measurements made in the foregoing series of tests it exceeded twice the standard deviation in less than 7 per cent of all cases

2 From the data obtained in the tests made it would seem that twice the standard deviation is a reasonable margin of error for the measurement of the volume of liquids A margin of this magnitude will permit the acceptance of the following

Shape of Graduate	10 Cc	Distilled Water		100 Cc	Elix I Q & S 100 Cc	Syrup 100 Cc.	Milk of Magnesia 100 Cc	Castor Oil 100 Cc
Cyl	97%	25 Cc	50 Cc	95%	93%	94%	93%	93%
Con	95%	94%	96%	95%	95%	96%	95%	94%

UNITED STATES PATENTS GRANTED FOR MEDICINES DURING THE PIONEER YEARS OF THE PATENT OFFICE *

BY LYMAN F. KEBLER ¹

The word "patent" means open, not secret. A patent cannot be granted for a medicine of secret composition. The term "Patent Medicine" applied to a medicine of secret composition is a misnomer. The term in general conveys an erroneous impression. Many think that all proprietaries, foods and drugs, and medicines in package form, are of secret composition and consequently plain frauds. It is true that some outright medical frauds have been and still are perpetrated on the suffering sick. And this is true even in the case of a goodly number of medicines for which patents have been granted. Patenting a product does not preclude telling fairy tales about it. In fact, the therapeutic claims contained in the description of some of the patents for medicines are grossly false and fraudulent, as will be pointed out later.

SOME INTERESTING PHASES IN PATENTING MEDICINES

Secret medicines with their air of mysticism have held sway for the ages in all lands. The alchemistic era produced some of the most phony ideas in the matter of the philosopher's stone being a universal medicine and panacea. Secret medicines made marked advances during the time of iatrochemistry, when Paracelsus (1493-1541), with his *lapis infernales*, held sway, and John R. Glauber (1610-1770), the distinguished physician-chemist and discoverer of Glauber's salt, played such prominent parts. Glauber not only discovered the salt named after him but ascertained its medicinal virtues and sold it at a handsome profit under the name *sal mirabile*, for many years. It is claimed that he made a living selling secret medicines.

England set a precedent in granting patents to medicines. Among the earliest may be mentioned "Dr. Bateman's Pectoral Drops" (1726), "Dr. James' Fever Powder" (1747), "Ann Pike's Ointment for the Cure of Cutaneous Eruptions" (1760), and "Gale's Spa Elixir" (1782). The Ann Pike Ointment is probably one of the most glaring of frauds. It is a mixture of pomatum, lard, deer suet, calomel, Jesuits' bark, quicksilver, turpeth mineral, tutty powder, flowers of brimstone and "wood sut." The patent alleges that it is a "Grand Antidote for the Itch and All

* Section on Historical Pharmacy, A. P. H. A. Washington meeting, 1934.

¹ Former Chief of Drug Division, Bureau of Chemistry, United States Department of Agriculture.

Scorbutic Humors, a Sovereign and Efficacious Remedy that never fails all Errup-
trons and Cutaneous Disorders " The manner of use is to rub a quantity the
size of a pea, every night for a fortnight in the palms of the hands

In 1641 the General Court of Massachusetts Bay granted a 10 year patent for
a novel method of making salt The same province granted a patent for life for an
invention for warming houses Maryland issued a patent for a steam carriage in
1787 I have not come across a patent issued in favor of any medicine by any
Colonial Government It should be said, however, that secret medicines were
freely sold in the colonies, among them Gov John Winthrop's "Rubila," "Munson's
Mereurial Ointment" and "Digby's Sympathetic Powder" The latter had the
sanction of Harvard College

The colonists brought with them a demand for the remedies of their home
country The English Patent Medicines were as commonly used as laudanum and
castor oil Their nature and character were generally well known

THE BEGINNING OF PATENTS IN THE UNITED STATES

Our National Constitution gives Congress the power to "Promote the progress
of science and useful arts by securing, for a limited time, to authors and inventors,
the exclusive right to their respective writings and discoveries" The first law
under this provision was enacted April 10, 1790 It provided for a board consisting
of the Secretaries of State and War, the Attorney-General and the President
The Executive power was simply signatory The first board consisted of Thomas
Jefferson, Secretary of State, Henry Knox, Secretary of War, and Edmund Ran-
dolph, Attorney-General The first United States patent granted was issued to Sam-
uel Hopkins, July 31, 1790 It covers a process for the manufacture of "Pot and
Pearlash" No copy is available The earliest patent, of which a copy is available
and displayed in the patent office, was issued to Francis Bailey, January 29, 1791
It outlines methods for making punches, for manufacturing letters, and designs for
printing The patent was signed by George Washington, the President, Thomas
Jefferson and Edmund Randolph, Attorney-General No grant for any medicine
was issued under the law of 1790

A new law was passed in 1793 Up to 1802 the clerk in the State Department
handled all of the patent office work It is alleged that patents were granted for
apparently trivial and ridiculous inventions In this connection it is interesting to
note that the first United States patent, dealing with therapeutic matters, was issued
in 1796 to Elisha Perkins, a physician of Connecticut Its title reads ¹ "Removing
Pain, etc, by Metallic Points" The devices are usually referred to as "Perkins'
Tractors,"² and are ridiculed as the acme of fraud Yet, some of the leading physi-
cians of the times purchased and used them with apparent satisfaction There is
no copy of this patent available in the United States, the reason being that a dis-
astrous fire in 1836 destroyed the entire office, including the records, patents, draw-
ings and designs Fortunately, Congress published Indexes from time to time,
copies of which were filed elsewhere and were saved In these documents are pre-
served the titles of the patents issued

A patent for these tractors was granted³ in England to Benjamin Douglas
Perkins, a son of Elisha Perkins, March 10, 1798, under the title, "Apphcation of

¹ List of Patents Granted by the United States, 1790-1836

² Jour A Ph A, 22, 1142 (1933) ³ Specifications of Patents, England No 2221, 1798

Galvanism as a curative agent " The basis therefore was galvanism, that held such sway at the time The tractors most eminently efficacious for removing disease were claimed to be combinations of copper, zinc, with small proportions of iron, silver, gold or platinum The diseases enumerated, as most readily cured, are rheumatism, gout, pleurisy, inflammation, spasmodic affections and most topical complaints The patients were alleged to be cured by drawing these tractors over the parts affected, or contiguous thereto

A patent for "Bilious Pills" was granted in 1796, to Samuel Lee, Jr Four additional patents were issued, for pills, to four different persons in the nineties No copies are available The "Federal Index of Patents, United States Patent Office 1790 to 1873," by M D Leggett, Commissioner of Patents, is the most complete and satisfactory, of all consulted

The year 1836 is an outstanding one for the Patent Office, in a number of respects A new law was passed The numbering of patents was begun The first numbered patent is dated, July 13, 1836 The new law had not been in operation six months when the disastrous fire, referred to above, occurred, December 15, 1836 Congress shortly thereafter made provisions to restore the records as far as possible, and to have suitable quarters built for the work The old patents actually restored are extremely fragmentary, but they contain practically all of the available data on the subject, excepting that found in the Patent Indexes referred to above

During the period from 1790 to the new order of things in 1836, about seventy-five patents were granted covering Pills, Medicines, Ointments and Salves This means less than two patents a year, but the majority were issued during the last half of the period Most of the drugs were listed simply as medicines, but a fair proportion are more definitely characterized, as is indicated by the following

Name of Medicine	Date	Patentee	Name of Medicine	Date	Patentee
Removing Pain Etc by			Ointment	1816	William Judkins
Metallic Points	1796	Elisha Perkins	Medicine for Toothache	1817	J Utley

* A copy each of the patents for the medicines starred above will be found in the "Restored Patent" volumes, in the Patent Office Library They are all in longhand The John Cullen process patent for "Liquid Magnesia," granted May 4 1818 is the earliest of the patents restored for medicines

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS
DEPARTMENT

Food, drug and cosmetic legislation seems to be at a standstill at the time this note is written. Our efforts to secure the needed provision to protect the consumer under present conditions have been blocked by interested parties whose activity would be curtailed if the proposed bill becomes a law. Public sentiment should be aroused to the point where Congress will have to recognize it. We have no objection whatever to a revision of S B 5 provided the revision is for the best interests of the consumer and also reasonable from the standpoint of the manufacturer and distributor. We are however opposed to revisions that will nullify the bill. Ralph W. Clark of the University of Wisconsin along with many others has been active in bringing this bill to the attention of the retail pharmacists and the public. The following radio address by Dr. Clark is a sane presentation of the situation.—C B JORDAN *Editor*

NATIONAL FOOD AND DRUG LEGISLATION *

BY RALPH W. CLARK **

Our social order has entered a period of accelerating change. Notwithstanding this fact, the attempt last year represents the first far-reaching effort since 1906 to augment the legal safeguards of the consumers of foods, drugs and cosmetics.

In a simple agricultural society the problem of the supply of these commodities devolves, more or less, upon every family. In the present industrial society a large proportion of the population is entirely dependent upon the general market. There is, therefore, a need for more stringent regulation of foods and drugs and the inclusion of cosmetics and advertising which are not mentioned in the 1906 Food and Drugs Act.

The first step in food and drug legislation was taken in 1850 when a law was passed which classified various kinds of tea. One year later the AMERICAN PHARMACEUTICAL ASSOCIATION was organized "to improve and regulate the drug market by preventing the importation of inferior, adulterated and deteriorated drugs and by detecting and exposing home adulterations." This organization, as well as the American Association of Colleges of Pharmacy, the National Association of Boards of Pharmacy, the National Association of Retail Druggists, and the Wisconsin Pharmaceutical Association, favors the present bill, the essential points of which will be outlined shortly. Last year, due to a misunderstanding, pharmacists were classed as opponents to the bill. They did oppose some portions of it which they thought were unreasonable and which have since been modified. They favor the present legislation as they have in the past favored desirable legislation which had to do with public health.

From 1879 to 1906, when the present Food and Drugs Act was passed, 190 measures were presented in Congress which were designed in some way to protect the consumer. Very little active interest in favor of such legislation as well as powerful opposition thereto resulted in only eight of these measures becoming laws.

* Radio Station WHA Home Maker's Hour—May 15 1935

** Instructor in Pharmacy, University of Wisconsin, Chairman, Inter-Professional Relationship Committee, Wisconsin Pharmaceutical Association

When the fight, just before 1906, was at its height, the name of Dr Harvey W Wiley was associated with various newspapers and magazines in exposing many existing evils and urging legislation to correct them. How different is the situation now when newspapers, magazines and radio are not favoring, but in many cases opposing this legislation, at least by not bringing information on it before the public. It is encouraging to have read early this year in the *Nation* and the *Milwaukee Journal* comments favorable to the proposed legislation. *Time*, however, recently made somewhat of a joke over the fact that the present Copeland Bill had been indefinitely postponed.

Credit should be given to the book, "100,000,000 Guinea Pigs," for stirring up an interest in the need for this type of legislation. Its authors, however, in writing the book, a best seller a year or two ago, and in operating Consumer's Research, are no less financially interested than manufacturers of foods, drugs and cosmetics. Many of the statements made are radical to say the least and should not influence the consumer too much. After all, it is home operation of an electric refrigerator or car and not laboratory tests that decides the value of the product. Certainly most manufacturers, the ones who intend to stay in business, undertake to market a product only after assuming the responsibility that their product is of high enough quality to be safe for consumer use and will be what they claim it to be when the consumer uses it for the purpose for which it is intended.

For the past few years, however, there has been a rapidly growing public recognition of the need for a revision of the Law of 1906 to better control the unscrupulous manufacturer. Court decisions have revealed weaknesses in the measure that were not foreseen when it was enacted, yet few substantial alterations of the existing Law have been made. In June 1933, Senator Copeland introduced a bill, S 1944, known as the Tugwell Bill, intended to strengthen and extend the Federal Food and Drugs Act of 1906. A storm of protest arose against the bill and it was twice revised, first as S 2000 and later as S 2800. Although the bill was reported favorably by a sub-committee of the Committee on Commerce, it was not acted upon in the last Congress because of the brief time between its favorable report and adjournment, because of the press of other legislative matters and because the revisions had not served to allay powerful opposition from some elements of the regulated industries.

Since the last session of Congress Senator Copeland has spent much time in revising and perfecting the measure which was introduced into this session as S 5 and is now popularly called the Copeland Bill. Following hearings held in March 1935, the bill was again favorably reported to the Senate. The provisions which aroused most opposition have been rejected. Chief among them was the one giving the Secretary of Agriculture extensive power in rule-making. The Secretary must, in the revision, which at the moment has been indefinitely postponed, consult the proper advisory committee, one on Food and one on Public Health, to be appointed by the President, and have its majority vote before establishing any regulations for the enforcement of the Act.

The bill now contains the valuable features of the present law. Its principal differences from the present law lie in the elimination of those provisions whose terms have caused courts to make interpretations that have afforded avenues for escape for the unscrupulous, extension of its provisions to cosmetics and advertis-

ing, amplification and reinforcement of certain provisions to safeguard public health and to promote honesty and fair dealing, and to strengthen its procedural provisions better to effectuate its purpose

The Copeland Bill contains definitions of foods, drugs and cosmetics which are broad. There has been no difficulty experienced with the definition of a food, but the term drug has now been made broad enough to include mechanical devices, while the definition of the term cosmetic is inclusive enough to embrace all substances, other than ordinary toilet or household soap, intended for cleansing or altering the appearance of, or promoting the attractiveness of the person. The bill prohibits labeling of foods, drugs and cosmetics in any manner which is false or misleading in any particular and every label must bear the name and place of business of the manufacturer. The latter inclusion is intended to prevent the sale of commodities under labels which remain silent with respect to the sponsorship of the products, or which utilize merely fictitious names, and to establish responsibility for statements used in advertising. The language of the bill is designed to prevent the use of claims of misleading breadth and to require, in the case of drugs, that all representation be limited to the actual value of the drug. In general, misbranding is designed to apply to all misrepresentation of whatever kind, whether of origin, identity, quality, effect or other description of property.

The definitions of standards in the bill are broad and delegation of power to make further regulations such as may become necessary are provided for in the manner previously mentioned. Adulterated is the term applied to products to which substances have been added which are in themselves harmful. An adulterated food, drug or cosmetic is, therefore, one which contains a substance which may render it dangerous to health under the conditions prescribed for its use. Certain color and other tolerances are set up and still others may be promulgated by the Secretary with the approval of the proper advisory committee.

Advertising, as you all know from seeing and hearing it, needs considerable attention. Much of it is based upon the motive of fear—fear that one will lose his position unless he sleeps on a certain kind of mattress or drinks a certain kind of coffee, fear that he will be ostracized from society if certain mouth washes are not used to purify his breath, fear that a child will not be well if he is not given certain beverages and food—all these and many more call to mind specific advertising seen and heard regularly. This sort of thing I hope and believe will be cleared up if the Copeland Bill becomes a law. It should be remembered, too, that half-truths are more pernicious than falsehoods. The bill requires that statements used on the package, in the newspaper, in the magazine, and on the radio, must be statements of fact when the product is used as specified. If, for instance, the word antiseptic is used in describing a product, it must meet the test required in the bill for an antiseptic under the conditions indicated.

I have two small children at home. It is irritating to me to read or hear advertising stating that I am experimenting with them unless I use certain products for appetite-stimulators or for the treatment of colds and other so-called minor ills. I know full well that I really am experimenting unless they are seen regularly, whether sick or well, by a physician who has the training, the experience and the apparatus to check up on their general condition, and, in the case of colds, to listen to their lungs and inspect their ears and throats.

It should be pointed out that the manufacturer who is interested is treated fairly in that he may ask and receive a court review of the regulations handed down by the Secretary of the Department of Agriculture. The Act, by the way, should be administered in this department, rather than by the Federal Trade Commission, as proposed in certain other bills on this subject before this session of Congress. The Federal Trade Commission is regularly occupied in issuing cease and desist orders for unfair trade practices and not in deciding what products are good for the public health.

In conclusion let me quote from *The Milwaukee Journal* editorial "In general the Copeland Bill is right, and it would result in more effective protection to the public than does the present law." It is therefore necessary for you home-makers to take an active interest in securing the passage of the Copeland Bill. As I have said before, this bill¹ has now been indefinitely postponed but may be brought up again at any time. The present attempt is in danger of again not becoming a law and the much-needed legislation will be successful only if sufficient consumer interest can be aroused.

¹ The Copeland Bill (Federal Food, Drugs and Cosmetic Act) was passed by Senate, May 28, 1935, and referred to Interstate and Foreign Commerce, May 31, 1935.

Crater Lake, in Crater Lake National Park, is known as one of the "Seven Wonders of the World."

Crater Lake in Crater Lake National Park is considered one of the wonders of the world. To one historically minded, Oregon has an extra charm. The winning of the Pacific Northwest—the states of Oregon, Washington, Montana, Idaho and Wyoming—is a story with Oregon its focal center. It was at Champoege, a little spot on the Willamette 30 miles above Portland, that a provisional government of the Oregon country under the Stars and Stripes was declared on May 2, 1843. At the mouth of the Columbia River a hundred miles from Portland lies Astoria, the first settlement in Oregon, founded by John Jacob Astor in 1811, a community that fell to the British in the War of 1812 and was recovered six years later. A few miles beyond lies Seaside, where Lewis and Clark reached the end of the trail. Just across the Columbia from Portland stand Vancouver Barracks where General Grant and others of his day served as lieutenants and captains. Monuments, statues and shrines mark these places.

The world-famed Columbia River Highway starts eastward through the wondrous gorge of the Columbia from the very edge of Portland. An hour's drive carries you to some of the greatest scenic spots on this magnificent drive to the Vista House perched on the top of a mighty cliff some 700 feet straight above the great river where you may look out over a vast stretch of Oregon and of Washington lying just across the stream, to Multnomah Falls leaping down a sheer 625 feet in a roaring, mystic white. Words are futile in describing the magnificence, the awe inspiring grandeur of this highway hewn out of the towering rock-walled gorge which the river cut through the Cascade mountain in endless centuries of toil.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council "

—Part of Chapter VI, Article VI of the By Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association "

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates "

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

CHICAGO

The last monthly meeting of the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION for the school year of 1934-1935 was held May 14th at the University of Illinois College of Pharmacy The speaker of the evening was Dr Frank B Kirby of the Abbott Laboratories

The 'Kirby Group Plan' was presented by President Webster The plan has as its aim monthly meetings that will interest the retail druggists The meeting time would be divided into definite periods with definite topics and would last in the neighborhood of two and one half hours

A lively discussion followed the presentation of the plan and the group present voted to accept the offer of Dr Kirby to send a copy of the plan to the members of the Branch so as to get the opinions of those interested in the plan as to whether such an organization should be started in Chicago

Dr Kirby was presented, and discussed "Diseases of the Head "

The discussion was divided into three subdivisions namely (1) The Eye, (2) The Nose and (3) Hay Fever

The Eye —Dr Kirby stated that the pharmacist should be in a position to render the eye specialist some kind of special service As a suggestion, the stock in the store pertaining to eye medication could be arranged in special shelving Then the druggist could pose as catering to this special field The necessary equipment should be obtained to properly fill this type of prescription and signs should be displayed giving the impression that you are paying particular attention to the filling of prescriptions involving the eye

You are now in a position to make a personal call on the eye specialists It was suggested that at least six specialists and a population of 200,000 is needed before a special department should be established

Twenty of these departments have been established in stores through the help of Dr Kirby

The Nose —Dr Kirby made a plea for professional recognition of colds in the head Large companies have been making intensive surveys of the loss of time by employees due to colds in the head No one has come along with a specific for colds in the head

It was suggested that a professional window, depicting that the physician can render aid where common remedies fail be displayed Part of the window space can call attention to bacterins These are injected by the physician but indirectly create good will with that profession A minor part of the display can be devoted to vitamin A making mention of the reasons why it should be taken during the seasons when colds are easily acquired

Hay Fever —Two million people suffer annually from hay fever in this country

Two opportunities await those dispensing hay fever medicines *First*, there is the pre

ventive medicine that is appreciated by the sufferers and one may start treatment prior to August 15th, say about the middle of June

In many cases known sufferers may go through the entire season with relief if they take injections of the correct pollen extract before the air becomes contaminated with it

About 10% of the suffering comes from hay, mainly timothy, and sometimes blue grass About August 15th, the chief offender, the ragweed, comes along

A suggestion was made that a ragweed be placed in the window as very few people know what it looks like Show how pollens are marketed, the syringes, and a chart showing the pollen content of your territory These charts are easily obtained

Such a window was placed in a Chicago loop drug store and attracted so much attention that it was left in for a much longer period of time than had originally been planned

During the first part of August a curative window should be displayed There will now be new victims and those sufferers who did not take the June treatment The display will be of a remedial nature and should show sprays, nasal douches ephedrine preparations eye preparations and vitamin A products A full grown ragweed could be shown with blue glazed glass or blue glazed paper below which will show the pollen as it falls from the plant These windows are known to have given results according to Dr Kirby The meeting was closed with an open discussion and with a rising vote of thanks to Dr Kirby for his interesting discussion

LAWRENCE TEMPLETON, *Secretary*

NEW YORK

The May 1935 meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on May 13th, in the College of Pharmacy of Columbia University, New York About thirty members and their guests attended Dr Charles W Ballard presided, the minutes of the previous meeting were read and approved Treasurer Currens reported a balance on hand

Chairman Lehman of the Committee on Education and Legislation then reported as follows

"Fair Trade Stabilization has lost a valuable friend and ally in the accidental death of Clyde Kelly, former congressman from Pennsylvania

The Copeland Food and Drug Bill S 5 It will be several weeks before this measure may come up Rumor has it that a compromise has been effected and that the bill will come up in an amended form

American Retail Federation Recent press release announces the formation of this super-trade organization, which is supposed to represent over one million retailers in the United States, the Executive Committee of the organization consists of

"Louis Kirstein Department store operator in Boston, George M Gales of Liggett & Co , C W Kress, Five and Ten Cent Stores, F Lazarus, Jr department store operator in Columbus, Ohio, A H Morrill, of the Kroger Grocery & Bakery Chain, Samuel Robinson of American Stores, Lessing Rosenwald of Sears, Roebuck & Co , E C Sams, of J C Penney Co , H J Tilly of the Retailers National Council

"General Johnson on April 18th asked How much voice is the little fellow going to have in such an organization?"

'An investigation of this Retail Federation has been authorized by unanimous vote of the House of Representatives and is being conducted under the chairmanship of Congressman Cochran of Missouri and six other members, including Congressman Cole of New York Pharmacists and others are asked to write to the chairman of the Committee stressing the need of statutory protection by small business men against monopolistic tendencies in distribution

'The New York State Prophylactic Bill (Stewart Bill) was signed by Governor Lehman, on May 9th and is now a law

"The Fair Trade Bill was passed by the Senate some time ago, and during the last days of the Legislative session by an enormous majority in the Assembly but so far has not been signed by the Governor

"An organization favoring Price Stabilization of Trade Marked merchandise is the Allied Retailers Association consisting of

'The New York State Pharmaceutical Association The New York State Retail Food Merchants, The New York State Retail Meat Dealers The New York State Retail Jewelers, The New

York State Retail Liquor Package Dealers, The Paint Dealers Protective Association, the Retail Dealers of America, representing 174,000 retail outlets in the State of New York.

"A meeting of this organization will be held at the Hotel Pennsylvania in the interest of the adoption of the Feld Crawford Fair Trade Bill, on the date of Wednesday evening, May 15th. Every local organization affiliated with the N Y Pharmaceutical Association is entitled to one official delegate to this meeting.

"From Bruce Philips Bulletin we see that the 'Medical Society of Greater New York (?)' is seriously discussing the question of a standardized home and office visit charge by the physician to the needy in that section. Suggested fees to be \$1 00 for office and \$2 00 for house visits.

"It is suggested that physicians at the same time should consider economies in the matter of prescription writing, and call for U S P and N F Remedies, instead of expensive proprietaries.

"The New Booklet of the U S P and N F Propaganda Committee of the New York State Pharmaceutical Association, under the chairmanship of our member J Leon Lascoff, is now ready for distribution. The book contains information for the physician about official preparations, their strength, dosage and therapeutic value also a large number of suggested prescriptions 50+ pages, price 25¢ per copy.

"Alcohol regulations permitting the sale at wholesale of alcohol in containers of two or more gallons have gone into effect. Those pharmacists in N Y State who have a \$1 00 license can only purchase in containers as designated.

"Seizures and dismantling of stores violating the federal alcohol laws have been moderated so as to provide a hearing for the accused before indulging in the drastic action heretofore exercised by the officials."

In view of the fact that since the meeting the NRA has been declared unconstitutional all references to NRA and code provisions have been omitted from Mr Lehman's report.

A letter from Samuel Hilton, Remington Medalist for 1935 was read. This letter brought on a discussion concerning the actual presentation of the medal. In this discussion Dr Schaefer, Mr Currens and Dr Newcomb took part. It was finally moved and approved that the secretary and the Executive Committee would be empowered to arrange for the presentation either in Washington or in New York City, according to Dr Hilton's wishes. In the event that the presentation would take place in New York City the program would be patterned after the procedure followed at the time of the Remington Medal presentation to Dr E F Kelly.

President Ballard appointed Samuel C Henry and Mr Fred C A Schaefer to act as Branch delegates at Delegates' meetings of the New York Pharmaceutical Council. Professor Otto Canis, of Fordham University, and Mr Jacob Selcy were appointed to act as alternates. In connection with this Dr Schaefer suggested that the report of the Council Delegates be made a regular part of the Branch meeting program from now on.

Dr Ballard then introduced the speaker for the evening, Dr Robert P Fischelis, president of the AMERICAN PHARMACEUTICAL ASSOCIATION, whose address was entitled "The A P H A — Shall It Remain a Symbol or Shall It Become a Living Thing?"

Dr Fischelis began his address by pointing out that for nearly eighty-three years the pharmacists of the United States have looked up to the A P H A as the personification of everything they would like pharmacy to represent in the highest and most professional sense. In spite of this the membership represents less than three per cent of the pharmacists of the United States. He emphasized the fact that the ASSOCIATION remains something distant and hazy in the minds of most pharmacists from a strictly practical sense.

In more recent years developments in pharmacy have forced pharmacists to consider relations and to question all things and have focused attention upon the men and things responsible for the conditions which surround every phase of our profession and industry. In attacking these various problems they have evolved new units in American pharmacy to grapple with the various problems. In the meantime the A P H A instead of making use of its power to assist in the evolution of American pharmacy has calmly sat by and permitted new organizations to come into being. In this sense it has completely failed to assume the responsibilities which it justly should have and has even encouraged and fostered the growth of new organizations to handle specific problems. It is the argument of Dr Fischelis that this is a great pity, for it has permitted a decentralization of power in American pharmacy with various groups pulling in different directions.

He pointed out particularly that the original organization as set up of the A P H A was

such that no changes would be necessary in order to assume the various responsibilities, both professional and economic, which confront the industry. It is his opinion that in their conservatism the leaders of the ASSOCIATION have leaned over backwards.

In calling attention to some of the problems which the ASSOCIATION should rightfully have handled, Dr. Fischelis cited that in many instances the good name and prestige of the A. P. H. A. had been used by numerous organizations as a means of furthering their program and gaining wider recognition. He stated that every single one of these organizations which has endeavored to capitalize on the prestige of the A. P. H. A. always has capitalized on objectives, to which the A. P. H. A. could have and should have directed its attention, if it had been a living thing and not merely a symbol.

In criticizing the ASSOCIATION for failure to assume its rightful place in American pharmacy, Dr. Fischelis stated that both inertia and the force of reactionary elements within the ASSOCIATION were responsible for the inactivity.

Before proposing a remedy the speaker carefully explained the present set up of the ASSOCIATION and pointed out how provision was actually already there for assuming leadership in both the professional and economic fields of the industry. He went on to explain how a closer tie up could be arranged between the State Association, the A. P. H. A., the N. A. R. D. and the local A. P. H. A. Branches which would make it possible for a single membership fee to provide adequate revenue for these various units. With such a set-up organizations like the Drug Institute would be wholly superfluous and it was Dr. Fischelis' opinion that if the large sum of money collected on behalf of that organization had been poured into such a set-up it would have been more productive of results since no salaries up to twenty-five thousand dollars a year would need to be paid.

In closing, Dr. Fischelis called attention to the power and unity represented in the medical field by the American Medical Association and the influence which this organization wields over advertising in the pharmaceutical field as well as physicians.

In the discussion which followed, A. W. Pauley of the Drug Center of St. Louis stated that he believed that the Drug Institute filled a place which other organizations could not. He claimed that individual associations had their own responsibilities and that the present set up might better continue. He was particularly interested in calling attention to the Retail Federation which he claimed could easily destroy the independent retail druggist and called upon every retail unit to fight this new movement.

C. V. Michaels, of the Drug Institute, very briefly called attention to some of the work being done by the Institute and pointed out that this body had contributed something in awakening other organizations to their respective responsibilities.

Secretary Newcomb, of the New York Wholesale Druggists Association, believed that a furthering of the activities of the AMERICAN PHARMACEUTICAL ASSOCIATION would weaken the professional standing of that organization. He pointed out that in reality, two kinds of drug stores were making their appearance, one a strictly professional and ethical prescription pharmacy and the other a miniature department store. He believed that the AMERICAN PHARMACEUTICAL ASSOCIATION would best fill its place in American pharmacy by retaining its active interest in the professional and scientific side and not by entering into the business field.

President David I. Cohen, of the New Jersey State Pharmaceutical Association, claimed that more active workers were needed in the field and that the industry required consolidating of its various forces.

Dean H. V. Arny pointed out that the AMERICAN PHARMACEUTICAL ASSOCIATION was an extremely conservative pharmacy organization and had in more recent times broadened its interests. He also stated that the House of Delegates had failed to fully function. Referring to Dr. Fischelis' statements concerning the solidarity shown in other professional fields it was Dr. Arny's opinion that this was not exactly true, and that the solidarity was not as great by any means as it appeared to be on the surface.

At the close of the discussion a rising vote of thanks was accorded the speaker and all those who took part in the discussion.

RUDOLF O. HAUCK, *Secretary*

PHILADELPHIA

The May meeting of the Philadelphia Branch, AMERICAN PHARMACEUTICAL ASSOCIATION was held May 21, 1935 at the Philadelphia College of Pharmacy and Science, President E H MacLaughlin in the chair

The speaker of the evening Dr Robert P Fischelis, president of the AMERICAN PHARMACEUTICAL ASSOCIATION, spoke on "The AMERICAN PHARMACEUTICAL ASSOCIATION and the Future of American Pharmacy" Dr Fischelis's speech was one of the most interesting heard during the past year He emphasized the pitfalls of American pharmacy and the need of whole hearted cooperation on the part of pharmacists throughout the United States, if they hoped to survive the great wave of influence which is tending to degrade pharmacy and to eliminate the individual pharmacist

He stressed the importance of the organization of pharmacists into one powerful cohesive group, pointing out that the AMERICAN PHARMACEUTICAL ASSOCIATION, with its present set-up, was able to cope with any major Pharmaceutical problem He emphasized the need of a new type A PH A JOURNAL—one that would hold interest and be helpful for the pharmacist as well as the scientist

A rising vote of thanks was given Dr Fischelis in appreciation of his most valuable talk

Respectfully submitted,

GEORGE E BYERS, *Secretary*

(Concluded on page 521)

A PHARMACEUTICAL STUDY OF p_H

BY FREDERICK F JOHNSON

(Concluded from page 412 May Journal A Ph A)

 p_H AND STABILITY OF GALENICAL PREPARATIONS

Digitalis Preparations—The question of p_H and digitalis stability has been a matter of controversy for many years and is far from settled at the present time Hintzelmann and Joachimoglu (89) stated that the tincture was most stable in an acid medium Emig (238) reported that tinctures prepared from menstruums of p_H 4.5–5.2 showed the least loss in potency although the initial potency was less than for normal tinctures Rowe and Scoville (248) stated that adjustment of the tinctures to p_H 4.0 with hydrochloric acid increased the stability and later stated (289) that tinctures of p_H 3.0 were more stable than those of p_H 6.0 or 7.0

In contrast to these results, Haag and Hatcher (127) reported that HCl decomposed constituents of digitalis, Wokes (187) reported that acidifying did not increase stability, Haag and Jarrett (206) reported that no definite relation existed between the activity of the tinctures and p_H , and Foster and Van Dyke (264) stated that the most stable tinctures were those of highest p_H

Hintzelmann and Joachimoglu (83), (42) reported that alkalinizing the tinctures with NaHCO_3 greatly increased deterioration, while Wokes (187) reported that the addition of Na_2CO_3 caused very little deterioration Joachimoglu and Bose (65) reported that the addition of tartaric acid increased the stability Rowe and Scoville (248) reported that the addition of hypophosphorous acid as a reducing agent was detrimental It seems to be definite that the addition of anhydrous sodium acetate or anhydrous sodium sulphate as antihydrolytic agents does result in increased stability (248), (289) (301)

Several investigators have reported that stability is increased by destroying the ferments of the crude drug or preparations by heat (95) (248) (289) Rowe and Scoville (289) reported that tinctures prepared from a 77% alcoholic menstruum were more stable than those prepared from an 87% menstruum, but Stasiak (329) claimed that absolute alcohol tinctures were more stable than 70% alcohol tinctures Macht and his co workers (88), (98), (99) stated that ultraviolet light and polarized light hastened destruction of the tinctures, but Bond and Gray (108) claimed that no destruction was produced by exposure to either light

There is plenty of evidence that the crude drug, tincture and infusion tend to become more acid during storage (92), (162) (214) Krantz (163), (274) has determined the buffer capacity of the tincture as 0.009 between p_H 5.75–2.50, and as 0.012 between p_H 5.75–9.50, 5.75 being the p_H of a U S P tincture He further stated (243) that the acids of the leaf are probably combined

with potassium and are extracted by the alcohol water mixture yielding a system having a high buffer capacity, consisting of a strong base combined with a weak acid, and also some slightly dissociated acid

Carr and Krantz (308), while investigating for the Revision Committee of the U S P XI, arrived at the following conclusions concerning the tincture of digitalis The official tincture has a pH of 5.50-6.00 Considering the manner of dosage, it is a stable product There is no distinct evidence that its stability can be increased by buffering or by adding acid to the product

Concerning infusions of digitalis, the consensus seems to be that preservative agents increase stability, that the infusions become more acid with age, and that a neutral infusion is most stable (77), (92), (214) The infusion is less acid than the tincture

Ergot Preparations—In 1926 an article in the *Public Health Reports* (79) stated

‘In order to insure the stability of the liquid extract, the hydrogen ion concentration should be adjusted within the limits represented by pH 4.0 and pH 5.0 The extract should be sterilized and sealed in ampules of non-alkaline resistant glass’’

The pH of the U S P Fluidextract of Ergot is approximately 4.5 In the last few years there has been a great variety of opinions concerning the efficacy of further reductions of the pH The confusion in the literature is augmented by the undependable results of the various assay methods

Six investigators have concluded that adjusting the pH to about 3.0 favors stability of the fluidextract and the alkaloid solutions (138), (188), (229), (247), (288) (306) These workers disagreed, however, concerning which acid was most effective Powell and his co workers (247) favored tartaric acid, Rowe and Scoville (288) favored reducing acids and Bernerowna (306) claimed that phosphoric acid was best Swanson (250) stated that a pH of 3.0 appeared to favor stability of the fluidextract, hypodermic solutions of ergot, and alcoholic solutions of ergotamine tartrate, but that the results were very questionable and no conclusions could be drawn Three investigators (227), (269), (294) reported that lowering the pH either did not increase stability or resulted in even more decomposition

Smith and Stohlman (227) reported that the addition of 2.5% sodium thiosulphate or 2.5% sodium hyposulphite or 1% cysteine hydrochloride as reducing agents to the fluidextract or alkaloid solutions favored stability if above pH 5.0 Bartsch (191) claimed that ergotamine tartrate was most stable at pH 2.04 Bernerowna (306) stated that of the various salts of the ergot alkaloids, the organic salts were most stable, and the sulphuric acid salts were more stable than the hydrochloric acid salts Wokes and Elphick (188) claimed that for proper extraction of ergot, the pH of the menstruum must be not less than 5.4

Aconite Preparations—The attempts to stabilize aconite preparations by adjusting the hydrogen-ion concentration have been quite successful Swanson (64), (69), (105) performed the original work and recommended that the pH values of the tinctures and fluidextracts be adjusted between pH 2.5-3.00 Without addition of acid the pH of the U S P tincture lies between 5.1-5.6 By lowering the pH , Swanson was able to decrease the deterioration from 90% to 5% He pointed to the discrepancies in the assay methods as deterioration increases The chemical assay at no time showed any loss of potency, the guinea pig and white mice methods were concordant for standard preparations but the difference between the two increased as deterioration progressed

Haag and Hawkins (155) thoroughly verified the results of Swanson Baker (304) also agreed with Swanson and established the optimum pH range for all aconite preparations as pH 2.3-3.0 He recommended the use of hydrochloric acid rather than a reducing acid like hypophosphorous acid He also reported that all of the tinctures became decidedly less acid during storage The only disagreement to the established optimum pH range was put forward by Munch and Pratt (282) who claimed that adjusting the pH to 2.5-3.10 did not increase the stability of the tincture or fluidextract

Carr and Krantz (308) recommended to the Revision Committee of the U S P XI the adoption of the pH range 2.5-3.0 for Tincture of Aconite It was reported that if the tincture is acid to methyl orange and shows an orange color with thymol blue, it will be within the stable pH range Carr and Krantz reported the buffer capacity of Tincture of Aconite as 0.0086 in the acid range This is very close to the buffer capacity of Tincture of Digitalis which is 0.0090

Miscellaneous Vegetable Preparations—Krantz and Slama (97) reported that the precipitation in the Compound Tincture of Gentian could be minimized by adjusting the reaction to pH

70 The official tincture has a pH of 5.2 The precipitate was composed of starch, gentian sugars and albuminous material Begun (120) found that by exposing the crude gentian to hot alcohol vapors, the hydrolysis and inversion of gentian sugars and glucosides were considerably reduced

Swanson and Hargreaves (118) (182) have studied the effect of the hydrogen ion concentration upon veratrum, gelsemium and nux vomica preparations The optimum pH for both the fluidextract and the tincture of veratrum was between pH 4.3-4.8 The pH of the U S P IX fluidextract is 5.0 and of the U S P X tincture, 5.4 The N F Fluidextract of Gelsemium of pH 3.45 was stable and remained so when the pH was reduced to 1.0 The N F Fluidextract of Nux Vomica of pH 5.30 was stable and remained that way when the pH was reduced to 0.75

Lichtin (215) reported that acidifying the menstruum or percolate of Tincture of Cinchona did not increase stability Canes and Evers (260) have reported concerning the loss of color in mixtures containing the B P Compound Tincture of Cardamon From pH 7.0-9.5 the mixtures were stable in the dark but fading occurred in the dark at higher pH values Calcium salts caused precipitation of calcium carminate at pH 4.0 and above

Scoville (103) has studied the effect of acid upon the precipitation in many of the less important tinctures The acid increased precipitation of red cinchona, aloë, frangula, juglans, rhu barb, senna, rhus glabra, quercus, wild cherry and stillingia It retarded precipitation of cinchona calisaya, castanea, geranium and rose Sodium acetate retarded precipitation of aloë, frangula, scenna, chionanthus, glycyrrhiza, salix nigra and sassafras It seemed that the tannin-containing drugs were especially prone to precipitation by hydrolytic action Krantz (162) reported that Fluidextract of Cascara becomes slightly more acid upon standing and that Elixir of Iron, Quinine and Strychnine becomes much less acid upon standing irrespective of the type of light to which they are exposed

Turner (230) stated that the syrup and mucilage of acacia rapidly decompose because of the development of acidity Attempts to produce acid free preparations by heat sterilization and the use of preservatives were unsuccessful Eschenbrenner (199) has reported that infusions of ipecac can be stabilized if prepared with dilute hydrochloric acid and 15% alcohol This corresponds to the U S P acid fluidextract The pH of Eschenbrenner's infusion was 4.5 Madsen (216) claimed that such an infusion was unstable and proposed a formula which produces an alcoholic infusion of pH 3.6 This was claimed to be stable for three years

Conduche and Gregoire (148) have reported that in aromatic waters, both filtered and unfiltered, there was a diminution of acidity on keeping The pH usually changed from about 3.8-7.0 The reduction of acidity was almost proportional to the amount of volatile oils which separated and was evidently a result of the removal of the volatile oils The reaction could best be stabilized by preventing the growth of microorganisms Krantz and Carr (164) have investigated the effects of different filtering mediums upon the reaction of Aromatic Elixir Using talc, as in the U S P preparation, the pH values were between 7.00-7.35 Elixirs prepared with magnesium carbonate had pH values from 9.10-9.80, with magnesite or normal magnesium carbonate the pH was 6.8, and with precipitated calcium phosphate the pH was between 5.95-6.30

Miscellaneous Chemical Preparations—Husa and Klotz (314), (315) have studied the mode of decomposition of Syrup of Ferrous Iodide During storage the pH always dropped from 4.1 or above to 3.2 The hydrolysis predominated according to the equation

Two equilibria existed in the hydrolysis one at pH 4.1 and the other at pH 3.2 Precipitation occurred at pH 3.2 Alkaline glass of the container retarded the hydrolysis It was shown by solubility product data that precipitation of Fe(OH)_2 cannot occur in the syrup Ewe (200) reported that Syrup of Hydriodic Acid caramelized, due to excessive acidity Attempts to lower the acidity by reducing the proportion of hypophosphorous acid resulted in the appearance of free iodine in the syrup When the acidity was reduced by diluting the syrup with water until the sugar content was 35%, the syrup remained colorless for a year Husa and Magid (271) also reported that the decomposition of the Syrup of Hydriodic Acid increased with increasing hydrogen ion concentration Mercuric iodide, barium iodide, aluminum sulphate and calcium chloride caused a marked retardation of the decomposition of the syrup

Guyote (74) reported that a solution of arsenous iodide hydrolyzes to hydriodic acid which becomes oxidized to free iodine This was overcome by neutralizing the solution with sodium

hydroxide, thus converting the arsenous iodide to an arsenite. The arsenite solution appeared to be stable. Knight (112) criticized the U S P Fowler's Solution, claiming that 2% of potassium bicarbonate causes an unnecessary increase in alkalinity. He stated that 1% of potassium bicarbonate would be sufficient. Smelt (293) recommended that the B P Fowler's Solution be adjusted to a p_H less than 4.0. The growth of molds was favored between p_H 5.0-7.8, and precipitation occurred between p_H 4-9. The acid solution was favored because of greater compatibility.

Donovan's Solution can be sufficiently stabilized by adjusting the p_H to neutrality. The U S P preparation is very acid, due to the hydrolysis of the arsenous iodide. Cocking (122) and Husa (160) both showed that the hydrolysis of dilute arsenous iodide is complete, the p_H of tenth normal solutions of arsenous iodide and hydriodic acid being the same, 1.1. Duncan (14) first showed that the liberation of iodine from Donovan's Solution could be checked by neutralizing the free hydriodic acid. Husa (158), (241), (270) found that the p_H of Donovan's Solution was 1.2. There was no liberation of iodine when the p_H was adjusted to 6.0-8.0. He recommended the use of a carbonate as the neutralizing agent as it prevented oxidation by replacing the air with carbon dioxide.

Husa (272) stated that the stability of Solution of Iron and Ammonium Acetate was slightly increased when the acetic acid was omitted and the solution buffered with hydrochloric acid. Ammonium chloride and sodium chloride. Jones and Glass (161) reported that properly prepared Iron and Ammonium Citrate is a neutral substance of p_H of about 7.5. Its incompatibility with magnesium sulphate could not be correlated with any increase of p_H . Morton (168) stated that the commercial bismuth and ammonium citrate and the B P Solution of Bismuth and Ammonium Citrate are unsatisfactory preparations. The complex was stable only in the presence of an excess of alkali citrate. Kleinschmidt (212) claimed that the Solution of Magnesium Citrate would not precipitate if the citric acid content were reduced. Oakley and Krantz (246), however, decided that the precipitation was due to the conversion of a large amount of the magnesium acid citrate to the neutral salt, $Mg(C_6H_5O_7)_2$, and that the presence of an excess of citric acid would shift the equilibrium to the acid salt and favor stability.

Ëwe (200) reported that the fungous growths in the Acid Solution of Phosphates could be prevented by the addition of about 1% of concentrated hydrochloric acid and 0.4% formic acid. Ëwe further stated that the Compound Elixir of Glycerophosphates develops a precipitate within a few months. The precipitation was reduced by increasing the lactic acid content, and was completely corrected by substituting phosphoric acid instead.

DeKay and Lee (262) found that samples of the official Elixir of Ferric Pyrophosphate, Quinine and Strychnine underwent a color change which was roughly proportional to a simultaneous increase in p_H . Those samples which were carefully neutralized in their preparation were most constant in p_H but the neutralization did not affect their stability.

Thompson and his co-workers (296) reported that the p_H values of Spirit of Ethyl Nitrite changed greatly during deterioration. The following are the p_H values of different samples corresponding to the ethyl nitrite content during 23 months' storage:

4.25% (fresh)	2.95%	1.54%	0.00%	0.00%
p_H 0.82	p_H 0.46	p_H 1.00	p_H 5.95	p_H 4.34

Davis (197), (198) reported the p_H of various hypochlorite preparations as follows: Dakin's Solution, p_H 9.71, Eusol, p_H 7.21, Daufresne's Solution, p_H 10.23, 1% Chloramine, p_H 10.05. Eusol decomposed more rapidly than the more alkaline Dakin's Solution. When Davis prepared mixtures of chlorinated lime, sodium carbonate and boric acid, p_H 9.53 was the lowest p_H value which could be obtained with stable preparations.

Noyes and Wilson (52) obtained evidence that hypochlorous acid ionizes in an amphoteric fashion, forming both positive and negative chlorine ions. They assumed the presence of two compounds, $H^+ ClO^-$ and $Cl^+ OH^-$. Lynch and Nodder (245) have published the most extensive data concerning the ionic condition of hypochlorite solutions. They included a method for calculating the displacement of the p_H of buffer solutions, due to the presence of sodium hypochlorite. The development of the glass electrode enabled Davidson (261) to accurately determine the dissociation constant of hypochlorous acid as 3.7×10^{-8} at 20° C. He reported that bleaching powder decomposed, forming oxalic and carbonic acids with an accompanying reduction of p_H . The more alkaline solutions decomposed the least, and decomposition was much less when the acids were removed as they were formed.

pH AND STABILITY OF ALKALOIDS

It has been shown that *pH* is an important factor in the stability of alkaloids during sterilization. It is obvious, also, that the *pH* of these solutions for injection must be stabilized to a value comparable to the *pH* of the blood. Trendelenburg (70), Schon (225), Regnier (285), (328), Schou (291), and Woelm (299) have pointed out the importance of buffering to the physiological *pH* solutions of morphine, cocaine, tutocaine and larocaine solutions which are intended for injection. This buffering is necessary not only to counteract the alkaline tendency of the glass containers but to prevent a spontaneous change in hydrogen ion concentration as a result of the decomposition of a small amount of the alkaloid.

Dietzel and Huss (111) studied the decomposition of morphine at high temperatures and at different *pH* values. The decomposition was detected by changes in the absorption spectrum. At *pH* values of less than 5.5, the morphine was stable for 60 minutes at 100° C. Neutral and alkaline solutions were very unstable. The free morphine was not any less stable than the morphine hydrochloride, the decomposition being due to oxidation by hydroxyl ion catalysis. It was found that alkaline glass caused decomposition at room temperature. Dietzel (311) verified his results in 1934 and again attributed the stability at reduced *pH* to catalytic neutrality. The *pH* of morphine hydrochloride and morphine sulphate solutions is about 4.0.

Cocaine also requires an acid medium for stability and undergoes a decrease in *pH* during storage and sterilization. Regnier and his co-workers (285) (286) demonstrated the change to acidity during storage and pointed out the dangers of the pharmacological use of such acid solutions. Macht and Anderson (98) and Macht and Krantz (99) reported that exposure to polarized light increased the hydrogen ion concentration of cocaine solutions. Dietzel and Steeger (263) reported that the hydrolysis of cocaine by heat was a minimum between *pH* 2-5. The type of glass container had a negligible effect. Schon and Helm (225) reported that the hydrolysis of benzoyl ecgonine was a minimum between *pH* 2-7. When they attempted to buffer cocaine solutions to the physiological *pH*, hydrolysis was accelerated unless the *pH* was as low as 3.4. A pure solution of cocaine hydrochloride changed in 2 months from *pH* 5.17 to 4.2 without any perceptible decomposition. One buffered to *pH* 6.05 showed 31% hydrolysis in the same time. Regnier and David (287) found that solutions buffered to neutrality by being saturated with calcium carbonate and magnesium carbonate retained their potency during sterilization but rapidly deteriorated afterward. Their anesthetic power was inferior to that of pure solutions of cocaine. Regnier and David (327), (328) later reported that solutions of cocaine buffered by NaH_2PO_4 almost completely deteriorated during sterilization but those buffered by acetic acid and sodium citrate retained their activity. Dietzel (311) reported that of the various cocaine salts, cocaine sulphate was most stable during the first 25 hours of heating. The *pH* of cocaine sulphate solutions is about 5.2.

Dietzel and Steeger (263) determined the dissociation constants for cocaine and its hydrolysis products. The results were as follows:

Cocaine	2.4×10^{-6}	
Methylecgonine	3.0×10^{-6}	
Benzoylecgonine	$\frac{(\text{benzoylecgonine}) (\text{OH}^-)}{(\text{benzoylecgonine})}$	1.9×10^{-12}
	$\frac{(\text{benzoylecgonine}) (\text{H}^+)}{(\text{benzoylecgonine})}$	1.8×10^{-18}
Ecgonine	$\frac{(\text{ecgonine}) (\text{OH}^-)}{(\text{ecgonine})}$	6.0×10^{-12}
	$\frac{(\text{ecgonine}) (\text{H}^+)}{(\text{ecgonine})}$	7.6×10^{-12}

The authors pointed out that in the choice of an acid to be combined with cocaine its dissociation constant must not be smaller than that of methylecgonine or cocaine, that is, not smaller than 10^{-6} . Otherwise the dissociation forms hydroxyl ions which promote hydrolysis by hydroxyl ion catalysis.

Abildgaard (190) reported that solutions of procaine hydrochloride in hydrochloric acid showed no appreciable decomposition when heated. Under the same conditions and in a pure water solution, 5% of the procaine hydrochloride was hydrolyzed, and, when buffered to a p_H of 6.5, 19-35% was hydrolyzed. Wiedhopf (231) claimed that pantokain is very stable and can withstand several hours' boiling near the neutral point. An aqueous solution has a p_H of 7.0 and a 1% solution in physiological salt solution has a p_H of 6.7. Procaine was more easily hydrolyzed. Schou and Staggenmeier (291) reported that turocaine, when heated to 120° C for 20 minutes, decomposed 24% at p_H 7.0 and 12.2% at p_H 6.5. Under the same conditions tarcaine decomposed 20.9% at p_H 7.0 and 11.4% at p_H 6.5. The solutions were adjusted with phosphate buffers. Dietzel and Kuhl (310) reported that during storage of eucaine hydrochloride the p_H dropped from 6.98 to 5.26 in 1 year with 39.7% decomposition. Heat sterilization or exposure to oxygen did not hasten the decomposition.

Schou and Bjerregaard (249) have studied the decomposition of atropine and homatropine solutions. Pure 0.4% aqueous atropine sulphate was sterilized for 20 minutes at 120° C with only 3.4% hydrolysis. Buffering to higher p_H values caused greater loss. Pure 0.4% aqueous homatropine hydrobromide was less stable and decomposed 8.2% under the same conditions. Complete hydrolysis occurred at p_H 7.3 and above.

Biddle and Watson (28) noted that changes in the hydrogen ion concentration caused a change in the ionic condition of the cinchona alkaloids. Dietzel and Sollner (149) have elaborated on this work. They stated that in the water-soluble salts of quinine, quinidine and cinchonidine, the nitrogen of the quinuchidine ring is ionized while the nitrogen of the quinoline ring is not. In the presence of an excess of acid, the latter nitrogen ionizes and forms salts. With decreasing p_H there was in each case an increase of optical rotation which paralleled the ionization of the quinoline nitrogen. Macht and Anderson (99) reported that quinine and cinchonidine salts decreased in toxicity upon exposure to polarized light.

Dietzel (311) reported that hydrastine decomposed very rapidly at 100° C but that hydrastinine showed very little change. Decomposition of berberine was very slight and evidently was not altered by an increase in hydrogen-ion concentration.

Gifford and Smith (265) reported that physostigmine and pilocarpine decomposed more rapidly in an alkaline buffer solution of p_H 7.6 than in an acid buffer solution of p_H 5.5.

p_H AND STABILITY OF MISCELLANEOUS ORGANIC COMPOUNDS

Nielson (284) reported that the decomposition of sodium luminal increased with increasing p_H . A 10% solution has a p_H of about 8.9. A 10% solution decomposed 1.0% in 3 weeks at room temperature and 22% in 1 month at 39° C. Madsen (319) reported that the decomposition of sodium barbital also increased with increasing p_H . A 10% solution has a p_H of 8.9. The decomposition was accompanied by a decrease in p_H . Sixty minutes at 100° C caused 2.5% decomposition of the sodium barbital with the formation of diethylacetylurea.

Kolthoff (128) claimed that the decomposition of a thiosulphate with acid was due to the formation of the undissociated thiosulphuric acid which is unstable. Schou and Bennekou (290) stated that sodium thiosulphate solutions could be sterilized without decomposition only when the p_H was 7.0. The solutions were adjusted by phosphate buffers.

Macht and Shohl (37) have published data concerning the decomposition of benzyl alcohol solutions. Solutions stored in insoluble glass were stable over long periods of time but showed a slight increase in hydrogen ion concentration. Solutions stored in soft or alkaline glass quickly became alkaline and rapidly deteriorated. The deterioration was evidently an oxidation process. The authors claimed that the oxidation was hastened by neutralizing the benzoic acid which was formed. It was recommended that solutions of benzyl alcohol be sealed in hard glass containers with the addition of a buffer to keep the p_H between 6.8-7.0.

Nijhoff and Van Oort (171) found that urotropin solutions could not be sterilized by boiling because of decomposition into ammonia and formic acid. The type of glass did not influence the decomposition. The authors recommended that urotropin be sterilized by tyndalization after the addition of 2% of sodium bicarbonate.

Levy and Cullen (36) found that the autoclaving of strophanthin solutions changed the reaction from p_H 6.0 to p_H 9.0. This increase in p_H greatly reduced the biological action of strophanthin. Autoclaving at p_H 5.0 caused only 2% deterioration. Haag and Hatcher (127) have

also demonstrated the alkaline instability of strophanthin. They reported that ouabain solutions slowly decomposed in ampuls of hard glass.

Dubrisay and Emschwiller (237) have completed a thorough study of the decomposition of iodoform. Iodoform in solution was oxidized by light with the formation of iodine and hydriodic acid, which, in turn, accelerated further oxidation. Other mineral acids promoted oxidation, whether in the light or dark. Oxidation was the slowest with ether, carbon disulphide or toluene as the solvent. Very small amounts of phenol or hydroquinone retarded the oxidation.

Lindholm (276) reported that hydrogen peroxide solutions were stabilized by the addition of any one of the following: acetanilid, quinine hydrochloride, urea, methyl parahydroxybenzoate, acetphenetidin, oxalic acid and iodine. A 3% peroxide solution was stabilized by 0.04% iodine for 5 years.

Pertaining to the stabilization of phenol, Vergez (252) stated that a solution containing 20 Gm of phenol, 8 Gm of crystalline boric acid and 1000 cc of water remained unchanged for 18 months.

In 1929, Smith and his co-workers (136) reported the finding of large discrepancies in the pH values of commercial neoparsphenamine. The values ranged from pH 5.80-8.74. Upon dilution, some samples increased in pH and others decreased.

GENERAL PRINCIPLES CONCERNING pH AND STABILITY

Much work has been performed which, at the present time, has little practical application in the stabilizing of drugs. However, the results of these investigations have established certain fundamental principles which can broaden our conception concerning the mechanism of the ionic condition.

For instance, Kolthoff (128) has shown conclusively that ions which are in an adsorbed state possess reaction qualities different from those of free ions. If the ions of the reacting substance are adsorbed upon some stratum, the reaction is greatly retarded and, if the ions of a product of a reaction are adsorbed, the reaction is greatly accelerated. In his experiments the ions were adsorbed upon charcoal.

Kiehl and Hansen (84) have investigated the ionization during the hydration of pyrophosphates. By the use of reference curves obtained by making hydrogen ion concentration measurements on synthetic solutions and plotting the molar concentrations of hydrogen ions against the molar concentrations of disodium orthophosphate, each hydration was followed to completion by hydrogen-ion concentration measurements. The hydrogen ion concentration decreased progressively with time, reaching a final fixed value as complete conversion to the orthophosphate occurred. This fact indicates that pyrophosphoric acid produces more hydrogen ions than does orthophosphoric acid and, consequently, that the withdrawal of hydrogen ions will displace the reaction toward the pyro acid.

Buchanan and Barsky (144) reported that the rate of polymerization of cyanamide is a function of the hydrogen ion concentration, the velocity of the reaction being greatest at pH 9.6 and decreasing rapidly above and below this point. Between pH 6-10 the polymer alone (param or cyanoguanidine) was formed. Between pH 10-12 both the polymer and urea were formed. Above pH 12 no polymerization occurred and only urea was formed. Zappi and Williams (255) noted also that there was an optimum pH in the region of 9.5 for the polymerization of aldehydes. Zappi's article was also of interest concerning the effect of pH upon the concentrations of the tautomeric forms of aldehydes.

Volfkovich (253) and Bryan (258), (259) have demonstrated the presence of a transition point at pH 4.3 between the two types of oxidation, addition of oxygen and hydrogen evolution. The hydrogen evolution occurred below pH 4.3. This was applied experimentally to iron salts and to sulphites.

Bolin (107) has determined a number of pH values for the maximum stability against hydrolysis of esters. The reactions occurred at 25° C unless stated otherwise. His results indicate that esters are hydrolyzed by hydrogen- and hydroxyl ion catalysis. He drew the following conclusions: For esters of fatty acids, the optimum pH for a weak acid is lower than for a strong acid. For methyl esters, the optimum pH is lower than for the corresponding ethyl esters. Introduction of a phenyl group lowers the optimum pH and increases the ve-

locity of decomposition Bolin claimed that derivatives of secondary amines and similar compounds which are not prone to hydrolysis are most stable at pH 7.0

	pH		pH
Ethyl butyrate	5.65	Ethyl phenylacetate	4.9
Methyl benzoate	4.0 (80° C)	Ethyl acetoacetate	4.4
Ethyl benzoate	4.15 (80° C)	Ethyl alphachloropropionate	4.0
Phenyl acetate	4.1	Ethyl hippurate	4.4
Benzyl acetate	4.3	Methyl acetanilide	6.0

Olivier (134) claimed that the influence of the hydrogen-ion concentration upon hydrolysis is conditioned by the nature of the organic compound. Such an influence is absent in alkyl halides and acid chlorides, as well as in other compounds in which the water molecule, as such, may be expected to add directly. Olivier further stated that the concordant and regular influence of the substituents upon the hydrogen ion catalyzed hydrolysis of esters are best explained by the theories of induced alternating polarities of Lapworth, Kermak and Robinson. For further information concerning the reaction of different molecular structures to hydrogen ion catalysis the reader is referred to Olivier (321), (322), (323).

ASTRINGENT MOUTH WASH

(Zinc Chloride Type)

Zinc Chloride	2 0 Gm
Menthol	0 6 Gm
Oil of Cinnamon	1 4 cc
Oil of Clove	0 3 cc
Formaldehyde	0 4 cc
Saccharin	0 4 Gm
Alcohol	40 0 cc

Water q s ad 1000 0 cc

A mouth wash preferred by some who desire the astringent effect of a zinc salt

MOUTH RINSE No 1

Saccharin Soluble	0 10 Gm
Fuchsin, basic	0 02 Gm
Oil of Cinnamon	0 25 cc
Oil of Peppermint	0 25 cc
Oil of Clove	0 50 cc

Alcohol	300 00 cc
Talc	10 00 Gm

Distilled Water, q s 1000 00 cc

This makes a pleasant sweet spicy mouth rinse when diluted with 2-3 parts of water. No medication is intended in this formula. Especially suitable for the Spray Bottle

MOUTH RINSE No 2

Thymol	0 50 Gm
Menthol	1 00 Gm
Oil of Peppermint	3 00 cc
Alcohol	300 00 cc

Distilled Water, q s, 1000 00 cc
Color to suit

A pleasant mint-flavored mouth wash to be used diluted 2-3 times with water. Especially suitable for the Spray Bottle

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1934-1935

March 28 1935

Office of the Secretary, 2215 Constitution Avenue, Washington, D C

LETTER NO 15

To the Members of the Council

78 *Committee on National Formulary* Recently Mr Oliver A Farwell submitted his resignation as a member of the A P H A and as a member of the Committee on N F because of his retirement from active work

The By Laws provide that "Whenever deemed advisable by the Council, it shall after the publication of each edition of the National Formulary, appoint a committee of 15 members from the general membership of the ASSOCIATION, which committee shall have charge of the revision of the Formulary This committee shall report annually, or as often as required, to the Council, and shall continue to serve for a term of ten years or until their successors are appointed Vacancies occurring in this committee shall be filled by the Council as quickly as is expedient "

The resignation was reported to Chairman Gathercoal of the Committee, and the following letter has been received from him

"As you informed me that Dr Oliver A Farwell has resigned from the National Formulary Committee and as the work of this Committee should actively continue during the years immediately ahead, I would offer the suggestion that one of the capable pharmacognosists of the United States be elected to the Committee to take the place occupied by Dr Farwell

"There are several very splendid and experienced men in the group of younger pharmacognosists who have been somewhat active as auxiliary members in the work of the present revision Among these, Dr E H Wirth has taken an unusually active part and has been of great assistance to me It gives me pleasure to recommend him as a nominee for this vacant place on the N F Committee "

If members of the Council desire to submit other nominees for the vacancy, they are requested to do so promptly

79 *Honorarium for Editor of the Recipe Book I* At a recent meeting of the Executive Committee of the Council and in connection with a vote to make an appropriation for the editing of the copy for Recipe Book II, Dr LaWall called attention to the fact that Professor Ivor Griffith had not been paid anything for his work as editor of the Recipe Book I \$1000 00 was appropriated for the editing of the Recipe Book I and this amount plus an added appropriation was expended for clerical and other assistance in the work

The following letter was received from Dr LaWall

"I wish to make a motion that inasmuch as Professor Ivor Griffith never received any remuneration for the long and arduous work of editing the manuscript for the first edition of the Recipe Book that he be paid an honorarium of \$500 for this service "

and the following letter from Dr James H Beal

"Returning from a trip North, I find your letter of inquiry regarding the proposed honorarium to Dr Ivor Griffith awaiting attention

"I recall that the matter was discussed in Council on several occasions and that there was a general understanding that the payments made to Dr Griffith were

solely on account of the clerical services which he was obliged to procure. It was my understanding, also, that an honorarium would be tendered to him for his own valuable services as Editor of the manuscript of the text of the Recipe Book at some future date. I do not recall that any formal motion to that effect was adopted, but the sum of \$500.00 was named in the discussion, and it was also suggested that the honorarium be paid after the Recipe Book had been issued and placed on sale.

"I feel sure that Dr. Griffith abundantly deserves such recognition, and would be glad to second a motion awarding him the honorarium of \$500.00."

(Motion No. 29) It is moved by LaWall that Professor Ivor Griffith be paid an honorarium of \$500.00 for his services as Editor of the Pharmaceutical Recipe Book, First Edition, and that this sum be added to the appropriation for the Recipe Book in the Budget for 1935.

A vote on this motion will be called for in about two weeks.

80 Life Members E. Fullerton Cook, Philadelphia, Pa., Charles Morgan, Baltimore Md., and Leonard A. Seltzer, Detroit Mich., have become Life Members through the payment of dues for thirty-seven years, and Edwin R. Westmorland, Lockhart, Texas, through membership since 1910 and the payment of \$25.00.

81 Applicants for Membership The following applications properly endorsed and accompanied by the first year's dues have been received:

(Motion No 30) *Vote on applications for membership in the American Pharmaceutical Association* E F KELLY Secretary

LETTER NO 16

May 7, 1935

To the Members of the Council

82 *Year Books for the Library of Congress* Motion No 26 (Council Letter Nos 12, page 167, and 14 page 426) has been carried

83 *Minutes of the Meeting of the Executive Committee* Motion No 27 (Council Letter No 13, page 329) has been carried President Fischelis voted "No" for the reason given in his letter of April 3, 1935, of which copies were sent to members of the Council

84 *Sale and Exchange of Liberty Bonds* Motion No 28 (Council Letter No 14, page 428) has been carried President Fischelis voted "No" for the reason given in his letter of April 3 1935, of which copies were sent to the members of the Council The Fourth Liberty Loan Bonds referred to were delivered for exchange and sale The U S Treasury Bonds, 27/8%, 1955-1960 have not, as yet been delivered and a report will be submitted promptly upon their receipt

85 *Committee on National Formulary* See Council Letter No 15, page 509 President Fischelis has submitted the following

'I would like to nominate Professor Arno Viehoever of Philadelphia, for membership on the National Formulary Committee, to succeed Dr Farwell As you well know, Dr Viehoever is an outstanding pharmacognosist and would, no doubt, serve in a capable manner'

(Motion No 31) *As no other nominations have been received than those of Dr E H Wirth and Prof Arno Viehoever, the members of the Council are requested to vote on these two nominees*

86 *Honorarium for Editor of Recipe Book I* See Council Letter No 15, page 509 Dr H V Army submitted the following letter

'Commenting on Motion No 29 (Council Letter No 15), I beg leave to make the following comments (1) In 1924 an appropriation of \$1000 00 was made to Dr

Griffith to edit the manuscript of Recipe Book No 1 as he received it from Chairman Lascoff and to carry the work through the press to its ultimate publication (2) I learn that during 1925-1929 Dr Griffith received \$1375 66 for this purpose (3) I, therefore, cannot see why another \$500 00 appropriation be granted to Dr Griffith especially since Chairman Lascoff has neither received nor asked for an honorarium for his fine work in behalf of the Recipe Book "

President Fischelis requested certain information with respect to the payment of honoraria, in his letter of April 3, 1935, of which copies were sent to the members of the Council Copies of the secretary's reply of April 5, 1935, were also sent to members of the Council

A vote on Motion No 29 is called for at this time

87 *Election of Members* Motion No 30 (Council Letter No 15 page 511) has been carried and applicants for membership numbered 110 to 200 are declared elected

88 *Committee on Library and Committee on Museum* The members of the Council are requested to submit nominations for the members of these two special committees (Council Letter No 13, page 331) Please note that the membership of these committees is not limited to Council members and is to be selected with special reference to their knowledge and experience

89 *Program of the 1935 Meeting* The tentative general program is being completed and will be submitted to the Council in an early letter

90 *Applicants for Membership* The following applications properly endorsed and accompanied by the first year's dues have been received

No 201, Carle Muzzy Bigelow, c/o the Calco Chemical Co, Bound Brook, N J No 202 F W Moudry, 5th & St Peter Sts, St Paul, Minn, No 203, Jennie Morrow Banning, St Joseph Mercy Hospital, Sioux City, Iowa, No 204, Michael F Hastings, 106 High St, Clinton Mass, No 205, Bernard Schneider, 1564 St Paul St, Rochester, N Y, No 206, William R Bond, 21 Grey Oaks Ave, Nepera Park, N Y, No 207, Harry A Nuse, 155 Leonard St, New York, N Y, No 208, W O Frohring, 4614 Prospect Ave, Cleveland Ohio, No 209, Evelyn Gray Scott, 11809 Cromwell Ave, Cleveland Ohio, No 210, Morgen Reno Hohmann, 6721 Bartmer Ave, St Louis, Mo, No 211, Albert H Musick, 624 W 49th St Los Angeles, Calif, No 212, Abraham Lynn Dubinbaum, 1501 Undercliff Ave, Bronx, New York City, No 213, Joseph Ludwig Stummer, 23 E 20th St, New York N Y, No 214, Hyman Ferber, 1483 Bryant Ave, New York, N Y, No 215, Eugene Renaud, Fort & State Sts, Lincoln Park Mich, No 216, Lucille Dahlquist, College of Pharmacy, San Francisco, Calif, No 217, Frederick P McNess, 620 N Lake St, Madison, Wis, No 218, Sister M Marcina, 390 E Division St, Fond du Lac, Wis

(Motion No 32) *Vote on applications for membership in the American Pharmaceutical Association*

E F KELLY, Secretary

LETTER NO 17

May 27, 1935

To the Members of the Council

91 *Committee on National Formulary* Dr E H Wirth has been elected as a member of this Committee to serve the unexpired term of Oliver A Farwell

92 *Honorarium for Editor of Recipe Book I* The vote on Motion No 29 (Council Letters No 15, page 509, and No 16 page 511) is not complete and the announcement will, therefore, be deferred

93 *Election of Members* Motion No 32 (Council Letter No 16, page 512) has been carried and applicants numbered 201 to 218, inclusive, are declared elected

94 *Committee on Library and Committee on Museum* Those members of the Council who have not submitted nominations for members of these two special committees (Council Letter 13, page 331, Council Letter No 16, page 512) are requested to do so promptly

95 *Use of the Text of the N F VI* The following communication has been received through Chairman Gathercoal from Paul Nicholas Leech Secretary Council on Pharmacy and Chemistry of the American Medical Association

"The Council on Pharmacy and Chemistry is about to revise its publications dealing with National Formulary products so as to bring them into conformance with the new National Formulary. It is hoped that the revisions of these books can start about June 1st. The Council has therefore directed the secretary to communicate with you and to ask for permission to quote from the National Formulary in the forthcoming editions of the following books: 'Useful Drugs,' 'Hospital Practice for Interns,' 'Epitome of the U. S. Pharmacopœia' and National Formulary."

In order that you may know the general scope of these books a complimentary copy of each is being sent to you. It is understood, of course, that if permission is granted there will be published on the back of the title page the announcement of the permission of your Committee, such as now appears in the books being sent to you. If this statement requires any modification the Council shall be pleased to make it in accordance with the desires of the National Formulary Committee."

The request was referred to Chairman DuMez of the Committee on Publications who writes as follows:

"Inasmuch as the privilege to use portions of the text of the National Formulary for comment has been given to the American Medical Association in the past, and that Association has not abused the privilege, to the best of my knowledge, I can see no good reason why this privilege should not be extended as heretofore."

(Motion No. 33) It is moved by DuMez that the American Medical Association be granted permission to use for partial reproduction the text of the N. F. V in its publications entitled "Useful Drugs," "Hospital Practice for Interns," and "Epitome of the U. S. Pharmacopœia and National Formulary" with the understanding that the usual notice will appear on the back of the title page of each of the publications and that these publications will not be issued until after the N. F. VI has been issued and that no charge be made. A vote on this motion will be called for in about ten days.

96 *Tentative General Program for the Eighty Third Meeting.* With the approval of President Fischel, Local Secretary Mickelsen and the Committee on Standard Program of the Council, the secretary submits the attached tentative general program. Officials of the various affiliated organizations represented in the program have approved those features in which their respective organizations are directly interested.

The important changes suggested in the tentative program for the 1935 meeting are:

(a) The meeting of the Council heretofore held on Monday has been scheduled for the Saturday preceding. The object is to avoid the conflict with the sessions of the A. A. C. P. and the N. A. B. P. on Monday and to provide time for the uninterrupted consideration of the important business to come before the Council. It is understood that the meeting of the Council will be continued on Sunday if necessary.

(b) Provision is made for a Joint Meeting of the Council and the Executive Committee of the N. A. R. D. on Wednesday afternoon, August 7th.

(c) Meetings of the Committees on Nominations and on Resolutions are scheduled in order that those who may desire to appear before these Committees will have the opportunity to do so.

(d) The Third Session of the House of Delegates is scheduled for Friday afternoon rather than on Friday morning and the short Final Session of the House heretofore held just prior to the Final General Session on Friday evening is omitted, since the change above mentioned makes the short session unnecessary. Under the proposed arrangement, the sessions of the Sections will be completed by noon on Friday and all resolutions and actions requiring consideration by the House of Delegates can be acted upon at the Friday afternoon session. In addition, time will be available to prepare the final report of the House for consideration at the Final General Session.

In this connection, the following letter has been received from Chairman Hilton:

"I approve the Tentative Program for the Portland Meeting with the exception of the meeting of the Council on Saturday, August 3rd.

"It is my belief that this meeting of the Council should be scheduled for Sunday, August 4th, at 10 A. M. because it will be difficult to secure the attendance of

a quorum on Saturday and because the business to come before the Council can certainly be completed during a morning, afternoon and evening session on Sunday I understand that Dean Bradley has expressed the same opinion

Please place this statement before the Council in submitting the Tentative Program and I suggest that, when a vote is called for, you request an opinion from the members of the Council "

(*Motion No 34*) *It is moved by Kelly that the tentative general program of the Eighty Third Annual Meeting be approved* A vote on this motion will be called for in about ten days

E F KELLY, *Secretary*

TENTATIVE GENERAL PROGRAM FOR THE EIGHTY THIRD ANNUAL MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION AND RELATED ORGANIZATIONS, HOTEL MULTNOMAH, PORTLAND, OREGON, AUGUST 1-10, 1935

All dates included in special fare arrangements with railroads

AUGUST 1-3		6 00 P M	Dinner, A A C P—Marine Room

SATURDAY, AUGUST 10

- 9 30 A M An all-day scenic drive up the Columbia River Highway including a visit to the Bonneville Dam and an out-door luncheon featuring Columbia River salmon

PARTIAL LIST OF PAPERS OF THE SECTIONS, CONFERENCES, ETC

Officers who have not reported will please mail programs as far as they have been completed by *Special Delivery*, to the Editor of the JOURNAL A Ph A, 2215 Constitution Ave., Washington, D C. *This request is made, because it is necessary for the preparation of the program.*

Contributors should at once send in their papers to Section and Conference Officers. See list of Officers under Societies and Colleges in this issue of the JOURNAL.

SCIENTIFIC SECTION

Members and Friends of the Scientific Section, American Pharmaceutical Association

The 83rd annual meeting will be held in Portland, Oregon, during the week of August 5th.

The Scientific Section will hold several sessions and for the officers to plan these sessions, we should know as early as possible not only the titles of the papers to be presented but

also have short abstracts of them With this information the program can be arranged so as to group the papers on a common subject

It is now only about four weeks before the convention, and authors of papers should advise the secretary promptly, giving titles of the papers which they will present, and also note if they expect to be present in person or if the paper is to be presented by title

The By-Laws provide that papers shall be presented in duplicate, so that one copy will be available for publication and the other can be referred to the Committee on Ebert Prize In writing the paper, the authors should follow the procedure as outlined in the March JOURNAL, page 256 (Also on the page facing the Abstract Section of each issue of the JOURNAL) When submitting your title, also inform the secretary whether a lantern will be required for the presentation

FRANCIS E BIBBENS, *Secretary*

PARTIAL LIST OF PAPERS FOR SCIENTIFIC SECTION, A PH A

"A Study of Lacinaria Species," B V Christensen and G M Hocking

"The Assay of Organic Medicinal Preparations Containing Arsenic," Edward J Hughes

"Modern Pharmaceutical Research Problems," Henry J Goeckel

"Absorption of Drugs by the Human Skin," A Richard Bliss, Jr

"The Microscopy of Powdered Desiccated Thyroid and Suprarenal Glands," Heber W Youngken

"Antiseptics A Comparative Study of Laboratory and Practical Tests," George F Reddish

PARTIAL LIST OF PAPERS FOR SECTION ON PRACTICAL PHARMACY AND DISPENSING

"Improvement in Technique in the Preparation of Three Common Products," Edward D Davy

"Professional Pharmacy," Ernest T Stuhr

"Potent Medicaments in Sugar-Coated Pills and in Confections," John F Suchy

"Difficult Prescriptions, Series No 4," J Leon Lascoff

"Enteric Pill Coatings," F S Bukey

"The Hospital and the Pharmacist, Some Observations in Establishing a Department of Pharmacy in a Hospital," H C McAllister

"Studies on Three U S P and N F

Preparations by Shortened Procedures," Henry M Burlage and W J Smith

The following have promised papers to the Section Carl Gibson, C George Hamilton, George Secord, R P LeRoy Thomas G Wright, William F Reindollar J Solon Mordell P W Howard, R L Swain, L M Kantner Marvin J Andrews

PARTIAL LIST OF PAPERS FOR SECTION ON COMMERCIAL INTERESTS

"The Pharmacist Studies Law," Charles G Ajax

"How to Help the Pharmacist Commercially," Eugene C Brokmeyer

"A Study of the Commercial Pharmacy Curriculum," Neal Bowman

"What Determines Net Profit? C Leonard O'Connell

"The Fair Trade Acts and Their Effects" Paul C Olsen

"The Selling Price of Prescriptions," Frank A Delgado

"The Open View Prescription Department" Frank A Delgado

"Merchandising Your Profession" Ralph A Beegle

"The Need of Commercial Training in Colleges of Pharmacy," Ralph A Beegle

"Dogs, Cats, Birds and Babies," Alice-Esther Garvin

"The Futility of Cutting Prices and a Comparative Price Survey of Two States—One with a Price Maintenance Act," George F Archambault

"The California Fair Trade Act" Ira J Darling

"Vaccines and Serum Products of U S P XI" Clarence M Brown

PARTIAL LIST OF PAPERS FOR SECTION ON HISTORICAL PHARMACY

"A Brief History of the Drug Code," E F Kelly

"The First Pharmacist in North America" T J Bradley

"Medicine Making as Depicted by Museum Dioramas" Charles Whitebread

"Honoring Age and Service," John E Kramer

"The Origin and Development of Pharmaceutical Education in the United States," Ernest T Stuhr

"Report of the Pharmacy Exhibit at the World's Fair during 1933 and 1934," H C Christensen

'History of the Darflinger Druggist's Show Globes," Robert W Rodman

"David Henshaw, the Druggist's Secretary of the Navy," George E Éwe

"The Pharmaceutical Museum at the University of Minnesota," Frederick J Wulling

"Drugs of the Bible," A R Bliss, Jr

"The Ancient Medicinal Uses of Gems and Precious Stones," A R Bliss, Jr

"William Withering and the Introduction of Digitalis into Medical Practice" Louis H Roddis

'Estoman Pharmacy " Rudolf Wallner

Thirty-Second Annual Meeting of the

NATIONAL ASSOCIATION OF BOARDS OF PHARMACY

HOTEL MULTNOMAH, PORTLAND, OREGON,
AUGUST 5-6, 1935

OFFICERS

President, C H Evans, *Honorary President*, F W Hancock, *Vice Presidents*, George Moulton, John Woodside, E V Zoeller, Albert Ely, Wm Muesing, C M Brewer, R C Shultz, R W Fleming, *Secretary*, H C Christensen, *Treasurer*, J W Gayle

Program

MONDAY, AUGUST 5, AT 9 30 A M—FIRST SESSION—ASSEMBLY HALL ROOM

- 1 Call to Order, President C H Evans
- 2 Roll Call
- 3 Appointment of Committee on Credentials, President C H Evans
- 4 President's Address Charles H Evans
- 5 Appointment Committee on President's Address
- 6 Report of Secretary, H C Christensen
- 7 Report of Treasurer, J W Gayle.
- 8 Appointment of Nominating Committee, President Evans
- 9 Report of Executive Committee, A L I Winne, *Chairman*
- 10 Presentation of Suggested Amendments to Constitution and By-Laws, L C Lewis, *Chairman*

MONDAY, AUGUST 5, AT 1 30 P M—SECOND SESSION—ASSEMBLY HALL ROOM

- 1 Report of Advisory Examination Committee, H C Christensen, *Chairman*
- 2 Report of Syllabus Committee

3 Report of Legislative Committee, Mac Childs, *Chairman*

4 Report of Committee on National Legislation, R L Swain, *Chairman*

5 Report of Committee on Prerequisite, R W Fleming, *Chairman*

6 Report of Publicity Committee, Rowland Jones, *Chairman*

7 Report of Grievance Committee, W M Hankins, *Chairman*

8 Report of Committee on National Certificate, H C Christensen, *Chairman*

9 Report of Committee on Minimum Standards of Technical Equipment, A C Tayler, *Chairman*

10 Report of Committee on Pharmaceutical Jurisprudence, Roy B Cook, *Chairman*

11 Report of Committee on Code Matters, R L Swain, *Chairman*

12 Report of Banquet Committee, Linn E Jones, *Chairman*

MONDAY, AUGUST 5, AT 6 30 P M—N A B P BANQUET—ASSEMBLY HALL ROOM

TUESDAY, AUGUST 6, AT 9 00 A M—JOINT SESSION—ASSEMBLY HALL ROOM

National Association of Boards of Pharmacy and American Association Colleges of Pharmacy—program to be announced later

TUESDAY, AUGUST 6, 1 30 P M—FINAL SESSION—ASSEMBLY HALL ROOM

- 1 Reports of Vice-Presidents
District No 1, George Moulton
District No 2, John M Woodside
District No 4, Albert E Ely
District No 5, Wm C Muesing
District No 6, Mac Childs
District No 7, R C Shultz
- 2 Report of Committee on President's Address
- 3 Report of Department of Education, R L Swain, *Director*
- 4 Report of Committee on Constitution and By-Laws, L C Lewis, *Chairman*
- 5 Report of Resolutions Committee, A C Taylor, *Chairman*
- 6 Report of Committee on Plaque, J A J Funk, *Chairman*
- 7 Reports of Special Committees
- 8 Unfinished Business
- 9 New Business
- 10 Report of Nominating Committee
- 11 Election and Installation of Officers
- 12 Adjournment

**Thirty-Sixth Annual Meeting of the
AMERICAN ASSOCIATION OF
COLLEGES OF PHARMACY**

HOTEL MULTNOMAH, PORTLAND, OREGON,
AUGUST 5-6 1935

OFFICERS

President, Ernest Little, *Vice President*,
Antone O Mickelsen, *Secretary Treasurer*,
Zada M Cooper, *Chairman of the Executive
Committee*, Charles B Jordan

MONDAY, AUGUST 5TH

9 00 A M Meeting of Executive Committee—
Empire Room

9 30 A M Meetings of Teachers' Conference

Conference of Teachers of Pharmacy, Monday,
August 5th, 9 30 A.M.—Junior Ball Room

OFFICERS

Chairman, W G Crockett *Vice-Chairman*,
Leon W Richards, *Secretary* Emery T
Motley

Program

A Round Table Discussion of Pharmaceu-
tical Technique as Described in the Syllabus

Conference of Teachers of Chemistry, Monday,
August 5th, 9 30 A M —Club Room

OFFICERS

Chairman Marion L Jacobs, *Secretary*,
John C Bauer

Program

1 Instruction about Synthetics, E V Lynn
Discussed by—George L Webster and
Glenn L Jenkins

2 The Teaching of Food and Drug Analysis
C C Glover Discussed by—Russel A
Cain and Frederick Grill

Conference of Teachers of Pharmacognosy and
Pharmacology—Monday, August 5th, 9 30
A M —Colonial Room

OFFICERS

Chairman, A John Schwarz, *Secretary*
Charles E F Mollett

Program

Topics for Discussion

1 Pharmacology Definition and Scope of
the Course for Pharmacy Majors
Frank H Eby and H M Burlage

2 Should the Term Materia Medica Be
Deleted from Our Catalogs and from
State Board Examinations? C E
Mollett

3 Should Undergraduate Students in Phar-
macy Do Animal Experimentation or
Should the Course Be Taught by
Demonstration? F J Bacon

4 Biological Assays for Undergraduate
Students in Pharmacy, D B R
Johnson

5 Correlation of the Courses in Pharma-
cology and Physiology, Dr Van Loan

6 Pharmacology as a Basis for Improving
Relations with Physicians, B V
Christensen

7 Suggestions for a Course in Botany for
Pharmacy Students, H M Wilson and
Ralph Bienfang

Paper—'A Study of the Records of the Same
Class in Botany and Pharmacognosy,'
Marin S Dunn

Conference of Teachers of Pharmaceutical
Economics—Monday, August 5th, 9 30 A M —
Marine Room

OFFICERS

Chairman, Paul C Olsen *Secretary*, John F
McCloskey

Program

Topics for Discussion

Trends in drug store profits 1932 1933 and
1934

Accounting records necessary and desirable
in drug stores

The operation of state fair trade acts for re-
sale price control

SESSIONS OF THE ASSOCIATION

First Session, Monday, August 5th, 1 30
P M —Junior Ball Room

Roll Call

Appointment of Committee on Resolutions

Address of the President Ernest Little

Report of the Secretary Treasurer Zada M
Cooper

Report of Executive Committee Charles B
Jordan

Appointment of the Nominating and Audit-
ing Committees

Paper—"The Four Year Course in Phar-
macy" C O Lee and H G DeKay

Reports of Standing Committees

Committee on Educational Standards
Edward Spease

Committee on Curriculum and Teaching Methods, Robert C Wilson

Committee on Activities of Students and Alumni, George C Schlucks

Delegates to the American Council on Education, Rufus A Lyman

MONDAY, AUGUST 5TH, 6 00 P M

Annual Dinner

Address by Dean E H Lauer of the University of Washington

Second Session, Monday, August 5th, 8 00 P M —Junior Ball Room

Reports of Standing Committees (*Continued*)

Committee on Relation of Boards and Colleges, D B R Johnson

Committee on Libraries, Charles O Lee

Committee on Problems and Plans, Rufus A Lyman

Papers—"Objectives and Objective Tests" For Qualitative Analysis, H G DeKay

For Organic Chemistry, C J Klemme

Syllabus Committee, J G Beard

Paper "The Teaching of Bacteriology to Pharmacy Students," George F Reddish

Reports of Special Committees

Committee on Student Branches of the AMERICAN PHARMACEUTICAL ASSOCIATION, George L Webster

Committee on the Establishment of a Pharmaceutical Corps in the United States Army, Townes R Leigh

Committee to Study List of Crude Drugs Prepared by District No 2, Heber W Youngken

Joint Session of the National Association of Boards of Pharmacy and the American Association of Colleges of Pharmacy, Tuesday, August 6th, 9 00 A M —Assembly Hall Room

Report of the Fairchild Scholarship Committee, E G Eberle

Paper—"The Possibilities and Limitations of Cooperation between Boards of Pharmacy and Colleges of Pharmacy," Robert P Fischels

Report of Recommendations or Resolutions Referred from District Meetings, D B R Johnson

Third Session, Tuesday, August 6th, 2 00 P M —Junior Ball Room

Reports of Special Committees (*Continued*)

Committee on Membership Standards, A G DuMez

Committee on Code Matters, W F Rudd

Committee on Food and Drug Legislation, Charles B Jordan

Report of Committee on Resolutions

Reports of Special Representatives

Representative on American Council on Pharmaceutical Education, A G DuMez
Reporter on Biological Abstracts, Heber W Youngken

Representatives to National Conference on Pharmaceutical Research, Glenn L Jenkins

Representatives to National Drug Trade Conference

Representatives to the Druggists' Research Bureau, Paul C Olsen

SCIENTIFIC SECTION OF THE PROPRIETARY ASSOCIATION

At the recent meeting of the Proprietary Association plans were formulated for work of the Scientific Section under direction of Dr Geo F Reddish, assisted by Dr Frederick J Cullen. The foregoing will be assisted by a group of three scientists, to be appointed

OFFICERS OF THE PROPRIETARY ASSOCIATION

The election for officers of the Proprietary Association resulted in the unanimous returning of the retiring executives to office, as follows: *President*, Frank A Blair, New York, *Honorary Vice President* Dr V Mott Pierce, Buffalo, *First Vice-President*, Henry F Bristol, New York, *Second Vice-President* E K Hyde, Buffalo, *Third Vice-President*, J H Howe St Louis, *Secretary-Treasurer*, Charles P Tyrrell, Syracuse

N W D A CONVENTION

The sixty-first annual convention of the National Wholesale Druggists Association will be held September 29th to October 3rd at the Greenbrier Hotel, White Sulphur Springs W Va. R C Treseder is chairman of the arrangements and entertainment committee

COMMITTEE REPORTS

COMMITTEE ON RESEARCH, AMERICAN PHARMACEUTICAL ASSOCIATION

H V ARNY, CHAIRMAN

The question of the 1935-1936 award from the A P H A Research Fund has been given the careful consideration of the Research Committee, and by mail ballot, it was decided that the grant of \$1000 00 be devoted to *one special piece of research*, subject to be decided upon at the August meeting of the Research Committee during the A P H A Convention in Portland, Oregon

The fine work on drug extraction performed by Dr W J Husa and his associates during the past three years and financed by grants from the A P H A Research Fund encourages the Research Committee in the belief that another extended piece of worth-while research is desirable, and this notice is being published by way of an invitation to workers in the field of pharmaceutical research to suggest topics suitable for the creation of a research project to be financed from the A P H A Research Fund

All such suggestions (or applications) shall be laid before a special sub committee consisting of Messrs Cook, Gathercoal, Scoville Beal and Arny who will make specific recommendations of the entire membership of the Research Committee at its Portland meeting At that time the Committee will decide upon the subject of the research project and the person to whom the task will be entrusted, and the recommendations of the Committee will then be transmitted to the A P H A Council and to the General Session of the ASSOCIATION for final action

Suggestions as to topics and requests for the grant should be sent to the *chairman* of the Research Committee H V Arny, 115 W 68th St, New York, N Y, not later than July 10 1935

NATIONAL FORMULARY EXHIBIT AT THE AMERICAN MEDICAL ASSOCIATION CONVENTION *

BY ADLEY B NICHOLS

As usual the National Formulary held an exhibit in the Scientific Section at the annual convention of the American Medical Association, convened this year at Atlantic City, N J, during the week of June 10th

In this year's exhibit advantage was taken of the fact that the new National Formulary will appear shortly A number of the new items were featured, in an attempt to arouse interest and to have the physicians prepared and "up to date," as one of the cards announced

Dr Bernard Fantus, of Chicago, a member of the National Formulary Revision Committee presented a paper before the association, in which he discussed many of the new National Formulary products, together with some of the old, and numerous items of related interest Dr Fantus' paper was used as a basis for the National Formulary exhibit

The central section of the National Formulary booth was devoted to a half dozen interesting vehicles The physician to day desired to find out how to make his prescriptions as tasty as possible and he thoroughly appreciates whatever help he can obtain along this line Vehicles have been shown repeatedly in these exhibits, and still continue to be a real drawing card It must be remembered that since the American Medical Association meets in a different section each year, a great many of these in attendance come from the nearby territory and consequently even a repeated item is new to them

The following preparations were included in the central section, Syrup of Acacia, which has been modified for the N F VI, Syrup of Cherry, a striking new vehicle, which received front page attention in the *Philadelphia Evening Bulletin* and *Associated Press News* dispatches, Syrup of Cinnamon and Syrup of Glycyrrhiza, both remodeled N F products, and Syrup of Raspberry, an old favorite which was shown again, because of its popularity

One of the side wings was given to the presentation of the new Iso alcoholic Elixir of the N F VI This was well received and it is hoped that pharmacists will make themselves thor

* Atlantic City, N J, June 10-14 1935

oughly acquainted with the many possibilities of this preparation and be prepared to sponsor it when the N F VI appears Emulsion of Cod Liver Oil with Egg and the New Emulsion of Liquid Petrolatum and Phenolphthalein were also shown on this side of the booth

National Formulary Exhibit at A M A convention, Atlantic City June 10-14, 1935

The other side carried a special display of assorted collapsible tubes and tips, together with ointments and jellies illustrating the specific uses of eye tips, nasal tips, rectal tips, etc. This display was based upon the paper by Dr. Fantus.

As usual, a booklet was prepared briefly covering the high spots of the exhibit and approximately fifteen hundred of these were distributed during the session.

LOCAL BRANCHES

(Continued from page 498)

CHICAGO

The regular monthly meeting of the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on April 16th, at the University of Illinois College of pharmacy. The speaker of the evening was Dr. Paul N. Leech, secretary of the Council of Pharmacy and director of the American Medical Association Chemical Laboratory.

Dr. Leech discussed "Some Topics of Interest to the Pharmacist and Physician."

The discussion began with a review of the present Pure Food and Drugs Act and of the progress being made with the bill before Congress at the present time to strengthen the act.

Dr. Leech stated that so many changes were constantly being made with the present bill that it is absolutely impossible to keep up with the changes and presented the last revised copy of the bill that he had received and which had since been changed.

It was stated that the present bill was good for all of those except where the shoe did not fit and in most cases where it did not fit the objections were against the welfare of the public.

Dr. Leech stated that the present bill had been emasculated and that he hoped for a better bill than the present one as it stands before Congress. Certainly the present law is inadequate but maybe it would be better to amend it than to adopt the new one in its present condition.

Slides were shown and discussed showing the evolution of medicines during the past thirty years This brought out the ease with which testimonials could be obtained from reliable doctors then as compared to now

Slides were shown giving a comparison of trade marked drug prices as compared to similar U S P and N F products The price was unquestionably in favor of the official drugs

Attention was drawn to the many super advertised drugs on the market that are not what their names or description imply Mention was made of many drugs that have been tested by the American Medical Association Laboratories that did not come up to standard It was pointed out that we were not being led to believe that the entire drug trade was in this condition but that only some of the ' sore thumbs' had been discussed to show that there is need for a stricter supervision over those firms who do not have the welfare of the public at heart

Dr Leech made mention of the dearth of new drugs being discovered in America before the war and the rapid progress made in this country since the war At first we began producing many new products of an organic extract nature, then synthetics and now the center of attention seems to be in the biologicals

LAWRENCE TEMPLETON, *Secretary*

NORTHERN NEW JERSEY

The Northern New Jersey Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION held its second annual Physician's Night as its April meeting, on April 15th Due to the development during the year of the New Jersey Formulary the greater part of the evening was devoted to a discussion of this important project William Richert, of Elizabeth, addressed the physicians and pharmacists on the work from the viewpoint of the pharmacist and Dr H B Wilson of Hackensack, discussed the physician's views The Formulary Committee made a display of the various preparations which thus far have been included in the formulary and following the meeting answered questions pertaining to the compounding and use of each product

Dr Hans Molitor, director of the Merck Institute of Therapeutic Research addressed the meeting on the subject, "Therapeutic Research and Its Relation to Pharmacy Medicine and Chemistry," in which he explained the objects of research in developing new drugs justifying the use of old drugs, and in developing new uses for old drugs

The May meeting of the Branch will take the form of a testimonial dinner to Dean Ernest Little in recognition of his services to the profession as president of the American Association of Colleges of Pharmacy The dinner will be held at the Hotel Robert Treat Newark on Monday night, May 20th, at seven o'clock

The officers of the Branch are *President*, George C Schicks, *Vice President* Robert W Rodman, *Secretary*, C L Cox, *Treasurer*, A F Marquer

C L Cox, *Secretary*

PHILADELPHIA

The April meeting of the Philadelphia Branch, AMERICAN PHARMACEUTICAL ASSOCIATION was held in the Temple University, Medical School, Broad and Ontario Streets on April 16 1935

President MacLaughlin called the meeting to order at 8 30 P M The minutes of the March meeting were read and approved as read

Upon a motion by Dr Munch, seconded by Ambrose Hunsberger Dr A T Pollard was elected to Honorary Life membership in the Philadelphia Branch

President MacLaughlin appointed the following committees

Committee on Professional Relations H Evert Kendig, *Chairman*, Dr Wilmer Krusen Charles H LaWall

Committee on Practical Pharmacy Ambrose Hunsberger, *Chairman*, Quintus Hoch Charles T Pickett

Committee on Membership Dr James C Munch, *Chairman*, Alfred Barol Frank H Eby Geo K Schacterle Harvey P Frank, William J Stoneback

Committee on Entertainment Adley B Nichols

The speaker of the evening, Prof Marvin R Thompson of the School of Pharmacy University of Maryland, was then introduced His topic was 'Recent Developments in the Pharmacology and Therapeutics of Ergot' After a brief historical sketch on the introduction of Ergot

into medical practice, the speaker outlined the constituents found in the drug. He summarized, most masterfully, the amino bases and specific alkaloids found in Ergot and discussed the pharmacodynamics of each. He stated that pharmacologically and clinically Ergostetrine proved to be the most active of the alkaloids. The alkaloid "Ergostetrine" discovered and isolated by Prof. Thompson was discussed in detail.

In discussing the U S P X Cock's Comb Test, Prof. Thompson stated that it seemed to be the most satisfactory test known at the present time, but also he said, that in a sample of Ergot showing a 100% pharmacological activity, 75% of the activity was due to all the Ergot alkaloids and 25% of the activity was due to ergostetrine, whereas clinically 75% of the activity was due to ergostetrine and only 25% of the activity was due to the other alkaloids.

Prof. Thompson was greatly in favor of the use of aqueous or hydro alcoholic extracts of the drug rather than its specific alkaloids.

After a general discussion of the subject a rising vote of thanks was given the speaker for his most interesting lecture.

GEORGE E. BYERS, *Secretary*

NEW JERSEY INTENDS TO MAKE "PRACTICAL EXPERIENCE" MEAN SOMETHING

BY ROBERT P. FISCHELIS

The new New Jersey law which deals with practical experience was signed by the Governor on May 31st, and becomes effective July 1, 1936. The following is taken from a statement made by the secretary of the Board of Pharmacy of the State of New Jersey, Robert P. Fischelis:

"The new legislation provides

"1 That the applicant shall have not less than four years of practical experience obtained in accordance with the rules and regulations of the Board of Pharmacy under a Registered Pharmacist in a registered pharmacy where prescriptions of medical practitioners are compounded and drugs are sold at retail, and which registered pharmacy is approved by the Board of Pharmacy for such purpose.

"2 A credit of not more than three years may be given in lieu of store experience for an equal time spent in a course of study and laboratory instruction in a school of pharmacy approved by the Board of Pharmacy.

"3 The Board of Pharmacy is authorized to conduct written examinations in the theoretical subjects for applications for registration at any time after the applicant has been graduated from an approved college of pharmacy.

4 No candidate shall be examined in practical pharmacy and laboratory work until he has met all of the requirements for registration provided in the law and rules of the Board, and such requirements shall include one year of practical experience served under the supervision of a Registered Pharmacist *subsequent* to graduation from an approved college of pharmacy,

in a pharmacy approved by the Board for such purpose.

"5 The successful passing of the examination in theoretical subjects confers no rights or privileges upon the applicant in connection with the practice of pharmacy in the State of New Jersey.

"Rules and regulations for the enforcement of the new experience requirement have not been made, but they will be made with great care and will be announced in due course. It is important for future applicants in New Jersey to note that until July 1, 1936, the present requirements of four years of practical experience with an allowance not to exceed two calendar years for work completed in an approved college of pharmacy, will remain in effect. Applicants who take the examination after July 1, 1936, will be permitted to qualify for the theoretical tests immediately after graduation. They may acquire as much practical experience as they desire before or during their college course but in every instance they must present, in addition, one full calendar year of experience obtained in accordance with the rules of the Board in a pharmacy approved for practical experience by the Board.

"It is self evident that every type of drug store or pharmacy in existence under the laws of the state is not a satisfactory place for acquiring practical experience. The determining factors which will qualify stores as satisfactory places for acquiring practical experience will be announced in due course."

OKLAHOMA HEALTH EDUCATION

The Oklahoma Pharmaceutical Association's program seeks to cooperate with the State Medical Society. It plans health education and coordinates pharmaceutical merchandising.

EDITORIAL NOTES

THE 1935 CONGRESS OF PHARMACY

Dr J J Hofman, president of the International Pharmaceutical Federation, has expressed the hope that the Federation will be able to count on a large attendance. This, indeed, seems probable, since side by side with this assembly there will be held a few days later an International Congress of Pharmacy, in which not only the members of the Federation will be able to participate, but every pharmacist and indeed every person interested in pharmacy whether as a science or as a profession. The general assembly of the International Pharmaceutical Federation will be held on July 29th and 30th and the International Congress from July 30th to August 6th.

ANNUAL REPORT FOR 1934 OF CENTRAL NARCOTICS INTELLIGENCE BUREAU, EGYPTIAN GOVERNMENT

The reports of the Central Narcotics Intelligence Bureau speak for careful study of the important subject of narcotic addiction and the efforts made to correct the conditions. Evidently from the report, drug addiction has been reduced. The number of arrests, the methods of smuggling and the kinds of narcotics used by addicts are carefully reported, specific cases are detailed as to the evidence for conviction and the punishments assessed. The narcotics reported on differ in the several tables, most of them include cocaine, morphine, heroin, opium, hashish, manzoul and "other narcotics." Manzoul consists of a mixture of hashish, dry spices and herbs and under "other narcotics" there are various mixtures with chocolate. Other lists report on the occupations represented, ages, nationalities, etc.

Chapter IV is entitled "A New Plague in Egypt" and the name is "Black Tea." It can never be foretold what may become an addiction and affliction, and therefore—because the use of tea seems now to be extensively misused, whereas before the war the use was limited and not in the manner which makes it more or less of a menace—reference is made. The reporter admits of the probable usefulness of tea as a beverage when properly prepared, but the harm is in the concentrated decoction from tea leaves or tea dust boiled in the water, and re-boiled with further additions of tea, adding more tea leaves and water from time to time. This produces a heavy brown, bitter mixture

which through its constricting and irritating properties is deleterious, producing indigestion and aggravating disorders such as ulcers and hyperacidity, septic absorption and the nervous effects of toxic infection. Additions are made of powdered nutmeg, date palm, etc., but the concentrated tea is the basis of the beverage and the ill effects, the tea drinker eventually prefers the beverage to food.

MEMBERSHIP PRIZES IN THE A P H A

Massachusetts College of Pharmacy through members of the faculty has presented as prizes the following memberships in the AMERICAN PHARMACEUTICAL ASSOCIATION:

Arthur M Thompson, Organic Chemistry Award, offered by Treasurer Gammon, Nicholas Kafalas, *Materia Medica*, awarded by President Glover, Richard C O'Leary Pharmacy Prize, offered by Professor LaPierre, Commercial Pharmacy, Walter J Lusinski awarded by Vice President Ellis, Analytical Chemistry, awarded to Elie J Hudon, offered by Dean Theodore Bradley.

Recommendation to membership in and one year's dues to the AMERICAN PHARMACEUTICAL ASSOCIATION has been awarded to several students at the College of Pharmacy of the State University of Iowa for high scholarship.

Dean Teeters' prize for excellence in pharmacognosy was won by John X. Power, '35, Newton, Iowa.

Professor Cooper's prize to the highest ranking student in manufacturing pharmacy was awarded to William B Day, '36, Davenport, Iowa.

Nicholas W Solonen won the Scherling prize for highest rank in organic chemistry. This prize is given by Mrs Scherling of Sioux City in memory of her husband.¹ Mr Solonen also won Professor Kuever's prize for excellence in operative pharmacy. This prize is one year's subscription to the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

PERSONAL AND NEWS ITEMS

Industrial and Engineering Chemistry celebrated the 65th birthday of Prof Reid Hunt, former president of U S Pharmacopoeial Convention.

¹ Member, A P H A from 1884 until his demise in 1933.

Pharmacists from all parts of the state gathered May 13th, in the Connecticut College of Pharmacy, to take part in ceremonies centered about the unveiling and presentation of a steel engraving of the late P J Garvin to the college. The ceremonies were simple and proved very impressive, with Miss Alice-Esther Garvin, daughter of the late Mr Garvin, unveiling the engraving. Among the speakers were Thomas E Nugent, William J Coughlan, Hugh P Beirne and Curt P Wimmer. Dean Henry S Johnson accepted the engraving in behalf of the college.

Our honorary member, William Mair, contributed an article in the May 18 1935, issue of the *Chemist and Druggist* relating to the A P H A, the Stabler-Leadbeater Apothecary Shop and the conditions in American pharmacy.

George P Forrester, of the *Chemist and Druggist*, has discontinued editorship of the *Chemist and Druggist* and is taking up an appointment with the Imperial Chemical Industries.

Dr Wm F Notz, dean of the Georgetown University School of Foreign Service and internationally known economist, died June 4th, at his residence in Washington. Dr Notz was the son of Dr F W A Notz, a pioneer Wisconsin educator, Northwestern College, Watertown Wis.

Harold Hutchins has been named managing editor of the *American Druggist*.

Frazer Affleck will entertain the Veteran Druggists and their wives at Deep Cove, Md., on July 2nd.

Walter S Nicklin, Jr, son of our esteemed member in Alexandria, won the Henry E Kalusowski prize, presented by District of Columbia Pharmaceutical Association through George Washington University School of Pharmacy for highest proficiency in pharmacy. Another prize winner is F Royce Franzoni.

At the Commencement of the University of Pittsburgh on June 5th, the honorary degree of "Doctor of Science" was conferred on William A Hamor, assistant director of Mellon Institute of Industrial Research.

Mrs L S Williams, Baltimore, has presented a copy of Boerhaave's *Materia Medica*—a series of prescriptions—London, 1741.

Mrs Mary E Apple (Franklin M.) has donated a volume *Chemical Amusement, a Series of Curious and Instructive Experiments in Chemistry*, by Frederick Accum, London, 1818.

Dean Charles H LaWall, of the Philadelphia

College of Pharmacy and Science, will sail on July 3rd, for Copenhagen to attend a meeting of the Committee upon Uniform Method of Opium Assay, which has been working under the auspices of the Health Committee of the League of Nations since 1931. The chairman of the committee is Dr L Van Itallie, of the University of Leiden. Other members are Dr Yasuhiko Asahina, of Tokyo, Dr H T Baggesgaard-Rasmussen, of Copenhagen, Professor R Eder, of Zurich, Dr A Goris, of Paris, Dr A W K De Jong, of Medan, Netherlands, Professor Erich Knaff-Lenz, of Vienna, and J R Nicholls, of London. Dr LaWall is representing the U S Treasury Department as a pharmaceutical chemist assigned to this special research—*Science*.

Dean LaWall will represent the American Pharmaceutical Association at the International Pharmaceutical Federation and at the Congress of Pharmacy, meeting at Brussels.

President Joseph Sweetman Ames, of Johns Hopkins University, severed his connection with the university at the fifty ninth commencement exercises after 51 years as a member of the faculty, the last six as head of the institution. Isaiah Bowman was announced as Dr Ames successor.

The Philadelphia College of Pharmacy and Science conferred the honorary degree of Master of Pharmacy' on the following: Eli Lilly, Indianapolis; Dr Wm A Pearson, Philadelphia; John M Woodside, Philadelphia.

Prince Malaku Emmanuel Bayen, of Abyssinia, earned the degree of Doctor of Medicine" at Howard University, Washington. He is a nephew of Emperor Haile Selassie. The Prince enrolled as a member of the Medical School several years ago.

Dr Paul Nicholas Leech, secretary of the Council on Pharmacy and Chemistry visited the American Institute of Pharmacy on his return trip from the meeting of the American Medical Association. Pharmacist Generoso Velasquez of the Philippine General Hospital, Dr Jose E Jimenez, chairman of the Board of Pharmaceutical Examiners and Inspectors, Vice President of Colegio Medico-Farmacaceutico de Filipinas, Vice-President of Philippine Pharmaceutical Association and owner of Farmacia San Fernando in Manila were among recent visitors, also Walton A Hill of Veterans Hospital, Tuscaloosa, and John A Purinton, Jr, Detroit, Mich.

Prof Harold W Werner will continue research in chemotherapy in the Department

of Pharmacology of the University of Wisconsin

HUGO DE VRIES

Hugo de Vries, world famous botanist, died May 21st, at his home near Arnheim, Holland, aged 87 years

Professor de Vries was born at Haarlem in 1848. He earned his degree in natural science at Leyden in 1870, and continued his studies at Wurzburg and Heidelberg, specializing in botany and also studied chemistry. He was appointed to the University of Amsterdam in 1878 and a lecturer at Halle. His great work was done in connection with the development of the theory of mutation as a method of evolution, and it was along these lines of study and research that De Vries earned his place as a leading world scientist.

He published "Intracellular Pangenesis" in 1889, in which he differed from Darwin. The "Mutation Theory" appeared in 1901, "Plant Breeding" in 1907, and other works followed. For about forty years Professor De Vries was director of the Amsterdam Botanical Gardens and member of the faculty of the University of Amsterdam, after his retirement he issued a collection of his writings, which had been separately published or contributed to scientific publications. He declined invitations to faculties of other universities.

ENCOURAGING THE USE OF NARCOTICS

A special correspondent of the *New York Times* reports that "inside the city of Changli there is only one shop that sells narcotics, but outside the city walls there are thirty six shops of which twenty two are owned by Japanese and fourteen by Koreans, selling heroine, morphine and opium quite openly. Throughout the county of Changli there are 163 shops selling these narcotics to Chinese of the demilitarized zone. The first time a customer enters one of these shops he is charged five cents for his purchase. The price rises as the customer becomes addicted."

DOHME PORTRAIT PRESENTATION

The oil portrait of the late Charles E. Dohme, president of the AMERICAN PHARMACEUTICAL ASSOCIATION, 1898-1899, formerly president of the Maryland College of Pharmacy, the forerunner of the School of Pharmacy, University of Maryland, which was given to the institution last October by Dr.

A. R. L. Dohme, was officially presented to the school May 31st. Other speakers were Dr. D. M. R. Culbreth, Dr. Thomas S. Cullen and Charles C. Neal, of Sharp & Dohme.

CHARLES E. DOHME

Dr. A. G. DuMez, dean of the school, acted as master of ceremonies. The portrait was accepted by Dr. Raymond A. Pearson, president of the University of Maryland.

'THE CULTURE OF WHOLE ORGANS'

The above is the title of a paper by Dr. Alexis Carrel and Charles A. Lindbergh which was received as most important research, whereby the means may be afforded for seeing the process of making the hormones and witness the results of their productions and also, how organs succumb to disease.

We are very willing to honor Dr. Carrel for the valuable contributions he has made to medical science, but the participation of Colonel Lindbergh in discoveries add greatly to medical science and are beyond estimation. They speak for his observations and application of them.

The article referred to describes a new method by which 'an organ can be taken out of the body of an animal and kept alive for study under glass the chemical equivalent of a blood stream being supplied by an arti-

ficial heart The organs were handled by Dr Carrel, the mechanical heart was constructed by Colonel Lindbergh "

In 1931 the latter designed a rotating coil of glass to substitute for the heart as a blood

pump, he is credited with inventing a spore-catcher, which he attached to his plane to ascertain how much vegetable life exists in the upper stratus

SOCIETIES AND COLLEGES

CANADA PHARMACEUTICAL ASSOCIATION

Canada Pharmaceutical Association will meet in Victoria B C August 5th-8th, the AMERICAN PHARMACEUTICAL ASSOCIATION will convene in Portland, Oregon, August 5th-10th The two associations meet in the same section and this offers an opportunity for interchange of visitations

SECTIONS AND CONFERENCES PAPERS AT THE PORTLAND MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The list of officers may be found in the roster for your convenience the names of the presiding officers and secretaries are here given Scientific Section, *Chairman*, E V Lynn, Massachusetts College of Pharmacy, Boston, *Secretary*, F E Bibbins 5840 Washington Blvd, Indianapolis, Ind Section on Education and Legislation, *Chairman*, Oscar E Russell, 531 So Main St Elkhart Ind *Secretary*, L W Rising, University of Washington, Seattle, Wash Section on Practical Pharmacy and Dispensing, *Chairman*, H M Burlage, University of North Carolina Chapel Hill, N C, *Secretary* Leon W Richards University of Montana, Missoula, Mont Section on Commercial Interests, *Chairman*, Henry Brown, Scranton, Pa, *Secretary* R T Lakey Cass & Hancock Aves Detroit Mich Section on Historical Pharmacy, *Chairman*, C O Lee Purdue University, La Fayette Ind, *Secretary*, H W Youngken, Massachusetts College of Pharmacy Boston, Mass, *Historian* E G Eberle, 2215 Constitution Ave Washington D C

PROGRAM OF NATIONAL CONFERENCE ON PHARMACEUTICAL RESEARCH 1935 MEETING

PORTLAND, OREGON, SATURDAY, AUGUST 3
HOTEL MULTNOMAH

First Session 2 00 P M

- 1 Call to Order by Chairman
- 2 Appointment of Nominating Committee
- 3 Summary of Year's Activities and Outlook of Conference for the Future, by Chairman Gathercoal
- 4 Reports of Officers
 - a Report of Secretary
 - b Report of Treasurer
 - c Report of Executive Committee by Secretary
- 5 Reports of Standing Committees
 - (1) Physical Chemistry, Arthur Osol *Chairman*
 - (2) Bacteriology and Immunology, Louis Gershenfeld, *Chairman*
 - (3) Pharmacognosy Heber W Younglen *Chairman*
 - (4) Pharmacology and Bioassays, James C Munch, *Chairman*

- 6 Roll Call of Delegates
- 7 Adjournment for dinner Arrangements will be made for a dinner for the delegates assembled

An address pertinent to the work of the Conference will be delivered

Evening Session 8 00 P M

- 8 (5) Medicinal Chemicals, Joseph Rosin, *Chairman*
- (6) Endocrinology, Arthur Grollman, *Chairman*
- (7) Manufacturing Pharmacy, L Wait Rising, *Chairman*
- (8) Pharmaceutical Dispensing, William J Husa, *Chairman*
- (9) Educational Methods, A B Lemon, *Chairman*
- (10) Pharmaceutical Economics, Harry S Noel, *Chairman*
- (11) Historical Pharmacy, Charles H LaWall, *Chairman*
- 9 Reports of Other Special Committees
- (1) Publications, Edward N Gathercoal, *Chairman*
- (2) Census of Research, James C Munch, *Chairman*
- 10 General Discussion of the Status of Pharmaceutical Research
- 11 Election and Installation of Officers
- 12 Adjournment

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

The pharmacy program of the American Association for the Advancement of Science is printed in the April JOURNAL A PH A, page 338 The pharmaceutical organizations of Australia and New Zealand join in the program of the Association for the Advancement of Science of these countries in Section O Pharmaceutical Science The program in Minneapolis on June 27th, was part of Section N (Medical Sciences) and Section N3 (Pharmacy)

AMERICAN MEDICAL ASSOCIATION

The house of delegates of the American Medical Association at its annual meeting in Atlantic City, adopted a resolution which would make the Association a monitor of all radio broadcasting on the subject of medicine heard by the American people regardless of whether the broadcasts originate in this country or in foreign nations

Opposition to the Copeland pure food bill

was expressed in two resolutions They were referred to committees

After four successive years of evading the issue, the Association officially recognized the problem of birth control

A resolution was adopted, providing for the appointment of a special committee by the board of trustees, to study the problem of birth control during the next year and present at least a preliminary report on it at the annual meeting of the house of delegates of the Association in 1936

A preamble to the carefully worded resolution stated that nothing in it was to be interpreted as "a declaration of action either for or against birth control"

OFFICERS OF AMERICAN PHARMACEUTICAL MANUFACTURERS' ASSOCIATION

The following officers of the American Pharmaceutical Manufacturers' Association were unanimously elected

President George R Flint, Decatur, Ill, *First Vice President*, Carroll Dunham Smith Orange, N J, *Second Vice President*, J C Fausnaught, Worcester, Mass, *Secretary*, C W Warner, Newark, N J, *Treasurer*, Frank A Mallett Des Moines, Iowa, *Members of Board of Directors*, three-year terms Carl N Angst, Indianapolis Eliot Frosst, Montreal Quebec, and R Lincoln McNeil Philadelphia two year term (to fill vacancies) R L Maltbie, Newark N J and E T Kirkland Decatur, Ill

DAIRY, FOOD AND DRUG OFFICIALS MEET

The Central Atlantic States Dairy, Food and Drug Officials held their 19th annual convention at the John Marshall Hotel in Richmond on May 14th and 15th The meeting was well attended and was presided over by Major W Catesby Jones of the Chemistry Division of the Virginia Department of Agriculture The gathering was addressed by Governor Peery and by Mayor Bright of Richmond and a number of interesting addresses were delivered by members in attendance These dealt with foods, seeds, fertilizers seafood, insecticides drugs and cosmetics President R P Fischel, of the AMERICAN PHARMACEUTICAL ASSOCIATION delivered an address on Drug Control by the States

The following resolution was presented and adopted

WHEREAS the 19th Annual Conference of the Central Atlantic States Association of Dairy, Food and Drug Officials held at Richmond, Va., on May 14 and 15, 1935, has been one of the most pleasant and inspiring in the entire experience of the Association, and

WHEREAS at this time our thoughts turn to those who in various ways participated to make our Conference successful,

Be It Resolved that this Association extend in this manner their appreciation to Dr. Robert P. Fischelis for the excellent paper on "Regulations of the Manufacture and Distribution of Drugs and Medicines in the Interest of the Consumer" presented by him, and

Be It Further Resolved that a copy of this resolution be spread upon the Minutes of the 19th Annual Meeting of the Association and a copy be forwarded to Dr. Robert P. Fischelis

ANDREW J. KROG, *Chairman,*
Resolution Committee

F. L. WOLLARD,
W. BROWNLEY FOSTER, M. D.

ALABAMA

Dr. James S. M. Lester, president of the American Medical Association, Dr. L. S. Blake, head of the Pharmacy Department, Alabama Polytechnic Institute, and Dr. A. R. Bliss, Jr., were among the speakers at Alabama Pharmaceutical Association, held in Birmingham, June 19th-20th

ILLINOIS

Among the speakers of the Illinois convention at Quincy were E. F. Kelly, Samuel C. Henry, Samuel Shkolnik, Carl Weeks. The following officers were elected: *President*, Howard H. Zorn, Springfield, *First Vice-President*, Edward J. Merriman, Joliet, *Second Vice-President*, Joseph Allegrette, Chicago, *Third Vice-President*, W. E. Brown, Quincy, *Secretary*, William B. Day, Chicago, *Treasurer*, A. W. Reinhardt, Rockford

LOUISIANA

Endorsement was given to a fair trade act, to be introduced in the next legislature. The following officers were elected: *President*, A. J. Bourdreaux, Opelousas, *Vice Presidents*, Joseph Clesy, New Orleans, M. Kirtley, Washington, Henry Richardson, Shreveport, Eugene Voght, Ferriday, John E. Guess, Hammond, Roy Bridges, Alexandria, *Recording Secretary*, Joseph H. Berner, New Orleans, *Corresponding Secretary*, Paul Weilbacher, New Orleans, *Treasurer*, Elmo D. Ciro, New Orleans

TEXAS

Texas Pharmaceutical Association elected the following officers

President, C. C. Harris, Houston, *First Vice President*, B. B. Brown, Dallas, *Second*

Vice President, Festus A. Pierce, Corsicana, *Secretary-Treasurer*, W. J. Danforth, Fort Worth. *Members of the Executive Committee*, Henry F. Hein, San Antonio, E. B. Oliver, Longview, Shine Philips, Big Spring, Murray Thames, Beaumont, Roy Pool, Amarillo

Secretary Walter D. Adams was elected editor of *Texas Druggist* and the publication was changed from a quarterly to a monthly

Among the speakers of the convention were Charles E. Turner, Mayor of Dallas for a number of terms and a former druggist, now finance director for the Texas Centennial Central Exposition, Representative R. L. Reader, H. L. Chichester, Macon, Ga., N. A. R. D. vice president, and Tom Roach of Oklahoma City

The Veteran Druggists' Association held its annual session, presided over by President A. H. Seely

WEST VIRGINIA

West Virginia Pharmaceutical Association held its annual meeting at Parkersburg, June 17th and 18th. Among the speakers scheduled were R. L. Swain, John Dargavel and State Senator G. O. Young

FLORIDA

The Florida Pharmaceutical Association was successful in point of attendance and program. A feature of the convention was the University Hour and tribute to Dr. James H. Beal

The following officers were elected: *President*, Victor Wray, Haines City, *First Vice President*, George Taylor, Miami Beach, *Second Vice-President*, George H. Grommet, Miami, *Third Vice President*, R. L. Gaddy, Tallahassee, *Secretary-Manager*, Max S. Adler, Tampa, *Place of Meeting*, West Palm Beach. Time, 1936

A speaker of the convention was Dr Robert C Wilson, dean of the School of Pharmacy, University of Georgia, on the subject of "The Sale of Drugs in Drug Stores." Other speakers were Drs P A Foote, Townes R Leigh, C G Hamilton and B V Christensen.

The words of tribute honoring Dr James H Beal were delivered by H C Shuptrine, a former president of the N A R D An honorary life membership in the Florida Pharmaceutical Association and a beautiful desk set were presented to the honored guest who responded in expressions of appreciation and gratitude.

GEORGIA

The following officers were elected by Georgia Pharmaceutical Association

President, R Lee Olive, Augusta *First Vice President* H S Peters, Manchester *Second Vice President*, J W Brinson, Wrights ville, *Third Vice President*, W W Fincher, Canton, *Secretary Treasurer* Z O Moore Atlanta Macon was selected as the convention city in 1936

A resolution was passed expressing regret because of the absence of W S Elkin, Jr

H S Noel and John W Dargavel were among the speakers of the convention

Expression of appreciation was given to the AMERICAN PHARMACEUTICAL ASSOCIATION and Secretary E F Kelly, for their part in the National Drug Trade Code, also to Secretary John W Dargavel who was present at the meeting and appreciation was expressed because of the service rendered by that organization

NORTH CAROLINA

Dr Howard E Rondthaler President of Salem College, Winston Salem, was one of the principal speakers at the annual meeting of North Carolina Pharmaceutical Association His address was well received and devoted largely to the interests of North Carolina and neighbor states Tribute was paid to F W Hancock, veteran Oxford druggist, who has attended fifty-four out of the fifty six conventions of North Carolina Pharmaceutical Association W C Porter, an uncle of O Henry, made a brief address The following officers were elected

President, R A McDuffie, Greensboro, *First Vice President* W C Ferrell Nashville, *Second Vice-President*, E C Adams, Gastonia, *Third Vice President* R P Rogers Durham, *Secretary Treasurer* J G Beard Chapel Hill,

Members of the Executive Committee J C Hood, Kinston, I W Rose, Chapel Hill, E E Thomas Roxboro

SOUTH CAROLINA

Timely addresses were features of the South Carolina convention Among the speakers of the convention were H S Noel, D W Daniel of Clemson College, and J H Landess of Memphis

The following officers were elected for the ensuing year *President*, V F Platt Conway, *First Vice President* L A Melchers, Jr Charleston *Second Vice President*, P C McCollum Clemson College, *Third Vice President* T H Turner, Columbia *Secretary Treasurer*, J M Plaxco Due West

Myrtle Beach was chosen for the convention city in 1936

(To be continued)

NATIONAL DRUG CODE AUTHORITY

The former members of the National Drug Code Authority met June 8th for the purpose of taking steps to wind up the affairs of that organization There were present J A Goode, Wheeler Sammons J W Dargavel and E F Kelly The accounts of the organization were submitted for proper audit

The files, records and papers of the Authority were turned over to Secretary E F Kelly for a period of one year and then to the American Institute of Pharmacy for such historical use as can be made of them

Liberty is taken in quoting from *Drug Topics*, of June 10th by R L Swain

"(NRA) has made a lasting contribution to decent business and public morals The codes imperfect as they were, recognized the necessity of team-work and cooperation Business has learned that good wages, humane hours and fair attitude toward competitors are not only attainable but highly desirable NRA has added vastly to the heart and soul of business as a whole It has been a boon to retail pharmacy

"What are the facts? First of all the code recognized the need for price stabilization in the drug field The cost definition was the very principle which decent business fought for in the Capper Kelly Bill and it is the identical principle underlying the Fair Trade acts This open recognition on the part of the government is a priceless gain

"Then, too the code proved that reasonable price regulation is in the interest of the consumer Drug products declined in price under the code A legitimate profit can be made without adding to the cost of living and is beneficial to all The cost definition is complete proof that price stabilization is sound business practice "

The wholesale group, on December 6th, conferred with the Federal Trade Commission for the purpose of studying practices that are the major causes of unfair and unethical competition (See December JOURNAL 1934, page 1252) Reference is made because the discussion emphasized principles that are basic in fair practice

UNIVERSITY OF MARYLAND SCHOOL OF PHARMACY

The following completed their work in the Graduate School of the University of Maryland and were awarded the Doctor of Philosophy degree Samuel W Golstein L Lavan Manchey, Emanuel Veritus Shulman and Frank J Slama They have been members of the teaching staff of the School of Pharmacy

Two former graduates of the School of Pharmacy were honor men in the School of Medicine—George Frederick Schmitt, Jr, received the University Prize Gold Medal, Edward Francis Cotter received the second Certificate of Honor and the Dr A Bradley Gaither Memorial Prize for the best work in genito urinary surgery during the senior year Fourteen other members of the graduating class of the School of Medicine were graduate pharmacists The Master of Science degree was conferred on Charles F Bruening and Louis L Sherman, who completed the major part of their work in the School of Pharmacy Governor Nice of Maryland was the principal speaker at the commencement exercises of the University The degree of Doctor of Laws was conferred on the Governor

A large bequest to the University of Maryland Medical School was made in the will of the late Dr Frank P Bressler of Baltimore The sum is estimated at considerably over \$1,000,000 00

DUQUESNE UNIVERSITY

Dr H V Army, dean of the College of Pharmacy of Columbia University, was guest speaker at Duquesne University School of Pharmacy The subject of his address was entitled ' Five Times Ten Years in Pharmacy, "

in which he gave a short résumé of the personalities and the work of former presidents of the AMERICAN PHARMACEUTICAL ASSOCIATION and a pithy exposition of true professional pharmacy as it is, as it can be and as it should be in the days that are to come

An oil painting of Dean Hugh C Muldoon was presented by the students and graduates and accepted by President Callahan

CORVALLIS SCHOOL OF PHARMACY

Oregon State Daily Barometer, of May 24th, devotes the greater part of a page to the School of Pharmacy, its dean, faculty and activities

TEMPLE UNIVERSITY

Temple University, Philadelphia, has announced the establishment of a biological field station at Quaker Bridge N J, for the use of Summer school students taking courses in field botany and field zoology, sessions will continue until August 9th

OKLAHOMA PHARMACY ALUMNI ELECT OFFICERS

Jess W Stunkle, of Enid, has been elected president of the Oklahoma Association of Graduate Pharmacists, to succeed Everett E Duncan, who was recently elected president of the Oklahoma State Pharmaceutical Association

Other officers are C V Nichols, of Anadarko, and Leonard Reynolds of Tulsa, *Vice-Presidents*, Mrs J E Wyly, Spavinsaw, *Secretary*, and Guy Scroggs, Tulsa, *Treasurer*

Members of the executive council are the officers and Miss Ina Griffith, Apache, James Hamilton, Holdenville, R H Mays, Duke, E E Duncan, Oklahoma City, G M Pearce Drumright, Harlan Fuller, Minco, and John Helvey, Lawton

THE COPELAND BILL

The Senate passed the Copeland Bill It has been referred to the Interstate and Foreign Commerce Committee of the House of which Congressman Sam Rayburn is the chairman The latter has stated that if no substantial opposition to the bill develops, the committee will take it up

HOTEL RATES AT PORTLAND

The rate at Multnomah for one person is \$2 50 and up, shower bath, tub \$5 00, two persons \$4 00 and \$8 00 The Imperial has a

rate from \$1 50 up Garage service \$3 00 per week Among other large hotels are Benson, Carlton, Congress, Heathman, Mallory, New Heathman and Portland

James L. O'Neill, a vice president of the Guaranty Trust Company of New York,

has assumed the office of Administrator of the new NRA He started work as an office boy with Bradstreet, for twenty two years he was with Carnegie Steel Company and became associated with the Guaranty Trust Company in 1918

NOTICE TO CONTRIBUTORS TO THE JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION

The following notice has been prepared from comments received from members of the Board of Review of Papers and of the Publication Committee

Manuscripts should be sent to Editor E. G. Eberle, 2215 Constitution Ave., N. W., Washington, D. C.

All manuscripts should be typewritten in double spacing on one side of paper 8 1/2 x 11 inches, and should be mailed in a flat package—not rolled The original (*not* carbon) copy should be sent The original drawings, not photographs of drawings should accompany the manuscript Authors should indicate on the manuscript the approximate position of text figures All drawings should be marked with the author's name and address

A condensed title running page headline not to exceed thirty-five letters, should be given on a separate sheet and placed at the beginning of each article

The method of stating the laboratory in which the work is done should be uniform and placed as a footnote at end of first page, giving Department, School or College The date when received for publication should be given

Numerals are used for figures for all definite weights, measurements, percentages and degrees of temperature (for example 2 Kg, 1 inch 20.5 cc, 300° C) Spell out all indefinite and approximate periods of time and other numerals which are used in a general manner (for example one hundred years ago, about two and one half hours, seven times)

Standard abbreviations should be used whenever weights and measures are given in the metric system, e. g., 10 Kg, 2.25 cc, etc The forms to be used are cc, Kg, mg, mm, L and M

Figures should be numbered from 1 up, beginning with the text-figures (line engravings are always treated as text-figures and should be designated as such) and continuing through the plates The reduction desired should be clearly indicated on the margin of the drawing All drawings should be made with India ink preferably on white tracing paper or cloth If coordinate paper is used, a blue lined paper must be chosen Usually it is desirable to ink in the large squares so that the curves can be more easily read Lettering should be plain and large enough to reproduce well when the drawing is reduced to the width of a printed page (usually about 4 inches) Photographs intended for half tone reproduction should be securely mounted with colorless paste

Figure" should be spelled out at the beginning of a sentence, elsewhere it is abbreviated to Fig, " per cent—2 words

The expense for a limited number of figures and plates will be borne by the JOURNAL expense for cuts in excess of this number must be defrayed by the author

References The citations should be grouped at the end of the manuscript under the *References* The citations should be numbered consecutively in the order of their appearance (their location in the text should be indicated by full sized figures included in parentheses) The sequence followed in the citations should be Author's name (with initials), name of publication volume number, page number and the date in parentheses Abbreviations for journals should conform to the style of *Chemical Abstracts* published by the American Chemical Society

(1) Author, A. Y., *Am. J. Physiol.* 79: 289 (1927)

Papers presented at the Sections of the AMERICAN PHARMACEUTICAL ASSOCIATION's annual meeting become the property of the ASSOCIATION and may at the discretion of the Editor be published in the JOURNAL Papers presented at these Sections may be published in other periodicals only after the release of the papers by the Board of Review of Papers of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The Editor will appreciate comments from Board of Review and Committee on Publication members, authors and others interested

An inspiring vista of the Columbia River and Gorge as seen from the Columbia River in Oregon Saturday, August 10th, will be an all-day scenic drive up Columbia River Highway, including a visit to the Bonneville Dam and an out-door luncheon featuring Columbia River salmon

If you have not planned for your trip to the Portland meeting of the A PH A you should do so promptly

John Ingalls.

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIV

JULY 1935

No 7

1885-1935

The 33rd annual meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION was held in Pittsburgh Pa , September 8, 1885 It was at this meeting that the third contribution on 'Precipitates in Fluidextracts' was presented by our senior member, J U Lloyd We now know the value of that research in pure and applied science Dr A B Prescott in commenting on this work said, 'The series of papers has been of great value,' he considered the work "a notable example of the fact that true research is reported from the field of applied science as well as that of pure science "

Mention is made of the foregoing, because during the more than sixty years our senior member served this ASSOCIATION he carried the message of pharmacy to the public, and by his writings and other activities the fact has never been permitted to dim that he was and is a pharmacist

John Ingalls, pharmacist of Macon, Ga , president of the AMERICAN PHARMACEUTICAL ASSOCIATION in 1885, was born in New Bern, N C , in 1829 where he received his earlier education and later engaged as clerk in a drug store Upon attaining majority he removed to Charleston, S C , and thereafter was engaged in a pharmacy in Columbia, first as clerk and then as proprietor In 1860, he became proprietor of a Macon, Ga pharmacy, until his death November 12 1898

Mr Ingalls was a courtly polished gentleman of the old school, and of unusual moral and physical courage He always endeavored to promote pharmacy, and gave his fellows a deeper appreciation of the profession and a high valuation of its service He took an active part in association work and served as president of Georgia Pharmaceutical Association Before his election as president of the A P H A , Mr Ingalls held vice presidential offices and afterward became a member of the Council

THE OREGON TRAIL

The Oregon Trail was an emigrant route about 2000 miles in length from Independence, Mo , to the Columbia River Originally, like many of the main roads of the country, it was made in some parts by Indians and trappers A part of it was blazed by Verendrye in 1742 and the expedition of Lewis and Clark in 1804

EDITORIAL

E G EBERLF, EDITOR

2215 Constitution Ave., WASHINGTON, D C

AFTER EIGHTY-THREE YEARS—PORTLAND

WHEN the AMERICAN PHARMACEUTICAL ASSOCIATION was organized, Oregon had not yet reached Statehood Its influence upon pharmacy in the great Pacific Northwest preceded its formal contact with the pharmacists of that delightful section of our country by eighty-three years We have enjoyed and profited by the influence of pharmacists of the West and Northwest for many years They have served as officers and committee members in the AMERICAN PHARMACEUTICAL ASSOCIATION and have taken active part in its major activities However, it remains for the 1935 Convention of the ASSOCIATION to cement by personal contact the bonds of friendship and professional relationship which have been fostered over the years between the pharmacists of the Northwest and the general membership of the ASSOCIATION

To many pharmacists of the Northwest the AMERICAN PHARMACEUTICAL ASSOCIATION has been largely a symbol, albeit an intangibly important factor in the progress of their profession Comparatively few have had the opportunity of actually participating in the deliberations of Sections and General Sessions Both the ASSOCIATION and the individual pharmacists of the Northwest have been losers through this lack of personal contact

It is significant that in these days of rapid change in our social and economic structure with its inevitable effect upon the future of the profession of pharmacy and the drug industry, the center of interest will be shifted momentarily from Washington, D C, to Portland, Oregon It will be a good thing for those engaged in the management of the affairs of the ASSOCIATION to gaze at the usual center of their activity from a distance of several thousand miles, and experience the advantages of the background of those who are for geographic reasons always several thousand miles distant from Washington Undoubtedly we of the East shall learn a great deal, and if in the learning we may also be privileged to impart a point of view and, perhaps, some specific information on some of the problems that confront us, our profession as a whole will profit measurably by the opportunity for interchange of opinions thus afforded

Pharmacy is beset by many problems and the economic situation has greatly intensified some of them We must face these problems squarely and we must solve them with courage and intelligence We expect the Pacific Northwest to supply the type of inspiration which carried the pioneers to the great heights that built an empire where once there was barrenness and waste We look forward to Portland with eager anticipation The eighty-third annual convention should make history —ROBERT P FISCHER, *President*, A PH A

CONTRIBUTORY PROFESSIONAL SERVICE

THE reports on Drug Extraction are being continued and in connection with the fundamental principles of the methods the extraction of a series of drugs of different types is being studied The subject has received consideration from

every angle and brings to the pharmacist a knowledge and understanding of the general processes of drug extraction

Several papers have recently dealt with the methods of drug administration and most careful observation has been made of the promptness with which certain forms of medications are effective and in that connection the value or insufficiency, usefulness or unfitness of certain administration forms

The determination of the reasonable or permissible margin of error in dispensing has been made the subject of comprehensive and detailed experimentation and research for a number of years and important information has been added to the records relative to utensils, apparatus and skill which may influence variation. The physical properties of the liquid, suspension or powder to be dispensed or compounded in the prescription have been carefully studied

Other points of prescription practice in articles of recent issues of the JOURNAL have reported the accuracy and speed factors in the filling of capsules by hand, the rate of disintegration in medicinal tablets and the variance of hypodermic tablets

Thus pharmacists owe much to their fellows in cooperative endeavors, and the contributors to the work of the AMERICAN PHARMACEUTICAL ASSOCIATION have promoted pharmacy and, because of the research, medicine, pharmacy, the laity and the profession have benefited

These thoughts have come forward, because each year the annual meetings carry messages and convey information which add to the sum and substance of knowledge and advance the cause of the profession and individuals therein engaged

The pharmacist profits by the information he communicates to his fellows and thereby advances the profession. What will your contributions be to the programs of the sections this year?

THE BLUE EAGLE AND THE NRA

JAMES L. O'NEILL, acting chief of the recovery agency, has indicated that there probably will be a continuation of the "Blue Eagle," perhaps as insignia of merit for industries carrying forward a certain standard

President Roosevelt has made it known in the press conferences that all matters pertaining to voluntary business agreements to replace the codes will be handled by the Federal Trade Commission. James L. O'Neill, recently appointed acting NRA Administrator, has stated that his organization will devote its activities largely to the compilation of the history of the two years of life and to gathering information, the "archives division" is in charge of Leon C. Marshall. Several proposed NRA bills are still under consideration but it is doubtful if they will be enacted into law during this session of Congress

The "Fair Trade Acts" are gradually being shaped to serve a most useful purpose, and with proper understanding and a determination to bring about what is intended, it is hoped, will result in helpful state measures, coordinated with other states in legalizing contracts which will establish a minimum price as an economic principle, and bring the public to a realization that price-cutting is destructive to seller and buyer, and that the effect is being impressed by untoward results, whereby the group or individual suffers

DRUG EXTRACTION III THE FUNCTION OF PRELIMINARY MACERATION IN RELATION TO THE PERCOLATION OF BELLADONNA ROOT ^{1 2}

BY WILLIAM J HUSA³ AND S B YATES⁴

As a part of the general study of the fundamental principles of drug extraction, which is being carried out in the Department of Pharmacy of the University of Florida, some of the factors influencing the extraction of belladonna root have been studied. The work reported in this paper deals with the function of maceration, both before and after packing the drug in the percolator, in relation to the percolation of belladonna root.

HISTORICAL REVIEW

Variations in U S P Percolation Methods—Since the introduction of the process of percolation in the U S P of 1840, changes have been made in the time of maceration.

TABLE I—VARIATIONS IN TIME OF PRELIMINARY MACERATION IN U S P PERCOLATION METHODS

U S P	Time of Maceration	
	Before Packing	After Packing

Moistening and Maceration before Packing—The moistening and preliminary maceration of a drug is one of the established steps in percolation. According to Couch (1) the purpose of preliminary maceration is to assist in packing, to allow a modification of the drug constituents and to insure the saturation of every particle of drug with menstruum so that the actual percolation may affect all the drug evenly.

In 1833 the Boullays, father and son (2) recommended that the drug be packed dry in the percolator. Dausse (3) in 1836 suggested that the powdered drug be moistened with half its

weight of cold water, and allowed to macerate for several hours before introducing it into the apparatus for extraction. In 1841 Deane (4) stated that no further maceration was required than might be necessary to complete the swelling process. Procter (5) recommended maceration before packing when using aqueous or weakly alcoholic menstrua, but not when percolating with alcohol or ether. In 1889 J. U. Lloyd (6) advocated that, in percolation with hydroalcoholic menstrua, the drug be macerated with water alone and that the alcohol necessary to bring the menstruum up to the proper strength be added just before packing.

In 1904 experiments were reported from Greenish's laboratory by Hooper (7) who moistened 200 Gm. portions of belladonna root with 50, 100- and 150-cc. portions of menstruum. It was found that extraction was most rapid when 50 cc. of menstruum was used to moisten 200 Gm. of drug. Later experiments by Todd (8) in which 100 Gm. of belladonna root in No. 40 powder was packed dry, and further 100-Gm. portions moistened with 50 cc. and 100 cc. respectively of menstruum, showed that most rapid extraction resulted from dry packing.

Bennett and Cocking (9) stated that "It is generally agreed that in small scale operation percolation proceeds more evenly and consequently a drug is exhausted more quickly when a relatively small quantity of menstruum is used to moisten it."

Recently the purpose and necessity of the moistening and maceration of the drug prior to packing has been questioned by W. L. Scoville (10).

Maceration after Packing in the Percolator—In 1864 Procter (11) approved of long maceration after packing the drug in the percolator. Likewise, Savage (12) in the same year showed by experiments with calumba, catechu, cinchona, cinnamon, gentian, myrrh, opium and rhubarb that long maceration produces a much more saturated first percolate. Camphell (13) in 1869 stated that the process of percolation is dependent on the important step of maceration. He moistened and packed the drug and allowed it to macerate for 4 days in a conical percolator previous to percolation. Taylor (14) in 1869 carried out experiments which indicated that long maceration was an important requirement for thorough and complete exhaustion of a drug by percolation.

Vacuum Maceration—In 1869 Duffield (15) advanced the idea that a more perfect maceration could be obtained if the ground drug were placed in a strong cylinder, the air pumped out and the requisite amount of menstruum admitted. He stated that "the pores of the comminuted drug give up the air enclosed in them and when the menstruum is allowed to flow in it is forced into these pores by the pressure of the air outside."

EXPERIMENTAL PART

The drug used was from a 125 pound shipment of belladonna root previously described (16).

Variation in the Amount of Moistening Liquid—Comparative percolations were carried out on 100 Gm. portions of belladonna root in No. 40 powder using varying amounts of menstruum for moistening the drug, but keeping all other factors as nearly constant as possible. The U. S. P. process for the preparation of the fluidextract was followed, using the menstruum of alcohol five volumes—water one volume, but with the variation that 80 cc. of reserve percolate was set aside in each case and further percolates collected in successive 100 cc. portions. The quantities of menstruum used in moistening the various 100 Gm. portions of the drug were as follows: 0, 25 cc., 60 cc. and 90 cc. Otherwise the U. S. P. details were followed, *i. e.*, the drug was allowed to macerate for 6 hours before packing in the percolator and 48 hours after packing. The successive percolates were collected without interruption.

TABLE II—EFFECT ON PERCOLATION OF THE AMOUNT OF LIQUID USED IN MOISTENING BELLADONNA ROOT FOR PRELIMINARY MACERATION

A. Gm. of Alkaloid in Various Portions of Percolate				
Percolates	0 *	25 Cc *	60 Cc *	90 Cc *
80 cc	0.411	0.434	0.460	0.281
100 cc	0.030	0.026	0.054	0.164
100 cc	0.004	0.008	0.006	0.006
100 cc	0.000	0.000	0.000	0.000
100 cc	0.000	0.000	0.000	0.000
Totals	0.445	0.468	0.520	0.451

* Quantity of menstruum used in moistening 100 Gm. of drug for preliminary maceration

B Gm of Total Extractive Contained in the Various Percolates				
Percolates	0 *	25 Cc *	60 Cc *	90 Cc *
80 cc	11 19	10 05	8 38	7 55
100 cc	8 41	8 43	8 95	7 45
100 cc	2 40	3 10	3 63	4 02
100 cc	0 95	1 24	1 54	1 99
100 cc	0 59	0 65	0 78	1 09
Totals	23 54	23 47	23 28	22 10

* Quantity of menstruum used in moistening 100 Gm of drug for preliminary maceration

C Per Cent of Total Alkaloid Contained in

Quantity of Menstruum Used for Moistening 100 Gm of Drug	First Percolate	First 2 Percolates	First 3 Percolates
0	92 4	99 1	100 0
25 cc	92 7	98 3	100 0
60 cc	88 5	98 9	100 0
90 cc	62 3	98 7	100 0

The results in Table II indicate that the rate of extraction of alkaloid is equally rapid when no liquid is used for moistening and when 25 cc is used for 100 Gm of drug. Using 60 cc there is a slight reduction in yield of alkaloid in the first percolate and using 90 cc there is a material reduction. In each case all the alkaloid is contained in the first 280 cc of percolate. The yield of total extractive in the reserve percolate varies inversely with the quantity of moistening liquid used.

The Function of Maceration before and after Packing in Relation to Percolation of Belladonna Root—The object of the following experiment was to determine the effect of varying the time of maceration, both before and after packing in the percolator on the rate of extraction of belladonna root.

100 Gm portions of belladonna root in No. 40 powder were percolated by the U. S. P. method for the preparation of fluidextract of belladonna root but varying the time of maceration as will be indicated, 80 cc of reserve percolate was collected in each case in ten hours and set aside, after which successive portions of 100 cc of percolate were collected three hours being taken for collection of each portion. In each case 60 cc of menstruum was used for moistening 100 Gm of drug.

Hours of Maceration Before Packing	Hours of Maceration After Packing	First Percolate	First 2 Percolates	First 3 Percolates
0	0	81 0	95 8	100 0
0	24	83 8	98 2	100 0
0	48	84 4	98 1	100 0
24	48	85 8	99 6	100 0

* The first number indicates the hours of maceration before packing in the percolator and the second number shows the number of hours of maceration after packing

The results in Table III clearly show that in the case of belladonna root in No. 40 powder maceration either before or after packing is not of appreciable value in promoting rapid extraction of alkaloids. The total extractive is higher in the reserve percolate in the batch that was macerated before and after packing, this advantage almost disappears by the time the fourth percolate is collected.

The Effect of Variations in Preliminary Maceration—100 Gm. portions of belladonna root in No. 40 powder were subjected to varying types of preliminary maceration as will be indicated. The drug was then packed in the percolator and percolation conducted immediately. In each case 80 cc. of percolate was collected in four hours after which successive 100-cc. portions were collected in two hour periods. The variations in preliminary maceration were as follows:

Sample A The drug was macerated with 60 cc. of the official menstruum for 6 hours before packing in the percolator.

Sample B The drug was macerated for 6 hours with water equivalent to 60 cc. of the official menstruum, the alcohol necessary to bring it up to the official menstruum strength being added just before packing.

Sample C A flask containing the drug was evacuated for 3 hours, using a Cenco Hyvac pump. Sixty cc. of the official menstruum was then added through a separatory funnel placed through the stopper, the flask being shaken until the powder appeared uniformly damp. The mixture was macerated for 6 hours. The drug was then packed and percolated immediately.

TABLE IV—EFFECT OF VARIATIONS IN PRELIMINARY MACERATION ON THE PERCOLATION OF BELLADONNA ROOT IN NO. 40 POWDER

Perco- lates	A Gm of Alkaloid in Various Portions of Percolate			B Gm of Total Extrac- tive Contained in		
	Sample A	Sample B	Sample C	Sample A	Sample B	Sample C
80 cc	0 382	0 378	0 406	8 55	7 31	8 18

Totals	0 465	0 480	0 478	28 11	27 17	28 51

C Per Cent of Total Alkaloid Contained in

Sample	First Percolate	First 2 Percolates	First 3 Percolates
A	82 2	93 1	100 0
B	78 8	98 3	100 0
C	84 9	98 5	100 0

The results in Table IV indicate that preliminary maceration with water alone, with subsequent addition of alcohol, has little or no advantage over maceration in the usual manner. Vacuum maceration also appears to offer no particular advantage, as far as present results go. The results show that slightly more alkaloid is extracted by vacuum maceration in the first percolate than by the usual method of maceration. However, all the alkaloid is contained in the first 280 cc. in each case.

DISCUSSION OF RESULTS

The results obtained in the present investigation show that dry packing works equally as well as moistening with 25 cc of liquid per 100 Gm of drug, but that extraction is slower with larger quantities of moistening liquid. Hooper's results (7) agree with these in showing that quantities above 25 cc decrease the rate of extraction. Todd's results (8) agree with these in showing that dry packing gives more rapid extraction than moistening with large proportions of liquid, but as Todd did not try any quantities of moistening liquid between 0 and 50 cc per 100 Gm of drug he failed to discover that moistening with small proportions of menstruum did not hinder extraction. The lack of advantage in moistening the drug verifies Scoville's contention (10) that the 6 hours of maceration before packing is not needed on account of rate of solubility or to allow time for osmosis. It would seem that in the case of powdered drugs which swell only slightly in the menstruum used the preliminary maceration serves no useful purpose.

In regard to the results on the quantity of moistening liquid used, it is interesting to note that similar results have been found for other drugs. Thus Lenton (17) found that in the percolation of coca leaves, on reducing the amount of menstruum used for moistening the drug, more than half of the alkaloid was obtained in the reserve percolate, while with the official British Pharmacopœial quantity of moistening liquid, the greater part of the alkaloid was contained in the "weak percolate." His results on *cimicifuga* and *aconite* were similar.

The previous workers in this field have failed to explain why an increase in the amount of moistening liquid decreases the rate of extraction. Considering the results in Table II it may be said that several factors have a bearing on the results. When no moistening liquid is used, it is evident that all of the liquid appearing as reserve percolate must traverse the entire column of drug. But when the drug is moistened before packing the result is that when percolation is started most of the liquid used in moistening reaches the bottom of the percolator without passing through the entire column of drug. When 90 cc of moistening liquid is used and 80 cc of reserve percolate collected it is obvious that more than 10 cc of the moistening liquid is still in the percolator when the reserve is set aside, and the portion remaining in the percolator is that which has traversed the greatest distance through the drug. However, when only 25 cc of moistening liquid was used, extraction of alkaloid was just as efficient as when the drug was packed dry. This would indicate that small quantities of moistening liquid may become rather fully saturated so that nothing would be gained by passing through more of the drug. But when more moistening liquid is used than can become saturated, the reserve percolate is less concentrated. From Table II, Part B, it is possible that certain easily soluble extractives dissolve in a very small amount of moistening liquid so that even 25 cc of moistening liquid results in dilution as far as these constituents are concerned, since the total extractive in the reserve percolate is reduced even by 25 cc of moistening liquid.

It is interesting to note that maceration after the liquid has begun to drop from the percolator is of very little benefit in the percolation of belladonna root with the official menstruum. This result is in accord with Huse and Magid's findings (16) that equilibrium is quickly attained in maceration with an excess of liquid. The results cast considerable doubt on the necessity and wisdom of the 48-hour macera-

tion period after packing as specified in the U S P X type processes A, B and C for fluidextracts. In the present tests, the results with 19 hours of percolation were equally as good as with 91 hours of combined maceration and percolation. This saving of time is of importance. J U Lloyd (18) found that percolation without maceration was best for the preparation of fluidextract of *cimicifuga*. It remains to be seen whether maceration in connection with percolation is important for other drugs. Probably the most logical way for the U S Pharmacopœial Revision Committee to handle this problem would be to introduce a type process for percolation without any maceration either before or after packing. This type process could be specified for only those drugs which are found from time to time to be extracted equally as rapidly and completely without maceration as with maceration.
